[13143] Another function of VGAM206 is therefore inhibition of Leucine Zipper, Down-regulated In Cancer 1 (LDOC1, Accession NM_012317). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LDOC1. Leucine-zipper-like Transcriptional Regulator, 1 (LZTR1, Accession NM_006767) is another VGAM206 host target gene. LZTR1 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by LZTR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LZTR1 BINDING SITE, designated SEQ ID:13640, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13144] Another function of VGAM206 is therefore inhibition of Leucine-zipper-like Transcriptional Regulator, 1 (LZTR1, Accession NM_006767). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LZTR1. Nyctalopin (NYX, Accession NM_022567) is another VGAM206 host target gene. NYX BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NYX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NYX BINDING SITE, designated SEQ ID:22889, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13145] Another function of VGAM206 is therefore inhibition of

Nyctalopin (NYX, Accession NM_022567), a gene which functions as the von willebrand factor receptor and mediates von willebrand factor-dependent platelet adhesion to blood vessels. the adhesion of platelets to injured vascular surfaces in the arterial circulation is a critical initiating event in hemostasis (by similarity). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NYX. The function of NYX has been established by previous studies. By positional cloning and the candidate gene approach, directed at the elucidation of the defect in complete congenital stationary night blindness (CSNB1; 310500), Bech-Hansen et al. (2000) identified a novel gene, NYX, that encodes a protein (nyctalopin) of 481 amino acids. Nyctalopin shows sequence similarity with members of the superfamily of proteins containing tandem arrays of the leucine-rich repeat (LRR) motif, as well as other features qualifying the protein as a member of the subfamily of small leucine-rich proteoglycans (SLRPs). By PCR amplification of tissue-specific cDNA, Bech-Hansen et al. (2000) detected expression of NYX in retina and kidney only. In the retina it appeared to be expressed in photoreceptors, bipolar and amacrine interneurons, and ganglion cells.

Pusch et al. (2000) likewise detected 14 different mutations. In 3 families the gene was partially deleted. They found expression of the gene at low levels in retina, brain, testis, and muscle.

[13146] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13147] Bech-Hansen, N. T.; Naylor, M. J.; Maybaum, T. A.; Sparkes, R. L.; Koop, B.; Birch, D. G.; Bergen, A. A. B.; Prinsen, C. F. M.; Polomeno, R. C.; Gal, A.; Drack, A. V.; Musarella, M. A.; Jacobson, S. G.; Young, R. S. L.; Weleber, R. G. : Mutations in NYX, encoding the leucine-rich proteoglycan nyctalopin, cause X-linked complete congenital stationary night blindness. *Nature Genet.* 26: 319-323, 2000. ; and

[13148] Pusch, C. M.; Zeitze, C.; Brandau, O.; Pesch, K.; Achatz, H.; Feil, S.; Scharfe, C.; Maurer, J.; Jacobi, F. K.; Pinckers, A.; Andreasson, S.; Hardcastle, A.; Wissinger, B.; Berger, W.;

[13149] Further studies establishing the function and utilities of NYX are found in John Hopkins OMIM database record ID 300278, and in cited publications numbered 10994-10995 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer-

ence. Optic Atrophy 1 (autosomal dominant) (OPA1, Accession NM_130835) is another VGAM206 host target gene. OPA1 BINDING SITE1 through OPA1 BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OPA1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPA1 BINDING SITE1 through OPA1 BINDING SITE5, designated SEQ ID:28340, SEQ ID:28324, SEQ ID:28356, SEQ ID:28348 and SEQ ID:28332 respectively, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13150] Another function of VGAM206 is therefore inhibition of Optic Atrophy 1 (autosomal dominant) (OPA1, Accession NM_130835). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPA1. PR Domain Containing 2, with ZNF Domain (PRDM2, Accession NM_012231) is another VGAM206 host target gene. PRDM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRDM2, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM2 BINDING SITE, designated SEQ ID:14537, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13151] Another function of VGAM206 is therefore inhibition of PR Domain Containing 2, with ZNF Domain (PRDM2, Accession NM_012231), a gene which plays a role in transcriptional regulation during neuronal differentiation and pathogenesis of retinoblastoma. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM2. The function of PRDM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120. Prostaglandin E Synthase (PTGES, Accession NM_004878) is another VGAM206 host target gene. PTGES BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTGES, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGES BINDING SITE, designated SEQ ID:11312, to the

nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13152] Another function of VGAM206 is therefore inhibition of Prostaglandin E Synthase (PTGES, Accession NM_004878). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGES. Prostaglandin I₂ (prostacyclin) Synthase (PTGIS, Accession NM_000961) is another VGAM206 host target gene. PTGIS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTGIS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGIS BINDING SITE, designated SEQ ID:6668, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13153] Another function of VGAM206 is therefore inhibition of Prostaglandin I₂ (prostacyclin) Synthase (PTGIS, Accession NM_000961), a gene which catalyzes the isomerization of prostaglandin h₂ to prostacyclin (= prostaglandin i₂). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with PTGIS. The function of PTGIS has been established by previous studies. Yokoyama et al. (1996) demonstrated that the prostacyclin synthase gene, which they symbolized PTGIS, consists of 10 exons spanning approximately 60 kb. All the splice donor and acceptor sites conformed to the GT/AG rule. The major product of the primer extension analysis suggested that the transcription of the gene started from the positions around 49 bp upstream of the translation initiation codon. By fluorescence in situ hybridization, they demonstrated that the gene is located at 20q13.11–q13.13. Prostacyclin (also known as prostaglandin I₂) is a potent vasodilator and inhibitor of platelet aggregation. The enzyme prostacyclin synthase (EC 5.3.99.4) catalyzes the isomerization of prostaglandin H₂ (PGH₂) to prostacyclin. Wang and Chen (1996) noted that although it has absorbance spectral features characteristic of the cytochrome P450s, PGIS has no monooxygenase activity and does not require an external source of electrons to initiate its enzyme reaction. Prostacyclin synthase is the single member of family 8 of the cytochrome P450 superfamily (Nelson et al., 1996).

[13154] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [13155] Wang, L.-H.; Chen, L. : Organization of the gene encoding human prostacyclin synthase. *Biochem. Biophys. Res. Commun.* 226: 631–637, 1996. ; and
- [13156] Yokoyama, C.; Yabuki, T.; Inoue, H.; Tone, Y.; Hara, S.; Hatae, T.; Nagata, M.; Takahashi, E.-I.; Tanabe, T. : Human gene encoding prostacyclin synthase (PTGIS): genomic organization, ch.
- [13157] Further studies establishing the function and utilities of PTGIS are found in John Hopkins OMIM database record ID 601699, and in cited publications numbered 670 and 2859–2861 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Peroxisomal Membrane Protein 3, 35kDa (Zellweger syndrome) (PXMP3, Accession NM_000318) is another VGAM206 host target gene. PXMP3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PXMP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PXMP3 BINDING SITE, designated SEQ ID:5860, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2917.

[13158] Another function of VGAM206 is therefore inhibition of Peroxisomal Membrane Protein 3, 35kDa (Zellweger syndrome) (PXMP3, Accession NM_000318). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PXMP3. RIG (Accession NM_006394) is another VGAM206 host target gene. RIG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RIG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RIG BINDING SITE, designated SEQ ID:13105, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13159] Another function of VGAM206 is therefore inhibition of RIG (Accession NM_006394), a gene which is ribosomal protein S15. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RIG. The function of RIG has been established by previous studies. The gene called Rig (rat insulinoma gene) was first isolated from a cDNA li-

brary of rat insulinomas. Its cognate gene has been found to be activated in various human tumors such as insulinomas, esophageal cancers, and colon cancers. Inoue et al. (1987) isolated a human insulinoma cDNA encoding the human homolog of RIG. Structural analysis indicated that the predicted 145-amino acid RIG protein may be a DNA-binding protein. Shiga et al. (1990) isolated the genomic sequence of human RIG from a genomic DNA library constructed from a human esophageal carcinoma and determined its complete nucleotide sequence. The gene is composed of about 3,000 nucleotides and divided into 4 exons separated by 3 introns. The transcription initiation site was located -46 bp upstream from the first ATG codon. Because of CpG islands in the 5-prime region and regions with a high GC content and because of the wide expression of RIG in tissues and cells, Shiga et al. (1990) suggested that RIG may belong to the class of 'housekeeping' genes, whose products are necessary for the growth of all cell types. The human genome contains at least 6 copies of RIG pseudogenes, 4 of which have the characteristics of processed pseudogenes. Kitagawa et al. (1991) demonstrated the normal function of RIG. They showed that the immunoreactivity to a monoclonal antibody

against the deduced Rig protein and the translation product of Rig mRNA comigrated with ribosomal protein S15. The amino acid sequence of ribosomal protein S15 purified from rat liver coincided with that deduced from the nucleotide sequence of Rig mRNA, but there were indications that the initiator methionine was removed and the succeeding alanyl residue was monoacetylated. The authors concluded that the product of the Rig gene is ribosomal protein S15. Animal model experiments lend further support to the function of RIG. By somatic cell hybrid and radiation hybrid mapping analyses, Kenmochi et al. (1998) mapped the human RPS15 gene to 19p.

[13160] It is appreciated that the abovementioned animal model for RIG is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[13161] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13162] Kitagawa, M.; Takasawa, S.; Kikuchi, N.; Itoh, T.; Teraoka, H.; Yamamoto, H.; Okamoto, H. : Rig encodes ribosomal protein S15: the primary structure of mammalian ribosomal protein S15. FEBS Lett. 283: 210–214, 1991. ; and

- [13164] Further studies establishing the function and utilities of RIG are found in John Hopkins OMIM database record ID 180535, and in cited publications numbered 1239 and 12396–12397 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RNA (guanine–7–) Methyltransferase (RNMT, Accession NM_003799) is another VGAM206 host target gene. RNMT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNMT BINDING SITE, designated SEQ ID:9891, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.
- [13165] Another function of VGAM206 is therefore inhibition of RNA (guanine–7–) Methyltransferase (RNMT, Accession NM_003799), a gene which catalyzes the methylation of GpppN– at the guanine N7 position. Accordingly, utilities

of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNMT. The function of RNMT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178.SHC (Src homology 2 domain containing) Transforming Protein 1 (SHC1, Accession NM_003029) is another VGAM206 host target gene. SHC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SHC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SHC1 BINDING SITE, designated SEQ ID:8972, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13166] Another function of VGAM206 is therefore inhibition of SHC (Src homology 2 domain containing) Transforming Protein 1 (SHC1, Accession NM_003029), a gene which couples activated growth factor receptors to a signaling pathway. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHC1. The function of SHC1

and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM53. Solute Carrier Family 1 (neuronal/epithelial high affinity glutamate transporter, system Xag), Member 1 (SLC1A1, Accession NM_004170) is another VGAM206 host target gene. SLC1A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A1 BINDING SITE, designated SEQ ID:10380, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13167] Another function of VGAM206 is therefore inhibition of Solute Carrier Family 1 (neuronal/epithelial high affinity glutamate transporter, system Xag), Member 1 (SLC1A1, Accession NM_004170), a gene which is a glutamate transporter, essential for terminating the postsynaptic action of glutamate by rapidly removing it from the synaptic cleft. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with SLC1A1. The function of SLC1A1 has been established by previous studies. High-affinity glutamate transporters play an essential role in transporting glutamate across plasma membranes. In brain, these transporters are crucial in terminating the action of the excitatory neurotransmitter glutamate and in maintaining extracellular glutamate concentrations below neurotoxic levels. Functional defects of high-affinity glutamate transporters have been suggested to be involved in the pathophysiology of amyotrophic lateral sclerosis (OMIM Ref. No. 105400). In small intestine and kidney, in which the high-affinity glutamate transporter mediates net absorption of glutamate and aspartate across epithelial cells, an inborn error of glutamate transport is thought to cause dicarboxylicaminoaciduria (OMIM Ref. No. 222730). Kanai and Hediger (1992) isolated a cDNA encoding a high-affinity glutamate transporter, designated EAAC1, that also transports aspartate but not other amino acids. EAAC1 was found to be uniquely expressed throughout the body, particularly in brain (neurons), intestine, and kidney. By Southern analysis of a panel of human/rodent somatic cell hybrids and by fluorescence in situ hybridization (FISH), Smith et al. (1994) mapped the EAAC1 gene to 9p24. They

suggested that mutations in this gene may be responsible for dicarboxylicaminoaciduria or for a form of familial ALS separate from the form due to mutation in the SOD1 gene (OMIM Ref. No. 147450) on chromosome 21. Lin et al. (2001) used a yeast 2-hybrid assay to identify a protein that interacts with EAAC1. This protein, termed GTRAP3-18 (OMIM Ref. No. 605709), is expressed in numerous tissues, localizes to the cell membrane and cytoplasm, and specifically interacts with the carboxy-terminal intracellular domain of EAAC1. Increasing the expression of GTRAP3-18 in cells reduces EAAC1-mediated glutamate transport by lowering substrate affinity. The expression of GTRAP3-18 can be upregulated by retinoic acid, which results in a specific reduction of EAAC1-mediated glutamate transport. Lin et al. (2001) concluded that glutamate transport proteins can be regulated potently and that GTRAP can modulate the transport functions ascribed to EAAC1. GTRAP3-18 may be important in regulating the metabolic functions of EAAC1.

[13168] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13169] Kanai, Y.; Hediger, M. A. : Primary structure and functional

characterization of a high-affinity glutamate transporter.

Nature 360: 467-471, 1992. ; and

[13170] Smith, C. P.; Weremowicz, S.; Kanai, Y.; Stelzner, M.; Morton, C. C.; Hediger, M. A. : Assignment of the gene coding for the human high-affinity glutamate transporter EAAC1 to 9p24: pot.

[13171] Further studies establishing the function and utilities of SLC1A1 are found in John Hopkins OMIM database record ID 133550, and in cited publications numbered 3585-3587 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 2 (facilitated glucose/fructose transporter), Member 5 (SLC2A5, Accession NM_003039) is another VGAM206 host target gene. SLC2A5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC2A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC2A5 BINDING SITE, designated SEQ ID:9001, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13172] Another function of VGAM206 is therefore inhibition of

Solute Carrier Family 2 (facilitated glucose/fructose transporter), Member 5 (SLC2A5, Accession NM_003039), a gene which has probable role as a fructose transporter. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC2A5. The function of SLC2A5 has been established by previous studies. Davidson et al. (1992) showed that the glucose transporter isoform, GLUT5, is expressed on the brush border membrane of human small intestinal enterocytes. Burant et al. (1992) showed further that GLUT5 is a fructose transporter and may be largely responsible for the uptake of fructose from the lumen of the small intestine. GLUT2, which is present on the basolateral membrane of enterocytes, probably mediates the efflux of fructose from these cells. In addition, GLUT5 is probably responsible for the uptake of fructose by spermatozoa. The pattern of GLUT5 immunoreactivity in maturing spermatids suggested that the expression of GLUT5 may serve as a marker for terminal maturation of male germ cells. An increasing fraction of calories consumed in Western diets is derived from fructose. Increases in fructose consumption have been implicated in a rising incidence of hypertriglyceridemia and hyperinsulinemia. Mu-

tations in the small intestinal sodium/glucose cotransporter (OMIM Ref. No. 182380), which effectively abolish glucose uptake, have no effect on the absorption of fructose, indicating a separate fructose carrier protein. Using cDNA probes for Southern blotting of DNA from somatic cell hybrids and for in situ hybridization, Fan et al. (1989) showed that the GLUT5 gene (also symbolized SLC2A5) is located on chromosome 1. Also see Kayano et al. (1990). White et al. (1998) concluded that the correct assignment of SLC2A5 is 1p36.2. This was confirmed by use of somatic cell and radiation hybrid mapping panels and was consistent with previous EST mapping data. The carbonic anhydrase-6 (CA6; 114780) and alpha-enolase (ENO1; 172430) genes were physically linked to SLC2A5 in yeast- and P1-artificial chromosome (YAC and PAC) contigs. PACs from the contig were mapped to 1p36.2 by fluorescence in situ hybridization.

[13173] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13174] Davidson, N. O.; Hausman, A. M. L.; Ifkovits, C. A.; Buse, J. B.; Gould, G. W.; Burant, C. F.; Bell, G. I. : Human intestinal glucose transporter expression and localization of GLUT5.

Am. J. Physiol. 262: C795–C800, 1992. ; and

[13175] White, P. S.; Jensen, S. J.; Rajalingam, V.; Stairs, D.; Sulman, E. P.; Maris, J. M.; Biegel, J. A.; Wooster, R.; Brodeur, G. M. : Physical mapping of the CA6, ENO1, and SLC2A5 (GLUT5) gene.

[13176] Further studies establishing the function and utilities of SLC2A5 are found in John Hopkins OMIM database record ID 138230, and in cited publications numbered 12195–12196, 1190 and 11911 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 1 (antiporter, Na⁺/H⁺, amiloride sensitive) (SLC9A1, Accession XM_046881) is another VGAM206 host target gene. SLC9A1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC9A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC9A1 BINDING SITE, designated SEQ ID:34856, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13177] Another function of VGAM206 is therefore inhibition of

Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 1 (antiporter, Na^+/H^+ , amiloride sensitive) (SLC9A1, Accession XM_046881), a gene which is involved in pH regulation to eliminate acids generated by active metabolism or to counter adverse environmental conditions. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC9A1. The function of SLC9A1 has been established by previous studies. Denker et al. (2000) showed that the plasma membrane ion exchanger NHE1 acts as an anchor for actin filaments to control the integrity of the cortical cytoskeleton. This occurs through a previously unrecognized structural link between NHE1 and the actin-binding proteins ezrin (OMIM Ref. No. 123900), radixin (OMIM Ref. No. 179410), and moesin (OMIM Ref. No. 309845), which are collectively referred to as ERM proteins. NHE1 and ERM proteins were found to associate directly and colocalize in lamellipodia. Fibroblasts expressing NHE1 with mutations that disrupted binding with ERM proteins but not ion translocation had impaired organization of focal adhesions and actin stress fibers and an irregular cell shape. Denker et al. (2000) proposed a structural role for NHE1 in regulating the cortical cy-

toskeleton that is independent of its function as an ion exchanger. The genomic probe reported by Mattei et al. (1987) was used to map the APNH gene to 1p36.1–p35 by in situ hybridization (Mattei et al., 1988). Mattei et al. (1989) used in situ hybridization of the human cDNA probe to map the antiporter gene to the distal portion of mouse chromosome 4 and to the long arm of Chinese hamster chromosome 2, confirming the conserved homology between the distal part of human chromosome 1p, the mouse distal 4, and Chinese hamster distal 2q. By the analysis of fragment length variations in recombinant inbred strains, Morahan and Rakar (1993) likewise mapped the Nhe1 gene to mouse chromosome 4, between Lck and Akp2. Lifton et al. (1990) used genomic clones of the SLC9A1 gene to identify 2 polymorphisms. Using these RFLPs in 59 reference families, they found that the antiporter gene lies 3 cM proximal to the RH locus. Dudley et al. (1990) PCR-amplified a 376-bp fragment corresponding to the 5-prime end of SLC9A1 and detected a polymorphism within this fragment by denaturing gradient gel electrophoresis. By genetic linkage studies, they mapped SLC9A1 telomeric to D1S57 and close to RH (OMIM Ref. No. 111700) and ALPL (OMIM Ref. No.

171760). They pointed out that SLC9A1 is a plausible candidate gene for human essential hypertension.

[13178] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13179] Denker, S. P.; Huang, D. C.; Orlowski, J.; Furthmayr, H.; Barber, D. L. : Direct binding of the Na-H exchanger NHE1 to ERM proteins regulates the cortical cytoskeleton and cell shape independently of H(+) translocation. Molec. Cell 6: 1425-1436, 2000. ; and

[13180] Dudley, C. R. K.; Giuffra, L. A.; Tippet, P.; Kidd, K. K.; Reenders, S. T. : The Na⁺/H⁺ antiporter: a 'melt' polymorphism allows regional mapping to the short arm of chromosome 1. Hum. G.

[13181] Further studies establishing the function and utilities of SLC9A1 are found in John Hopkins OMIM database record ID 107310, and in cited publications numbered 4068-4077 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily C, Member 1 (SMARCC1, Accession NM_003074) is another VGAM206 host target gene. SMARCC1 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by SMARCC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMARCC1 BINDING SITE, designated SEQ ID:9042, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13182] Another function of VGAM206 is therefore inhibition of SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily C, Member 1 (SMARCC1, Accession NM_003074), a gene which is involved in chromatin remodeling. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCC1. The function of SMARCC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57. Steroidogenic Acute Regulatory Protein (STAR, Accession NM_000349) is another VGAM206 host target gene. STAR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STAR, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAR BINDING SITE, designated SEQ ID:5905, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13183] Another function of VGAM206 is therefore inhibition of Steroidogenic Acute Regulatory Protein (STAR, Accession NM_000349). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAR. Transporter 2, ATP-binding Cassette, Sub-family B (MDR/TAP) (TAP2, Accession NM_000544) is another VGAM206 host target gene. TAP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAP2 BINDING SITE, designated SEQ ID:6143, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13184] Another function of VGAM206 is therefore inhibition of Transporter 2, ATP-binding Cassette, Sub-family B (MDR/TAP) (TAP2, Accession NM_000544), a gene which is

involved in the transport of antigens from the cytoplasm to a membrane-bound compartment for association with mhc class i molecules. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAP2. The function of TAP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. Tight Junction Protein 1 (zona occludens 1) (TJP1, Accession NM_003257) is another VGAM206 host target gene. TJP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TJP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TJP1 BINDING SITE, designated SEQ ID:9267, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13185] Another function of VGAM206 is therefore inhibition of Tight Junction Protein 1 (zona occludens 1) (TJP1, Accession NM_003257), a gene which colocalizes and interacts with cadherins in cells lacking tight junctions. Accordingly, utilities of VGAM206 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with TJP1. The function of TJP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95. Ubiquitin-like 1 (sentrin) (UBL1, Accession NM_003352) is another VGAM206 host target gene. UBL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBL1 BINDING SITE, designated SEQ ID:9380, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13186] Another function of VGAM206 is therefore inhibition of Ubiquitin-like 1 (sentrin) (UBL1, Accession NM_003352), a gene which generates proteins resistant to degradation through its modification. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBL1. The function of UBL1 has been established by previous studies. Activation of NF-kappa-B is achieved by ubiquitination and proteasome-mediated degradation of I-

kappa-B-alpha (OMIM Ref. No. 164008). Desterro et al. (1998) detected modified I-kappa-B-alpha, conjugated to the small ubiquitin-like protein SUMO1, which is resistant to signal-induced degradation. Overexpression of SUMO1 inhibits signal-induced activation of NF-kappa-B-dependent transcription. SUMO1 modification of I-kappa-B-alpha is inhibited by phosphorylation. Thus, while ubiquitination targets proteins for rapid degradation, SUMO1 modification acts antagonistically to generate proteins resistant to degradation. Many antibiotics, anti-cancer drugs, toxins, carcinogens, and physiologic stresses abort the catalytic cycles of topoisomerases (see OMIM Ref. No. TOP1, 126420), resulting in topoisomerase-mediated DNA damage. Mao et al. (2000) showed that camptothecin, a TOP1-specific poison, can induce rapid and extensive conjugation of SUMO1 to human DNA. This and other observations suggested that SUMO1 may be involved in the repair of TOP1-mediated DNA damage.

[13187] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13188] Desterro, J. M. P.; Rodriguez, M. S.; Hay, R. T. : SUMO-1 modification of I-kappa-B-alpha inhibits NF-kappa-B ac-

tivation. Molec. Cell 2: 233–239, 1998. ; and

[13189] Mao, Y.; Sun, M.; Desai, S. D.; Liu, L. F. : SUMO–1 conjugation to topoisomerase I: a possible repair response to topoisomerase–mediated DNA damage. Proc. Nat. Acad. Sci. 97: 4046–4051.

[13190] Further studies establishing the function and utilities of UBL1 are found in John Hopkins OMIM database record ID 601912, and in cited publications numbered 9134–9139 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Uracil–DNA Glycosylase (UNG, Accession NM_003362) is another VGAM206 host target gene. UNG BINDING SITE1 and UNG BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by UNG, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UNG BINDING SITE1 and UNG BINDING SITE2, designated SEQ ID:9390 and SEQ ID:28128 respectively, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13191] Another function of VGAM206 is therefore inhibition of Uracil–DNA Glycosylase (UNG, Accession NM_003362), a

gene which excises uracil residues from the dna to prevent mutagenesis and initiate the base-excision repair (BER) pathway. Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNG. The function of UNG has been established by previous studies. Uracil DNA glycosylase removes uracil in DNA resulting from deamination of cytosine or replicative incorporation of dUMP instead of dTMP (Haug et al., 1996). Animal model experiments lend further support to the function of UNG. Nilsen et al. (2000) generated knockout mice lacking Ung. In contrast to Ung – mutants of bacteria and yeast, these mice did not exhibit a greatly increased spontaneous mutation frequency. There was, however, only slow removal of uracil from misincorporated dUMP in isolated Ung –/– nuclei and an elevated steady-state level of uracil in DNA in dividing Ung –/– cells. A backup uracil-excising activity in tissue extracts from Ung null mice, with properties indistinguishable from the mammalian SMUG1 DNA glycosylase, may account for the repair of premutagenic U:G mispairs resulting from cytosine deamination in vivo. The authors suggested that the nuclear UNG protein has evolved a specialized role in mammalian cells counteract–

ing U:A base pairs formed by use of dUTP during DNA synthesis.

[13192] It is appreciated that the abovementioned animal model for UNG is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[13193] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13194] Haug, T.; Skorpen, F.; Kvaloy, K.; Eftedal, I.; Lund, H.; Krokan, H. E. : Human uracil–DNA glycosylase gene: sequence organization, methylation pattern, and mapping to chromosome 12q23–q24.1. *Genomics* 36: 408–416, 1996. ; and

[13195] Nilsen, H.; Rosewell, I.; Robins, P.; Skjelbred, C. F.; Andersen, S.; Slupphaug, G.; Daly, G.; Krokan, H. E.; Lindahl, T.; Barnes, D. E. : Uracil–DNA glycosylase (UNG)–deficient mice rev.

[13196] Further studies establishing the function and utilities of UNG are found in John Hopkins OMIM database record ID 191525, and in cited publications numbered 12619–12626 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc

Finger Protein 74 (Cos52) (ZNF74, Accession NM_003426) is another VGAM206 host target gene. ZNF74 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF74, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF74 BINDING SITE, designated SEQ ID:9471, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13197] Another function of VGAM206 is therefore inhibition of Zinc Finger Protein 74 (Cos52) (ZNF74, Accession NM_003426). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF74. ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 13 (ABCC13, Accession NM_138726) is another VGAM206 host target gene. ABCC13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ABCC13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCC13 BINDING SITE, designated SEQ

ID:28974, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13198] Another function of VGAM206 is therefore inhibition of ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 13 (ABCC13, Accession NM_138726). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCC13. Amyotrophic Lateral Sclerosis 2 (juvenile) Chromosome Region, Candidate 3 (ALS2CR3, Accession NM_015049) is another VGAM206 host target gene. ALS2CR3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ALS2CR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALS2CR3 BINDING SITE, designated SEQ ID:17414, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13199] Another function of VGAM206 is therefore inhibition of Amyotrophic Lateral Sclerosis 2 (juvenile) Chromosome Region, Candidate 3 (ALS2CR3, Accession NM_015049).

Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALS2CR3. AP1 Gamma Subunit Binding Protein 1 (AP1GBP1, Accession NM_080551) is another VGAM206 host target gene. AP1GBP1 BINDING SITE1 through AP1GBP1 BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AP1GBP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP1GBP1 BINDING SITE1 through AP1GBP1 BINDING SITE5, designated SEQ ID:27882, SEQ ID:27874, SEQ ID:14118, SEQ ID:27873 and SEQ ID:14119 respectively, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13200] Another function of VGAM206 is therefore inhibition of AP1 Gamma Subunit Binding Protein 1 (AP1GBP1, Accession NM_080551). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1GBP1. Chromosome 20 Open Reading Frame 164 (C20orf164, Accession XM_086633) is another VGAM206 host target gene.

C20orf164 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C20orf164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf164 BINDING SITE, designated SEQ ID:38802, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13201] Another function of VGAM206 is therefore inhibition of Chromosome 20 Open Reading Frame 164 (C20orf164, Accession XM_086633). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf164. Chromosome 20 Open Reading Frame 177 (C20orf177, Accession XM_030726) is another VGAM206 host target gene. C20orf177 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf177, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf177 BINDING SITE, designated SEQ ID:31129, to the nucleotide sequence of VGAM206 RNA,

herein designated VGAM RNA, also designated SEQ ID:2917.

[13202] Another function of VGAM206 is therefore inhibition of Chromosome 20 Open Reading Frame 177 (C20orf177, Accession XM_030726). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf177. COAS3 (Accession NM_139020) is another VGAM206 host target gene. COAS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COAS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COAS3 BINDING SITE, designated SEQ ID:29123, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13203] Another function of VGAM206 is therefore inhibition of COAS3 (Accession NM_139020). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COAS3. COP9 Constitutive Photomorphogenic Homolog Subunit 7B (Arabidopsis) (COPS7B, Accession NM_022730) is an–

other VGAM206 host target gene. COPS7B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COPS7B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COPS7B BINDING SITE, designated SEQ ID:22932, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13204] Another function of VGAM206 is therefore inhibition of COP9 Constitutive Photomorphogenic Homolog Subunit 7B (Arabidopsis) (COPS7B, Accession NM_022730). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COPS7B. CSL4 (Accession NM_016046) is another VGAM206 host target gene. CSL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSL4 BINDING SITE, designated SEQ ID:18126, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA,

also designated SEQ ID:2917.

[13205] Another function of VGAM206 is therefore inhibition of CSL4 (Accession NM_016046). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSL4. Doublecortin and CaM Kinase-like 1 (DCAMKL1, Accession NM_004734) is another VGAM206 host target gene. DCAMKL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DCAMKL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCAMKL1 BINDING SITE, designated SEQ ID:11113, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13206] Another function of VGAM206 is therefore inhibition of Doublecortin and CaM Kinase-like 1 (DCAMKL1, Accession NM_004734). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCAMKL1. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 34 (DDX34, Accession NM_014681) is another VGAM206 host target

gene. DDX34 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DDX34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX34 BINDING SITE, designated SEQ ID:16159, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13207] Another function of VGAM206 is therefore inhibition of DEAD/H (Asp–Glu–Ala–Asp/His) Box Polypeptide 34 (DDX34, Accession NM_014681). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX34. DKFZp434C0328 (Accession NM_017577) is another VGAM206 host target gene. DKFZp434C0328 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp434C0328, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434C0328 BINDING SITE, designated SEQ ID:19016, to the nucleotide sequence of VGAM206

RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13208] Another function of VGAM206 is therefore inhibition of DKFZp434C0328 (Accession NM_017577). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434C0328. DKFZP434H132 (Accession XM_057020) is another VGAM206 host target gene. DKFZP434H132 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434H132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434H132 BINDING SITE, designated SEQ ID:36451, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13209] Another function of VGAM206 is therefore inhibition of DKFZP434H132 (Accession XM_057020). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434H132. DKFZP434L1435 (Accession XM_175250) is another VGAM206 host target gene. DK-

FZP434L1435 BINDING SITE1 through DKFZP434L1435 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DKFZP434L1435, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434L1435 BINDING SITE1 through DKFZP434L1435 BINDING SITE3, designated SEQ ID:46703, SEQ ID:44269 and SEQ ID:46665 respectively, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13210] Another function of VGAM206 is therefore inhibition of DKFZP434L1435 (Accession XM_175250). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434L1435. DKFZP564I052 (Accession XM_039660) is another VGAM206 host target gene. DKFZP564I052 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564I052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I052 BINDING SITE, des-

ignated SEQ ID:33137, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13211] Another function of VGAM206 is therefore inhibition of DKFZP564I052 (Accession XM_039660). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I052. DnaJ (Hsp40) Homolog, Subfamily A, Member 2 (DNAJA2, Accession XM_007963) is another VGAM206 host target gene. DNAJA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNAJA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAJA2 BINDING SITE, designated SEQ ID:30069, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13212] Another function of VGAM206 is therefore inhibition of DnaJ (Hsp40) Homolog, Subfamily A, Member 2 (DNAJA2, Accession XM_007963). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJA2. Docking

Protein 4 (DOK4, Accession NM_018110) is another VGAM206 host target gene. DOK4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DOK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DOK4 BINDING SITE, designated SEQ ID:19881, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13213] Another function of VGAM206 is therefore inhibition of Docking Protein 4 (DOK4, Accession NM_018110). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOK4. Down Syndrome Critical Region Gene 1-like 1 (DSCR1L1, Accession NM_005822) is another VGAM206 host target gene. DSCR1L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DSCR1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSCR1L1 BINDING SITE, designated SEQ ID:12432, to the nucleotide

sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13214] Another function of VGAM206 is therefore inhibition of Down Syndrome Critical Region Gene 1-like 1 (DSCR1L1, Accession NM_005822). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSCR1L1. Eukaryotic Translation Initiation Factor 5 (EIF5, Accession NM_001969) is another VGAM206 host target gene. EIF5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EIF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF5 BINDING SITE, designated SEQ ID:7699, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13215] Another function of VGAM206 is therefore inhibition of Eukaryotic Translation Initiation Factor 5 (EIF5, Accession NM_001969). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF5. FLJ10477 (Accession NM_018105) is another VGAM206 host target gene.

FLJ10477 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10477 BINDING SITE, designated SEQ ID:19875, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13216] Another function of VGAM206 is therefore inhibition of FLJ10477 (Accession NM_018105). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10477. FLJ10781 (Accession NM_018215) is another VGAM206 host target gene. FLJ10781 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10781, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10781 BINDING SITE, designated SEQ ID:20140, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13217] Another function of VGAM206 is therefore inhibition of FLJ10781 (Accession NM_018215). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10781. FLJ10898 (Accession XM_002486) is another VGAM206 host target gene. FLJ10898 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10898, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10898 BINDING SITE, designated SEQ ID:29895, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13218] Another function of VGAM206 is therefore inhibition of FLJ10898 (Accession XM_002486). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10898. FLJ12221 (Accession XM_031342) is another VGAM206 host target gene. FLJ12221 BINDING SITE1 and FLJ12221 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ12221, corresponding to HOST TARGET binding sites such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12221 BINDING SITE1 and FLJ12221 BINDING SITE2, designated SEQ ID:31348 and SEQ ID:31347 respectively, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13219] Another function of VGAM206 is therefore inhibition of FLJ12221 (Accession XM_031342). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12221. FLJ12484 (Accession NM_022767) is another VGAM206 host target gene. FLJ12484 BINDING SITE1 through FLJ12484 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ12484, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12484 BINDING SITE1 through FLJ12484 BINDING SITE4, designated SEQ ID:23021, SEQ ID:34519, SEQ ID:23022 and SEQ ID:34520 respectively, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13220] Another function of VGAM206 is therefore inhibition of

FLJ12484 (Accession NM_022767). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12484. FLJ12707 (Accession NM_022067) is another VGAM206 host target gene. FLJ12707 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12707, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12707 BINDING SITE, designated SEQ ID:22609, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13221] Another function of VGAM206 is therefore inhibition of FLJ12707 (Accession NM_022067). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12707. FLJ13096 (Accession NM_025000) is another VGAM206 host target gene. FLJ13096 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13096, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ13096 BINDING SITE, designated SEQ ID:24569, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13222] Another function of VGAM206 is therefore inhibition of FLJ13096 (Accession NM_025000). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13096. FLJ13984 (Accession NM_024770) is another VGAM206 host target gene. FLJ13984 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13984, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13984 BINDING SITE, designated SEQ ID:24131, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13223] Another function of VGAM206 is therefore inhibition of FLJ13984 (Accession NM_024770). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13984. FLJ14457 (Accession NM_032788) is another VGAM206

host target gene. FLJ14457 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ14457, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14457 BINDING SITE, designated SEQ ID:26543, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13224] Another function of VGAM206 is therefore inhibition of FLJ14457 (Accession NM_032788). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14457. FLJ20051 (Accession NM_019087) is another VGAM206 host target gene. FLJ20051 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20051, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20051 BINDING SITE, designated SEQ ID:21164, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13225] Another function of VGAM206 is therefore inhibition of FLJ20051 (Accession NM_019087). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20051. FLJ20508 (Accession NM_017850) is another VGAM206 host target gene. FLJ20508 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20508 BINDING SITE, designated SEQ ID:19521, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13226] Another function of VGAM206 is therefore inhibition of FLJ20508 (Accession NM_017850). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20508. FLJ20984 (Accession NM_024630) is another VGAM206 host target gene. FLJ20984 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20984, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20984 BINDING SITE, designated SEQ ID:23896, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13227] Another function of VGAM206 is therefore inhibition of FLJ20984 (Accession NM_024630). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20984. FLJ21302 (Accession NM_022901) is another VGAM206 host target gene. FLJ21302 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21302, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21302 BINDING SITE, designated SEQ ID:23187, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13228] Another function of VGAM206 is therefore inhibition of FLJ21302 (Accession NM_022901). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21302.

FLJ22283 (Accession NM_032220) is another VGAM206 host target gene. FLJ22283 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22283 BINDING SITE, designated SEQ ID:25948, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13229] Another function of VGAM206 is therefore inhibition of FLJ22283 (Accession NM_032220). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22283. FLJ31951 (Accession NM_144726) is another VGAM206 host target gene. FLJ31951 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ31951, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31951 BINDING SITE, designated SEQ ID:29553, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2917.

[13230] Another function of VGAM206 is therefore inhibition of FLJ31951 (Accession NM_144726). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31951. Golgi Autoantigen, Golgin Subfamily A, 1 (GOLGA1, Accession NM_002077) is another VGAM206 host target gene. GOLGA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GOLGA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLGA1 BINDING SITE, designated SEQ ID:7866, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13231] Another function of VGAM206 is therefore inhibition of Golgi Autoantigen, Golgin Subfamily A, 1 (GOLGA1, Accession NM_002077). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGA1. HTGN29 (Accession NM_020199) is another VGAM206 host target gene. HTGN29 BINDING SITE is HOST TARGET binding site

found in the 5` untranslated region of mRNA encoded by HTGN29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTGN29 BINDING SITE, designated SEQ ID:21434, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13232] Another function of VGAM206 is therefore inhibition of HTGN29 (Accession NM_020199). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTGN29. Interleukin 14 (IL14, Accession XM_170924) is another VGAM206 host target gene. IL14 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IL14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL14 BINDING SITE, designated SEQ ID:45703, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13233] Another function of VGAM206 is therefore inhibition of

Interleukin 14 (IL14, Accession XM_170924). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL14. KBRAS2 (Accession NM_017595) is another VGAM206 host target gene. KBRAS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KBRAS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KBRAS2 BINDING SITE, designated SEQ ID:19048, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13234] Another function of VGAM206 is therefore inhibition of KBRAS2 (Accession NM_017595). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KBRAS2. Potassium Voltage-gated Channel, Shab-related Subfamily, Member 2 (KCNB2, Accession XM_171186) is another VGAM206 host target gene. KCNB2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCNB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNB2 BINDING SITE, designated SEQ ID:45965, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13235] Another function of VGAM206 is therefore inhibition of Potassium Voltage-gated Channel, Shab-related Subfamily, Member 2 (KCNB2, Accession XM_171186). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNB2. KIAA0227 (Accession XM_027236) is another VGAM206 host target gene. KIAA0227 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0227, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0227 BINDING SITE, designated SEQ ID:30457, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13236] Another function of VGAM206 is therefore inhibition of KIAA0227 (Accession XM_027236). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0227. KIAA0332 (Accession XM_031553) is another VGAM206 host target gene. KIAA0332 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0332 BINDING SITE, designated SEQ ID:31419, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13237] Another function of VGAM206 is therefore inhibition of KIAA0332 (Accession XM_031553). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0332. KIAA0416 (Accession NM_015564) is another VGAM206 host target gene. KIAA0416 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0416 BINDING SITE, designated SEQ ID:17839, to the

nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13238] Another function of VGAM206 is therefore inhibition of KIAA0416 (Accession NM_015564). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0416. KIAA0469 (Accession NM_014851) is another VGAM206 host target gene. KIAA0469 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0469, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0469 BINDING SITE, designated SEQ ID:16896, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13239] Another function of VGAM206 is therefore inhibition of KIAA0469 (Accession NM_014851). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0469. KIAA0620 (Accession XM_030707) is another VGAM206 host target gene. KIAA0620 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0620, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0620 BINDING SITE, designated SEQ ID:31121, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13240] Another function of VGAM206 is therefore inhibition of KIAA0620 (Accession XM_030707). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0620. KIAA0748 (Accession NM_014796) is another VGAM206 host target gene. KIAA0748 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0748, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0748 BINDING SITE, designated SEQ ID:16705, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13241] Another function of VGAM206 is therefore inhibition of KIAA0748 (Accession NM_014796). Accordingly, utilities

of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0748. KIAA0763 (Accession NM_014869) is another VGAM206 host target gene. KIAA0763 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0763 BINDING SITE, designated SEQ ID:16971, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13242] Another function of VGAM206 is therefore inhibition of KIAA0763 (Accession NM_014869). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0763. KIAA0836 (Accession XM_035390) is another VGAM206 host target gene. KIAA0836 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0836, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0836 BINDING SITE, designated SEQ ID:32251, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13243] Another function of VGAM206 is therefore inhibition of KIAA0836 (Accession XM_035390). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0836. KIAA0930 (Accession XM_047214) is another VGAM206 host target gene. KIAA0930 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0930 BINDING SITE, designated SEQ ID:34919, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13244] Another function of VGAM206 is therefore inhibition of KIAA0930 (Accession XM_047214). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0930. KIAA1026 (Accession XM_048825) is another VGAM206 host target gene. KIAA1026 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1026 BINDING SITE, designated SEQ ID:35279, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13245] Another function of VGAM206 is therefore inhibition of KIAA1026 (Accession XM_048825). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1026. KIAA1056 (Accession NM_014894) is another VGAM206 host target gene. KIAA1056 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1056 BINDING SITE, designated SEQ ID:17051, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13246] Another function of VGAM206 is therefore inhibition of

KIAA1056 (Accession NM_014894). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1056. KIAA1078 (Accession XM_036589) is another VGAM206 host target gene. KIAA1078 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1078 BINDING SITE, designated SEQ ID:32475, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13247] Another function of VGAM206 is therefore inhibition of KIAA1078 (Accession XM_036589). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1078. KIAA1171 (Accession XM_113868) is another VGAM206 host target gene. KIAA1171 BINDING SITE1 and KIAA1171 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1171, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1171 BINDING SITE1 and KIAA1171 BINDING SITE2, designated SEQ ID:42484 and SEQ ID:42483 respectively, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13248] Another function of VGAM206 is therefore inhibition of KIAA1171 (Accession XM_113868). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1171. KIAA1297 (Accession XM_051005) is another VGAM206 host target gene. KIAA1297 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1297 BINDING SITE, designated SEQ ID:35719, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13249] Another function of VGAM206 is therefore inhibition of KIAA1297 (Accession XM_051005). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1297. KIAA1354 (Accession XM_027604) is another VGAM206 host target gene. KIAA1354 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1354, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1354 BINDING SITE, designated SEQ ID:30542, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13250] Another function of VGAM206 is therefore inhibition of KIAA1354 (Accession XM_027604). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1354. KIAA1391 (Accession XM_040866) is another VGAM206 host target gene. KIAA1391 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1391 BINDING SITE, designated SEQ ID:33403, to the

nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13251] Another function of VGAM206 is therefore inhibition of KIAA1391 (Accession XM_040866). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1391. KIAA1571 (Accession XM_027744) is another VGAM206 host target gene. KIAA1571 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1571, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1571 BINDING SITE, designated SEQ ID:30568, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13252] Another function of VGAM206 is therefore inhibition of KIAA1571 (Accession XM_027744). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1571. KIAA1753 (Accession XM_036115) is another VGAM206 host target gene. KIAA1753 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1753 BINDING SITE, designated SEQ ID:32382, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13253] Another function of VGAM206 is therefore inhibition of KIAA1753 (Accession XM_036115). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1753. KIAA1855 (Accession XM_166453) is another VGAM206 host target gene. KIAA1855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1855 BINDING SITE, designated SEQ ID:44362, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13254] Another function of VGAM206 is therefore inhibition of KIAA1855 (Accession XM_166453). Accordingly, utilities

of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1855. KIAA1872 (Accession XM_031917) is another VGAM206 host target gene. KIAA1872 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1872, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1872 BINDING SITE, designated SEQ ID:31523, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13255] Another function of VGAM206 is therefore inhibition of KIAA1872 (Accession XM_031917). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1872. I(3)mbt-like 2 (Drosophila) (L3MBTL2, Accession XM_114201) is another VGAM206 host target gene. L3MBTL2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by L3MBTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of L3MBTL2 BINDING SITE, designated SEQ ID:42794, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13256] Another function of VGAM206 is therefore inhibition of l(3)mbt-like 2 (Drosophila) (L3MBTL2, Accession XM_114201). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with L3MBTL2. LEC3 (Accession NM_015236) is another VGAM206 host target gene. LEC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LEC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEC3 BINDING SITE, designated SEQ ID:17573, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13257] Another function of VGAM206 is therefore inhibition of LEC3 (Accession NM_015236). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEC3. LIN-7-C (Accession NM_018362) is another VGAM206

host target gene. LIN-7-C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIN-7-C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIN-7-C BINDING SITE, designated SEQ ID:20370, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13258] Another function of VGAM206 is therefore inhibition of LIN-7-C (Accession NM_018362). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIN-7-C. Lipase, Member I (LIPI, Accession XM_086767) is another VGAM206 host target gene. LIPI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIPI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIPI BINDING SITE, designated SEQ ID:38844, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13259] Another function of VGAM206 is therefore inhibition of Lipase, Member I (LIPI, Accession XM_086767). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIPI. MGC10715 (Accession NM_024325) is another VGAM206 host target gene. MGC10715 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC10715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10715 BINDING SITE, designated SEQ ID:23618, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13260] Another function of VGAM206 is therefore inhibition of MGC10715 (Accession NM_024325). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10715. MGC20576 (Accession NM_144691) is another VGAM206 host target gene. MGC20576 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC20576, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20576 BINDING SITE, designated SEQ ID:29511, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13261] Another function of VGAM206 is therefore inhibition of MGC20576 (Accession NM_144691). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20576. MGC3123 (Accession NM_024107) is another VGAM206 host target gene. MGC3123 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3123 BINDING SITE, designated SEQ ID:23552, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13262] Another function of VGAM206 is therefore inhibition of MGC3123 (Accession NM_024107). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC3123. MGC5302 (Accession NM_024089) is another VGAM206 host target gene. MGC5302 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC5302, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5302 BINDING SITE, designated SEQ ID:23531, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13263] Another function of VGAM206 is therefore inhibition of MGC5302 (Accession NM_024089). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5302. MGC9753 (Accession NM_033419) is another VGAM206 host target gene. MGC9753 BINDING SITE1 and MGC9753 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MGC9753, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC9753 BINDING SITE1 and MGC9753 BINDING SITE2, designated SEQ ID:27245 and SEQ ID:27239 respectively, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13264] Another function of VGAM206 is therefore inhibition of MGC9753 (Accession NM_033419). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC9753. MPPE1 (Accession NM_023075) is another VGAM206 host target gene. MPPE1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region

of mRNA encoded by MPPE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPPE1 BINDING SITE, designated SEQ ID:23333, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13265] Another function of VGAM206 is therefore inhibition of MPPE1 (Accession NM_023075). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPPE1. p21(CDKN1A)-activated Kinase 7 (PAK7, Accession XM_045653) is another VGAM206 host target gene. PAK7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAK7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAK7 BINDING SITE, designated SEQ ID:34511, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13266] Another function of VGAM206 is therefore inhibition of p21(CDKN1A)-activated Kinase 7 (PAK7, Accession

XM_045653). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK7. Phospholipid Scramblase 3 (PLSCR3, Accession XM_165421) is another VGAM206 host target gene. PLSCR3 BINDING SITE1 and PLSCR3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PLSCR3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLSCR3 BINDING SITE1 and PLSCR3 BINDING SITE2, designated SEQ ID:43638 and SEQ ID:21633 respectively, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13267] Another function of VGAM206 is therefore inhibition of Phospholipid Scramblase 3 (PLSCR3, Accession XM_165421). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLSCR3. PRO1430 (Accession NM_018599) is another VGAM206 host target gene. PRO1430 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded

by PRO1430, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1430 BINDING SITE, designated SEQ ID:20676, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13268] Another function of VGAM206 is therefore inhibition of PRO1430 (Accession NM_018599). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1430. RAB3D, Member RAS Oncogene Family (RAB3D, Accession NM_004283) is another VGAM206 host target gene. RAB3D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB3D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB3D BINDING SITE, designated SEQ ID:10494, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13269] Another function of VGAM206 is therefore inhibition of

RAB3D, Member RAS Oncogene Family (RAB3D, Accession NM_004283). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB3D. RABEX5 (Accession NM_014504) is another VGAM206 host target gene.

RABEX5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RABEX5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RABEX5 BINDING SITE, designated SEQ ID:15838, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13270] Another function of VGAM206 is therefore inhibition of RABEX5 (Accession NM_014504). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RABEX5. Regulator of G-protein Signalling 11 (RGS11, Accession NM_003834) is another VGAM206 host target gene. RGS11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RGS11, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS11 BINDING SITE, designated SEQ ID:9926, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13271] Another function of VGAM206 is therefore inhibition of Regulator of G-protein Signalling 11 (RGS11, Accession NM_003834). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS11. RNAHP (Accession NM_007372) is another VGAM206 host target gene. RNAHP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNAHP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNAHP BINDING SITE, designated SEQ ID:14301, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13272] Another function of VGAM206 is therefore inhibition of RNAHP (Accession NM_007372). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with RNAHP. RoXaN (Accession NM_025013) is another VGAM206 host target gene. RoXaN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RoXaN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RoXaN BINDING SITE, designated SEQ ID:24606, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13273] Another function of VGAM206 is therefore inhibition of RoXaN (Accession NM_025013). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RoXaN. Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 4 (RPS6KA4, Accession NM_003942) is another VGAM206 host target gene. RPS6KA4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RPS6KA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPS6KA4 BINDING SITE,

designated SEQ ID:10057, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13274] Another function of VGAM206 is therefore inhibition of Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 4 (RPS6KA4, Accession NM_003942). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPS6KA4. Syndecan Binding Protein (syntenin) (SDCBP, Accession NM_005625) is another VGAM206 host target gene. SDCBP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDCBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDCBP BINDING SITE, designated SEQ ID:12137, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13275] Another function of VGAM206 is therefore inhibition of Syndecan Binding Protein (syntenin) (SDCBP, Accession NM_005625). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with SDCBP. SEC24 Related Gene Family, Member D (*S. cerevisiae*) (SEC24D, Accession NM_014822) is another VGAM206 host target gene. SEC24D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEC24D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC24D BINDING SITE, designated SEQ ID:16801, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13276] Another function of VGAM206 is therefore inhibition of SEC24 Related Gene Family, Member D (*S. cerevisiae*) (SEC24D, Accession NM_014822). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC24D. Septin 3 (SEPT3, Accession NM_019106) is another VGAM206 host target gene. SEPT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEPT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of SEPT3 BINDING SITE, designated SEQ ID:21186, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13277] Another function of VGAM206 is therefore inhibition of Septin 3 (SEPT3, Accession NM_019106). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEPT3. SHC3 (Accession NM_016848) is another VGAM206 host target gene. SHC3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SHC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SHC3 BINDING SITE, designated SEQ ID:18843, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13278] Another function of VGAM206 is therefore inhibition of SHC3 (Accession NM_016848). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHC3. Solute Carrier Family 37 (glycerol-3-phosphate transporter),

Member 1 (SLC37A1, Accession NM_018964) is another VGAM206 host target gene. SLC37A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC37A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC37A1 BINDING SITE, designated SEQ ID:21035, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13279] Another function of VGAM206 is therefore inhibition of Solute Carrier Family 37 (glycerol-3-phosphate transporter), Member 1 (SLC37A1, Accession NM_018964). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC37A1. SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily F, Member 1 (SMARCF1, Accession NM_018450) is another VGAM206 host target gene. SMARCF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMARCF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of SMARCF1 BINDING SITE, designated SEQ ID:20523, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13280] Another function of VGAM206 is therefore inhibition of SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily F, Member 1 (SMARCF1, Accession NM_018450). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCF1. SR-BP1 (Accession NM_005866) is another VGAM206 host target gene. SR-BP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SR-BP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SR-BP1 BINDING SITE, designated SEQ ID:12487, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13281] Another function of VGAM206 is therefore inhibition of SR-BP1 (Accession NM_005866). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with SR-BP1. Suppression of Tumorigenicity 7 Like (ST7L, Accession NM_139195) is another VGAM206 host target gene. ST7L BINDING SITE1 and ST7L BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ST7L, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ST7L BINDING SITE1 and ST7L BINDING SITE2, designated SEQ ID:29204 and SEQ ID:29209 respectively, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13282] Another function of VGAM206 is therefore inhibition of Suppression of Tumorigenicity 7 Like (ST7L, Accession NM_139195). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST7L. T-cell Leukemia/lymphoma 6 (TCL6, Accession NM_012468) is another VGAM206 host target gene. TCL6 BINDING SITE1 and TCL6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TCL6, corresponding to HOST TARGET binding sites such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCL6 BINDING SITE1 and TCL6 BINDING SITE2, designated SEQ ID:14848 and SEQ ID:20797 respectively, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13283] Another function of VGAM206 is therefore inhibition of T-cell Leukemia/lymphoma 6 (TCL6, Accession NM_012468). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCL6. TUSP (Accession NM_020245) is another VGAM206 host target gene. TUSP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TUSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUSP BINDING SITE, designated SEQ ID:21534, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13284] Another function of VGAM206 is therefore inhibition of TUSP (Accession NM_020245). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with TUSP.

LOC123242 (Accession XM_063548) is another VGAM206 host target gene. LOC123242 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC123242, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123242 BINDING SITE, designated SEQ ID:37248, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13285] Another function of VGAM206 is therefore inhibition of LOC123242 (Accession XM_063548). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123242. LOC134637 (Accession XM_059727) is another VGAM206 host target gene. LOC134637 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC134637, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC134637 BINDING SITE, designated SEQ ID:37080, to

the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13286] Another function of VGAM206 is therefore inhibition of LOC134637 (Accession XM_059727). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134637. LOC135398 (Accession XM_069333) is another VGAM206 host target gene. LOC135398 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC135398, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135398 BINDING SITE, designated SEQ ID:37389, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13287] Another function of VGAM206 is therefore inhibition of LOC135398 (Accession XM_069333). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135398. LOC143308 (Accession XM_096411) is another VGAM206 host target gene. LOC143308 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC143308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143308 BINDING SITE, designated SEQ ID:40350, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13288] Another function of VGAM206 is therefore inhibition of LOC143308 (Accession XM_096411). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143308. LOC144742 (Accession XM_084949) is another VGAM206 host target gene. LOC144742 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144742, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144742 BINDING SITE, designated SEQ ID:37780, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13289] Another function of VGAM206 is therefore inhibition of LOC144742 (Accession XM_084949). Accordingly, utilities

of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144742. LOC145945 (Accession XM_096908) is another VGAM206 host target gene. LOC145945 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145945 BINDING SITE, designated SEQ ID:40640, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13290] Another function of VGAM206 is therefore inhibition of LOC145945 (Accession XM_096908). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145945. LOC147632 (Accession NM_138478) is another VGAM206 host target gene. LOC147632 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147632, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC147632 BINDING SITE, designated SEQ ID:28829, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13291] Another function of VGAM206 is therefore inhibition of LOC147632 (Accession NM_138478). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147632. LOC147669 (Accession XM_097262) is another VGAM206 host target gene. LOC147669 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147669 BINDING SITE, designated SEQ ID:40855, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13292] Another function of VGAM206 is therefore inhibition of LOC147669 (Accession XM_097262). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147669. LOC149157 (Accession XM_086442) is another VGAM206 host target gene. LOC149157 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149157 BINDING SITE, designated SEQ ID:38658, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13293] Another function of VGAM206 is therefore inhibition of LOC149157 (Accession XM_086442). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149157. LOC149373 (Accession XM_086507) is another VGAM206 host target gene. LOC149373 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149373 BINDING SITE, designated SEQ ID:38721, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13294] Another function of VGAM206 is therefore inhibition of

LOC149373 (Accession XM_086507). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149373. LOC149935 (Accession XM_015885) is another VGAM206 host target gene. LOC149935 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149935, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149935 BINDING SITE, designated SEQ ID:30248, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13295] Another function of VGAM206 is therefore inhibition of LOC149935 (Accession XM_015885). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149935. LOC150157 (Accession XM_097823) is another VGAM206 host target gene. LOC150157 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC150157 BINDING SITE, designated SEQ ID:41145, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13296] Another function of VGAM206 is therefore inhibition of LOC150157 (Accession XM_097823). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150157. LOC150271 (Accession XM_097859) is another VGAM206 host target gene. LOC150271 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150271 BINDING SITE, designated SEQ ID:41174, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13297] Another function of VGAM206 is therefore inhibition of LOC150271 (Accession XM_097859). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150271. LOC150279 (Accession XM_086820) is an-

other VGAM206 host target gene. LOC150279 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150279, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150279 BINDING SITE, designated SEQ ID:38902, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13298] Another function of VGAM206 is therefore inhibition of LOC150279 (Accession XM_086820). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150279. LOC150407 (Accession XM_086906) is another VGAM206 host target gene. LOC150407 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150407, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150407 BINDING SITE, designated SEQ ID:38955, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13299] Another function of VGAM206 is therefore inhibition of LOC150407 (Accession XM_086906). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150407. LOC152447 (Accession XM_087471) is another VGAM206 host target gene. LOC152447 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152447, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152447 BINDING SITE, designated SEQ ID:39274, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13300] Another function of VGAM206 is therefore inhibition of LOC152447 (Accession XM_087471). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152447. LOC153163 (Accession XM_087612) is another VGAM206 host target gene. LOC153163 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153163, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153163 BINDING SITE, designated SEQ ID:39361, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13301] Another function of VGAM206 is therefore inhibition of LOC153163 (Accession XM_087612). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153163. LOC158062 (Accession XM_098861) is another VGAM206 host target gene. LOC158062 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158062, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158062 BINDING SITE, designated SEQ ID:41915, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13302] Another function of VGAM206 is therefore inhibition of LOC158062 (Accession XM_098861). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC158062. LOC158292 (Accession XM_098914) is another VGAM206 host target gene. LOC158292 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158292, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158292 BINDING SITE, designated SEQ ID:41933, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13303] Another function of VGAM206 is therefore inhibition of LOC158292 (Accession XM_098914). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158292. LOC196283 (Accession XM_113684) is another VGAM206 host target gene. LOC196283 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196283 BINDING SITE, designated SEQ ID:42343, to the nucleotide sequence of VGAM206 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2917.

[13304] Another function of VGAM206 is therefore inhibition of LOC196283 (Accession XM_113684). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196283. LOC196812 (Accession XM_116868) is another VGAM206 host target gene. LOC196812 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196812, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196812 BINDING SITE, designated SEQ ID:43141, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13305] Another function of VGAM206 is therefore inhibition of LOC196812 (Accession XM_116868). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196812. LOC196890 (Accession XM_116951) is another VGAM206 host target gene. LOC196890 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196890, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196890 BINDING SITE, designated SEQ ID:43156, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13306] Another function of VGAM206 is therefore inhibition of LOC196890 (Accession XM_116951). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196890. LOC200035 (Accession XM_055305) is another VGAM206 host target gene. LOC200035 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200035, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200035 BINDING SITE, designated SEQ ID:36264, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13307] Another function of VGAM206 is therefore inhibition of LOC200035 (Accession XM_055305). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC200035. LOC201229 (Accession XM_113925) is another VGAM206 host target gene. LOC201229 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201229 BINDING SITE, designated SEQ ID:42546, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13308] Another function of VGAM206 is therefore inhibition of LOC201229 (Accession XM_113925). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201229. LOC201252 (Accession XM_113941) is another VGAM206 host target gene. LOC201252 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201252, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201252 BINDING SITE, designated SEQ ID:42557, to

the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13309] Another function of VGAM206 is therefore inhibition of LOC201252 (Accession XM_113941). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201252. LOC204285 (Accession XM_115292) is another VGAM206 host target gene. LOC204285 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC204285, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204285 BINDING SITE, designated SEQ ID:43091, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13310] Another function of VGAM206 is therefore inhibition of LOC204285 (Accession XM_115292). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204285. LOC204970 (Accession XM_114795) is another VGAM206 host target gene. LOC204970 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC204970, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204970 BINDING SITE, designated SEQ ID:43074, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13311] Another function of VGAM206 is therefore inhibition of LOC204970 (Accession XM_114795). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204970. LOC219654 (Accession XM_166095) is another VGAM206 host target gene. LOC219654 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219654, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219654 BINDING SITE, designated SEQ ID:43873, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13312] Another function of VGAM206 is therefore inhibition of LOC219654 (Accession XM_166095). Accordingly, utilities

of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219654. LOC220064 (Accession XM_167827) is another VGAM206 host target gene. LOC220064 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220064, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220064 BINDING SITE, designated SEQ ID:44871, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13313] Another function of VGAM206 is therefore inhibition of LOC220064 (Accession XM_167827). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220064. LOC221025 (Accession XM_167644) is another VGAM206 host target gene. LOC221025 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221025, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC221025 BINDING SITE, designated SEQ ID:44747, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13314] Another function of VGAM206 is therefore inhibition of LOC221025 (Accession XM_167644). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221025. LOC221794 (Accession XM_168214) is another VGAM206 host target gene. LOC221794 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221794 BINDING SITE, designated SEQ ID:45072, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13315] Another function of VGAM206 is therefore inhibition of LOC221794 (Accession XM_168214). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221794. LOC222256 (Accession XM_168571) is another VGAM206 host target gene. LOC222256 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222256, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222256 BINDING SITE, designated SEQ ID:45251, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13316] Another function of VGAM206 is therefore inhibition of LOC222256 (Accession XM_168571). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222256. LOC222614 (Accession XM_169970) is another VGAM206 host target gene. LOC222614 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222614, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222614 BINDING SITE, designated SEQ ID:45307, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13317] Another function of VGAM206 is therefore inhibition of

LOC222614 (Accession XM_169970). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222614. LOC222962 (Accession XM_167291) is another VGAM206 host target gene. LOC222962 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222962, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222962 BINDING SITE, designated SEQ ID:44632, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13318] Another function of VGAM206 is therefore inhibition of LOC222962 (Accession XM_167291). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222962. LOC253001 (Accession XM_171711) is another VGAM206 host target gene. LOC253001 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC253001 BINDING SITE, designated SEQ ID:46062, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13319] Another function of VGAM206 is therefore inhibition of LOC253001 (Accession XM_171711). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253001. LOC253639 (Accession XM_171060) is another VGAM206 host target gene. LOC253639 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253639, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253639 BINDING SITE, designated SEQ ID:45857, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13320] Another function of VGAM206 is therefore inhibition of LOC253639 (Accession XM_171060). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253639. LOC254381 (Accession XM_173436) is an-

other VGAM206 host target gene. LOC254381 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254381, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254381 BINDING SITE, designated SEQ ID:46545, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13321] Another function of VGAM206 is therefore inhibition of LOC254381 (Accession XM_173436). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254381. LOC254423 (Accession XM_173286) is another VGAM206 host target gene. LOC254423 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254423 BINDING SITE, designated SEQ ID:46532, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13322] Another function of VGAM206 is therefore inhibition of LOC254423 (Accession XM_173286). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254423. LOC255452 (Accession XM_174088) is another VGAM206 host target gene. LOC255452 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255452, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255452 BINDING SITE, designated SEQ ID:46578, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13323] Another function of VGAM206 is therefore inhibition of LOC255452 (Accession XM_174088). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255452. LOC256520 (Accession XM_171126) is another VGAM206 host target gene. LOC256520 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256520, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256520 BINDING SITE, designated SEQ ID:45929, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13324] Another function of VGAM206 is therefore inhibition of LOC256520 (Accession XM_171126). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256520. LOC257104 (Accession XM_173830) is another VGAM206 host target gene. LOC257104 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257104, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257104 BINDING SITE, designated SEQ ID:46564, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13325] Another function of VGAM206 is therefore inhibition of LOC257104 (Accession XM_173830). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC257104. LOC257282 (Accession XM_172844) is another VGAM206 host target gene. LOC257282 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257282, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257282 BINDING SITE, designated SEQ ID:46122, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13326] Another function of VGAM206 is therefore inhibition of LOC257282 (Accession XM_172844). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257282. LOC91409 (Accession XM_038298) is another VGAM206 host target gene. LOC91409 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91409, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91409 BINDING SITE, designated SEQ ID:32806, to the nucleotide sequence of VGAM206 RNA, herein designated

VGAM RNA, also designated SEQ ID:2917.

[13327] Another function of VGAM206 is therefore inhibition of LOC91409 (Accession XM_038298). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91409. LOC91828 (Accession XM_040910) is another VGAM206 host target gene. LOC91828 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91828, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91828 BINDING SITE, designated SEQ ID:33410, to the nucleotide sequence of VGAM206 RNA, herein designated VGAM RNA, also designated SEQ ID:2917.

[13328] Another function of VGAM206 is therefore inhibition of LOC91828 (Accession XM_040910). Accordingly, utilities of VGAM206 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91828. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 207 (VGAM207) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13329] VGAM207 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM207 was detected is described hereinabove with reference to Figs. 1–8.

[13330] VGAM207 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM207 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13331] VGAM207 gene encodes a VGAM207 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM207 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM207 precursor RNA is designated SEQ ID:193, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:193 is located at position 203744 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[13332] VGAM207 precursor RNA folds onto itself, forming VGAM207 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13333] An enzyme complex designated DICER COMPLEX, `dices` the VGAM207 folded precursor RNA into VGAM207 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM207 RNA is designated SEQ ID:2918, and is provided hereinbelow with reference to the sequence listing part.

[13334] VGAM207 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM207 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM207 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13335] VGAM207 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM207 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM207 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM207 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM207 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13336] The complementary binding of VGAM207 RNA, herein designated VGAM RNA, to host target binding sites on VGAM207 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM207 host target RNA into VGAM207 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13337] It is appreciated that VGAM207 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM207 host target genes. The mRNA of each one of this plurality of VGAM207 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM207 RNA, herein designated VGAM RNA, and which when bound by VGAM207 RNA causes inhibition of translation of respective one or more VGAM207 host target proteins.

[13338] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM207 gene, herein designated VGAM GENE, on one or more VGAM207 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[13339] It is yet further appreciated that a function of VGAM207 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM207 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM207 correlate

with, and may be deduced from, the identity of the host target genes which VGAM207 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13340] Nucleotide sequences of the VGAM207 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM207 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM207 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM207 are further described hereinbelow with reference to Table 1.

[13341] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM207 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM207 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13342] As mentioned hereinabove with reference to Fig. 1, a function of VGAM207 gene, herein designated VGAM is inhibition of expression of VGAM207 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM207 correlate with, and may be deduced

from, the identity of the target genes which VGAM207 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13343] Optic Atrophy 3 (autosomal recessive, with chorea and spastic paraplegia) (OPA3, Accession NM_025136) is a VGAM207 host target gene. OPA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OPA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPA3 BINDING SITE, designated SEQ ID:24776, to the nucleotide sequence of VGAM207 RNA, herein designated VGAM RNA, also designated SEQ ID:2918.

[13344] A function of VGAM207 is therefore inhibition of Optic Atrophy 3 (autosomal recessive, with chorea and spastic paraplegia) (OPA3, Accession NM_025136). Accordingly, utilities of VGAM207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPA3. LOC159184 (Accession XM_010658) is another VGAM207 host target gene. LOC159184 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC159184, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159184 BINDING SITE, designated SEQ ID:30162, to the nucleotide sequence of VGAM207 RNA, herein designated VGAM RNA, also designated SEQ ID:2918.

[13345] Another function of VGAM207 is therefore inhibition of LOC159184 (Accession XM_010658). Accordingly, utilities of VGAM207 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159184. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 208 (VGAM208) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13346] VGAM208 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM208 was detected is described hereinabove with reference to Figs. 1–8.

[13347] VGAM208 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syn–

drome Virus (white spot bacilliform virus). VGAM208 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13348] VGAM208 gene encodes a VGAM208 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM208 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM208 precursor RNA is designated SEQ ID:194, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:194 is located at position 15808 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[13349] VGAM208 precursor RNA folds onto itself, forming VGAM208 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13350] An enzyme complex designated DICER COMPLEX, `dices` the VGAM208 folded precursor RNA into VGAM208 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM208 RNA is designated SEQ ID:2919, and is provided hereinbelow with reference to the sequence listing part.

[13351] VGAM208 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM208 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM208 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13352] VGAM208 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM208 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM208 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM208 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM208 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13353] The complementary binding of VGAM208 RNA, herein designated VGAM RNA, to host target binding sites on VGAM208 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM208 host tar-

get RNA into VGAM208 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13354] It is appreciated that VGAM208 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM208 host target genes. The mRNA of each one of this plurality of VGAM208 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM208 RNA, herein designated VGAM RNA, and which when bound by VGAM208 RNA causes inhibition of translation of respective one or more VGAM208 host target proteins.

[13355] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM208 gene, herein designated VGAM GENE, on one or more VGAM208 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[13356] It is yet further appreciated that a function of VGAM208 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM208 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM208 correlate with, and may be deduced from, the identity of the host target genes which VGAM208 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13357] Nucleotide sequences of the VGAM208 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM208 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM208 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM208 are further described hereinbelow with reference to Table 1.

[13358] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM208 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM208 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13359] As mentioned hereinabove with reference to Fig. 1, a function of VGAM208 gene, herein designated VGAM is inhibition of expression of VGAM208 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM208 correlate with, and may be deduced from, the identity of the target genes which VGAM208 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13360] Activin A Receptor, Type IB (ACVR1B, Accession NM_004302) is a VGAM208 host target gene. ACVR1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACVR1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of ACVR1B BINDING SITE, designated SEQ ID:10511, to the nucleotide sequence of VGAM208 RNA, herein designated VGAM RNA, also designated SEQ ID:2919.

[13361] A function of VGAM208 is therefore inhibition of Activin A Receptor, Type IB (ACVR1B, Accession NM_004302), a gene which Activin receptor-like kinase; similar to activin, TGF-beta, and C. elegans daf-1 receptors. Accordingly, utilities of VGAM208 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACVR1B. The function of ACVR1B has been established by previous studies. See ACVRL1 (OMIM Ref. No. 601284). Human cDNA clones encoding 4 putative trans-membrane ser/thr kinases were identified by ten Dijke et al. (1993). Using degenerate DNA primers based on the human activin receptor type II (see OMIM Ref. No. 102581) and C. elegans Daf-1 gene products, they PCR-amplified mRNA from human erythroleukemia (HEL) cells, a cell type known to respond both to activin (OMIM Ref. No. 147290) and TGF-beta (OMIM Ref. No. 190180). Their partial clone of the ALK4 gene encodes a 383-amino acid polypeptide with a truncated extracellular domain but sequence and

structural domain similarities with the other 3 ALK genes they cloned. ALK1, ALK2 (OMIM Ref. No. 102576), ALK3 (OMIM Ref. No. 601299), and ALK4 share approximately 40% sequence identity with activin receptors type II and IIB, TGF-beta receptor (see OMIM Ref. No. 190181), and Daf-1 in their kinase domains but share 60 to 79% sequence identity among themselves, suggesting to ten Dijke et al. (1993) that the ALK gene products form a subfamily of receptor ser/thr kinases. By Northern analysis, ten Dijke et al. (1993) showed that ALK4 is expressed in many tissues, most strongly in human kidney, pancreas, brain, lung, and liver. Su et al. (2001) described the gene structure and novel somatic mutations of the activin type IB receptor in pancreatic cancer. This was the first description of ACVR1B as a tumor suppressor gene.

[13362] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13363] ten Dijke, P.; Ichijo, H.; Franzen, P.; Schulz, P.; Saras, J.; Toyoshima, H.; Heldin, C.-H.; Miyazono, K. : Activin receptor-like kinases: a novel subclass of cell-surface receptors with predicted serine/threonine kinase activity. *Oncogene* 8: 2879-2887, 1993. ; and

[13364] Su, G. H.; Bansal, R.; Murphy, K. M.; Montgomery, E.; Yeo, C. J.; Hruban, R. H.; Kern, S. E. : ACVR1B (ALK4, activin receptor type 1B) gene mutations in pancreatic carcinoma. Proc. Nat.

[13365] Further studies establishing the function and utilities of ACVR1B are found in John Hopkins OMIM database record ID 601300, and in cited publications numbered 6501, 650 and 6503–6504 listed in the bibliography section herein–below, which are also hereby incorporated by reference. Kinesin Family Member 3C (KIF3C, Accession NM_002254) is another VGAM208 host target gene. KIF3C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIF3C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIF3C BINDING SITE, designated SEQ ID:8056, to the nucleotide sequence of VGAM208 RNA, herein designated VGAM RNA, also designated SEQ ID:2919.

[13366] Another function of VGAM208 is therefore inhibition of Kinesin Family Member 3C (KIF3C, Accession NM_002254). Accordingly, utilities of VGAM208 include diagnosis, prevention and treatment of diseases and clini–

cal conditions associated with KIF3C. Adaptor-related Protein Complex 3, Sigma 2 Subunit (AP3S2, Accession NM_005829) is another VGAM208 host target gene. AP3S2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AP3S2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP3S2 BINDING SITE, designated SEQ ID:12438, to the nucleotide sequence of VGAM208 RNA, herein designated VGAM RNA, also designated SEQ ID:2919.

[13367] Another function of VGAM208 is therefore inhibition of Adaptor-related Protein Complex 3, Sigma 2 Subunit (AP3S2, Accession NM_005829). Accordingly, utilities of VGAM208 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP3S2. DRIL2 (Accession NM_006465) is another VGAM208 host target gene. DRIL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DRIL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DRIL2 BINDING SITE, designated SEQ

ID:13183, to the nucleotide sequence of VGAM208 RNA, herein designated VGAM RNA, also designated SEQ ID:2919.

[13368] Another function of VGAM208 is therefore inhibition of DRIL2 (Accession NM_006465). Accordingly, utilities of VGAM208 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRIL2. FLJ23311 (Accession NM_024680) is another VGAM208 host target gene. FLJ23311 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ23311, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23311 BINDING SITE, designated SEQ ID:23992, to the nucleotide sequence of VGAM208 RNA, herein designated VGAM RNA, also designated SEQ ID:2919.

[13369] Another function of VGAM208 is therefore inhibition of FLJ23311 (Accession NM_024680). Accordingly, utilities of VGAM208 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23311. KIAA0193 (Accession NM_014766) is another VGAM208 host target gene. KIAA0193 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by KIAA0193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0193 BINDING SITE, designated SEQ ID:16539, to the nucleotide sequence of VGAM208 RNA, herein designated VGAM RNA, also designated SEQ ID:2919.

[13370] Another function of VGAM208 is therefore inhibition of KIAA0193 (Accession NM_014766). Accordingly, utilities of VGAM208 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0193. MGC4172 (Accession NM_024308) is another VGAM208 host target gene. MGC4172 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4172, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4172 BINDING SITE, designated SEQ ID:23601, to the nucleotide sequence of VGAM208 RNA, herein designated VGAM RNA, also designated SEQ ID:2919.

[13371] Another function of VGAM208 is therefore inhibition of

MGC4172 (Accession NM_024308). Accordingly, utilities of VGAM208 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4172. LOC112609 (Accession XM_053013) is another VGAM208 host target gene. LOC112609 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC112609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112609 BINDING SITE, designated SEQ ID:36058, to the nucleotide sequence of VGAM208 RNA, herein designated VGAM RNA, also designated SEQ ID:2919.

[13372] Another function of VGAM208 is therefore inhibition of LOC112609 (Accession XM_053013). Accordingly, utilities of VGAM208 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112609. LOC196484 (Accession XM_031807) is another VGAM208 host target gene. LOC196484 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196484, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC196484 BINDING SITE, designated SEQ ID:31485, to the nucleotide sequence of VGAM208 RNA, herein designated VGAM RNA, also designated SEQ ID:2919.

[13373] Another function of VGAM208 is therefore inhibition of LOC196484 (Accession XM_031807). Accordingly, utilities of VGAM208 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196484. LOC220073 (Accession XM_167847) is another VGAM208 host target gene. LOC220073 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220073 BINDING SITE, designated SEQ ID:44873, to the nucleotide sequence of VGAM208 RNA, herein designated VGAM RNA, also designated SEQ ID:2919.

[13374] Another function of VGAM208 is therefore inhibition of LOC220073 (Accession XM_167847). Accordingly, utilities of VGAM208 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220073. LOC91069 (Accession XM_035824) is an-

other VGAM208 host target gene. LOC91069 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91069, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91069 BINDING SITE, designated SEQ ID:32345, to the nucleotide sequence of VGAM208 RNA, herein designated VGAM RNA, also designated SEQ ID:2919.

[13375] Another function of VGAM208 is therefore inhibition of LOC91069 (Accession XM_035824). Accordingly, utilities of VGAM208 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91069. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 209 (VGAM209) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13376] VGAM209 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM209 was detected is described

hereinabove with reference to Figs. 1–8.

[13377] VGAM209 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM209 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13378] VGAM209 gene encodes a VGAM209 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM209 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM209 precursor RNA is designated SEQ ID:195, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:195 is located at position 72618 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[13379] VGAM209 precursor RNA folds onto itself, forming VGAM209 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13380] An enzyme complex designated DICER COMPLEX, `dices` the VGAM209 folded precursor RNA into VGAM209 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM209 RNA is designated SEQ ID:2920, and is provided hereinbelow with reference to the sequence listing part.

[13381] VGAM209 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM209 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM209 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13382] VGAM209 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM209 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM209 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM209 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM209 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[13383] The complementary binding of VGAM209 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM209 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM209 host target RNA into VGAM209 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13384] It is appreciated that VGAM209 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM209 host target genes. The mRNA of each one of this plurality of VGAM209 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM209 RNA, herein designated VGAM RNA, and which when bound by VGAM209 RNA causes inhibition of translation of respective one or more VGAM209 host target proteins.

[13385] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM209 gene, herein designated VGAM GENE, on one or more VGAM209 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[13386] It is yet further appreciated that a function of VGAM209 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM209 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM209 correlate with, and may be deduced from, the identity of the host target genes which VGAM209 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13387] Nucleotide sequences of the VGAM209 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM209 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM209 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM209 are further described hereinbelow with reference to Table 1.

[13388] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM209 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM209 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13389] As mentioned hereinabove with reference to Fig. 1, a function of VGAM209 gene, herein designated VGAM is inhibition of expression of VGAM209 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM209 correlate with, and may be deduced from, the identity of the target genes which VGAM209 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13390] Insulin-like Growth Factor 2 Receptor (IGF2R, Accession NM_000876) is a VGAM209 host target gene. IGF2R BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by IGF2R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IGF2R BINDING SITE, designated SEQ ID:6560, to the nucleotide sequence of VGAM209 RNA, herein designated VGAM RNA, also designated SEQ ID:2920.

[13391] A function of VGAM209 is therefore inhibition of Insulin-like Growth Factor 2 Receptor (IGF2R, Accession NM_000876), a gene which transport of phosphorylated lysosomal enzymes from the golgi complex and the cell surface to lysosomes. lysosomal enzymes bearing phosphomannosyl residues bind specifically to mannose-6-phosphate receptors in the golgi apparatus and the resulting receptor-ligand complex is transported to an acidic prelysosomal compartment where the low ph mediates the dissociation of the complex. this receptor also binds insulin growth factor ii. Accordingly, utilities of VGAM209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGF2R. The function of IGF2R has been established by previous studies. The mannose 6-phosphate/insulin-like growth factor II receptor functions in the intracellular trafficking

of lysosomal enzymes, the activation of the potent growth inhibitor, transforming growth factor beta, and the degradation of IGF2, a mitogen often overproduced in tumors. De Souza et al. (1995) demonstrated that 70% of human hepatocellular tumors have loss of heterozygosity (LOH) at the M6P/IGF2R locus at 6q26. In a separate report, De Souza et al. (1995) described a mutation screen that identified point mutations in the remaining allele of 25% of human hepatocellular carcinomas with LOH. One mutation created an alternative splice site within an intron (corresponding to intron 40 in mouse) and resulted in a truncated receptor; 2 others (147280.0001, 147280.0002) gave rise to significant amino acid substitutions. These mutations provided evidence to the authors that the M6P/IGF2R gene functions as a tumor suppressor in human liver carcinogenesis. Souza et al. (1996) reported that the IGF2R gene contains a number of microsatellite repeats within its coding sequence. They demonstrated microsatellite instability in this gene in 12 of 92 gastrointestinal tumors studied which were replication/repair error-positive. Mutations occurred in 6 of the poorly differentiated tumors. They noted an anticorrespondence of IGF2R and TGFBR2 (OMIM Ref. No. 190182)

mutations. Of 31 gastrointestinal lesions studied with IGF2R or TGFBR2 mutations, 90% (28) contained mutations in one or the other, but not both, of these genes. Souza et al. (1996) demonstrated that all but 1 of the mutations occurred within an 8-polydeoxyguanine tract spanning nucleotides 4089–4096 of the IGF2R coding sequence. In 1 case of gastric adenocarcinoma, mutation occurred in a polyCT tract spanning nucleotides 6169–6180. These mutations all comprised 1- or 2-bp deletions or insertions within the microsatellite region, causing frameshifts and premature stop codons downstream. Souza et al. (1996) noted that the TGFBR2 gene is also subject to microsatellite instability within its coding region. They noted further that IGF2R and TGFBR2 genes comprise serial points in the same tumorigenesis pathway, since mutation of either gene alone occurred in 90% of the gastrointestinal tumors that they analyzed. To facilitate genetic analyses of the imprint status of human M6P/IGF2R and loss of heterozygosity at this locus in cancer, Killian et al. (2001) screened American and Japanese populations for M6P/IGF2R single nucleotide polymorphisms (SNPs). They identified 9 novel intragenic SNPs and 3 amino acid variants in the ligand-binding domains of M6P/IGF2R that may be under selec-

tion in humans Animal model experiments lend further support to the function of IGF2R. To determine whether paternal expression of the Igf2r gene is necessary for early development in the mouse, Lau et al. (1994) derived mice in which the gene had been disrupted by targeted mutagenesis in embryonic stem (ES) cells with the subsequent introduction of the mutation into the germline of mice. Lau et al. (1994) found that murine embryos that inherit a nonfunctional Igf2r gene from their father are viable and develop normally into adults; however, most mice inheriting the same mutated allele from their mothers die around the time of birth as a consequence of major cardiac abnormalities. The mice that inherit the mutant allele from their mothers do not express Igf2r in their tissues, are 25 to 30% larger than their normal sibs, have elevated levels of circulating IGF2 and IGF-binding proteins, and exhibit a slight kink in the tail. The findings of overgrowth may support the suggestion that relaxation of maternal imprinting of IGF2 plays a role in the features of Beckwith-Wiedemann syndrome (OMIM Ref. No. 130650) (Feinberg, 1993).

[13392] It is appreciated that the abovementioned animal model for IGF2R is acknowledged by those skilled in the art as a

scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[13393] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13394] Lau, M. M. H.; Stewart, C. E. H.; Liu, Z.; Bhatt, H.; Rotwein, P.; Stewart, C. L. : Loss of the imprinted IGF2/cation-independent mannose 6-phosphate receptor results in fetal overgrowth and perinatal lethality. *Genes Dev.* 8: 2953–2963, 1994. ; and

[13395] Sleutels, F.; Zwart, R.; Barlow, D. P. : The non-coding Air RNA is required for silencing autosomal imprinted genes. *Nature* 415: 810–813, 2002.

[13396] Further studies establishing the function and utilities of IGF2R are found in John Hopkins OMIM database record ID 147280, and in cited publications numbered 4824–4839, 470 and 5228–5240 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Neural Precursor Cell Expressed, Developmentally Down-regulated 4 (NEDD4, Accession XM_046129) is another VGAM209 host target gene. NEDD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEDD4, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEDD4 BINDING SITE, designated SEQ ID:34692, to the nucleotide sequence of VGAM209 RNA, herein designated VGAM RNA, also designated SEQ ID:2920.

[13397] Another function of VGAM209 is therefore inhibition of Neural Precursor Cell Expressed, Developmentally Down-regulated 4 (NEDD4, Accession XM_046129), a gene which ubiquitinates regulatory proteins involved in transcription. Accordingly, utilities of VGAM209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEDD4. The function of NEDD4 has been established by previous studies. Kumar et al. (1992) identified Nedd4 as one of a group of mouse genes that show developmentally regulated expression in mouse embryonic brain. Kumar et al. (1997) showed that Nedd4 is expressed in various other embryonic tissues and persists in most adult tissues. Using antibody raised against a fusion protein, they demonstrated that the Nedd4 protein is localized to the cellular cytoplasm. Kumar et al. (1997) reported that the human NEDD4 protein has 86% amino acid identity with the mouse protein. It has homology to ubiq-

ubiquitin–protein ligases and contains 4 protein–protein interaction (WW) domains and a calcium/phospholipid binding domain. Imhof and McDonnell (1996) found that both human NEDD4 and yeast RSP5 potentiate hormone–dependent activation of transcription by the human progesterone and glucocorticoid receptors. They used mutant proteins to show that neither the ubiquitin–protein ligase activity nor the WW domains are absolutely required for the potentiation of the steroid receptors.

[13398] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13399] Imhof, M. O.; McDonnell, D. P. : Yeast RSP5 and its human homolog hRPF1 potentiate hormone–dependent activation of transcription by human progesterone and glucocorticoid receptors. *Molec. Cell. Biol.* 16: 2594–2605, 1996. ; and

[13400] Kumar, S.; Harvey, K. F.; Kinoshita, M.; Copeland, N. G.; Noda, M.; Jenkins, N. A. : cDNA cloning, expression analysis, and mapping of the mouse Nedd4 gene. *Genomics* 40: 435–443, 1997.

[13401] Further studies establishing the function and utilities of NEDD4 are found in John Hopkins OMIM database record

ID 602278, and in cited publications numbered 7555–280 and 1596 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RAD17 Homolog (*S. pombe*) (RAD17, Accession NM_133340) is another VGAM209 host target gene. RAD17 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RAD17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD17 BINDING SITE, designated SEQ ID:28481, to the nucleotide sequence of VGAM209 RNA, herein designated VGAM RNA, also designated SEQ ID:2920.

[13402] Another function of VGAM209 is therefore inhibition of RAD17 Homolog (*S. pombe*) (RAD17, Accession NM_133340), a gene which may have a role in DNA damage-dependent and DNA replication-dependent cell cycle checkpoints. Accordingly, utilities of VGAM209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD17. The function of RAD17 has been established by previous studies. Cell cycle checkpoints are complex signal transduction pathways that ensure the coordination of the timing and order of

cell cycle events. These checkpoint pathways play critical roles in maintaining genomic stability and integrity to prevent the development of cancer and hereditary diseases. In the fission yeast *Schizosaccharomyces pombe*, the *rad17* gene is required for both the DNA damage-dependent and the DNA replication-dependent cell cycle checkpoints. Parker et al. (1998) identified expressed sequence tags corresponding to a human homolog of *S. pombe rad17*. By PCR, they isolated a human SK-N-MC neuroblastoma cell cDNA containing the complete open reading frame of this homolog, RAD17. The deduced 670-amino acid RAD17 protein has a calculated molecular mass of 71 kD and has 20% sequence identity to *S. pombe rad17*. Northern blot analysis detected an approximately 3.0-kb transcript in all tissues examined, with elevated levels in testis and cancer cell lines. Although human RAD17 did not complement the checkpoint phenotypes of an *S. pombe rad17* mutant, it interacted with human RAD1 (OMIM Ref. No. 603153) in a yeast 2-hybrid system, and Parker et al. (1998) suggested that it is the homolog of *S. pombe rad17*.

[13403] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [13404] Parker, A. E.; Van de Weyer, I.; Laus, M. C.; Verhasselt, P.; Luyten, W. H. M. L. : Identification of a human homologue of the *Schizosaccharomyces pombe* rad17+ checkpoint gene. *J. Biol. Chem.* 273: 18340–18346, 1998. Note: Erratum: *J. Biol. Chem.* 274: 24438–24439, 1999. ; and

- [13406] Further studies establishing the function and utilities of RAD17 are found in John Hopkins OMIM database record ID 603139, and in cited publications numbered 5065, 1010 and 5423–5424 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BC022889 (Accession XM_096964) is another VGAM209 host target gene. BC022889 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BC022889, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BC022889 BINDING SITE, designated SEQ ID:40685, to the

nucleotide sequence of VGAM209 RNA, herein designated VGAM RNA, also designated SEQ ID:2920.

[13407] Another function of VGAM209 is therefore inhibition of BC022889 (Accession XM_096964). Accordingly, utilities of VGAM209 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BC022889. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 210 (VGAM210) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13408] VGAM210 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM210 was detected is described hereinabove with reference to Figs. 1–8.

[13409] VGAM210 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM210 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13410] VGAM210 gene encodes a VGAM210 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM210 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM210 precursor RNA is designated SEQ ID:196, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:196 is located at position 58881 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[13411] VGAM210 precursor RNA folds onto itself, forming VGAM210 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13412] An enzyme complex designated DICER COMPLEX, `dices` the VGAM210 folded precursor RNA into VGAM210 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM210 RNA is designated SEQ ID:2921, and is provided hereinbelow with reference to the sequence listing part.

[13413] VGAM210 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM210 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM210 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13414] VGAM210 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM210 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM210 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM210 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM210 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[13415] The complementary binding of VGAM210 RNA, herein designated VGAM RNA, to host target binding sites on VGAM210 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM210 host target RNA into VGAM210 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13416] It is appreciated that VGAM210 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM210 host target genes. The mRNA of each one of this plurality of VGAM210 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM210 RNA, herein designated VGAM RNA, and which when bound by VGAM210 RNA causes inhibition of translation of respective one or more VGAM210 host target proteins.

[13417] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM210 gene, herein designated VGAM GENE, on one or more VGAM210 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[13418] It is yet further appreciated that a function of VGAM210 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM210 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM210 correlate with, and may be deduced from, the identity of the host target genes which VGAM210 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13419] Nucleotide sequences of the VGAM210 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM210 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM210 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM210 are further described hereinbelow with reference to Table 1.

[13420] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM210 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM210 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13421] As mentioned hereinabove with reference to Fig. 1, a function of VGAM210 gene, herein designated VGAM is inhibition of expression of VGAM210 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM210 correlate with, and may be deduced from, the identity of the target genes which VGAM210 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13422] Cadherin 3, Type 1, P-cadherin (placental) (CDH3, Accession NM_001793) is a VGAM210 host target gene. CDH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH3 BINDING SITE, designated SEQ ID:7545, to the nucleotide sequence of VGAM210 RNA, herein designated VGAM RNA, also designated SEQ ID:2921.

[13423] A function of VGAM210 is therefore inhibition of Cadherin 3, Type 1, P-cadherin (placental) (CDH3, Accession NM_001793), a gene which is a calcium dependent cell adhesion protein. Accordingly, utilities of VGAM210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH3. The function of CDH3 has been established by previous studies. Cadherins are a multigene family of $\text{Ca}(2+)$ -dependent cell adhesion molecules. They are transmembrane glycoproteins consisting of an extracellular domain, a transmembrane region, and a cytoplasmic domain. The extracellular domains mediate $\text{Ca}(2+)$ -dependent intercellular adhesion by homophilic interactions. The binding properties and specificities of the adhesive function are located in the N-terminal part of the molecules. Neural (OMIM Ref. No. 114020), placental (OMIM Ref. No. 114021), and epithelial (also called uvomorulin; 192090) forms of cadherin have been characterized. Donalies et al. (1991) identified a member of the cadherin family in myogenic mouse cells and referred to it as M-cadherin. It was not found in fibroblasts and was expressed at low levels in myoblasts. It is upregulated after induction of myotube formation, indicating a specific function in skeletal muscle

cell differentiation. Kaupmann et al. (1992) used a mouse myotube-derived cDNA encoding M-cadherin to demonstrate linkage of the gene (symbolized Cdh3 by them) to the gene for E-cadherin (uvomorulin; Um) in a mouse interspecific backcross. The linkage group is located on chromosome 8 in a region of conserved synteny with human chromosome 16q. The gene order was centromere--Junb--Um--Tat--(Cdh3/Aprt). The human homolog, symbolized CDH3 by them, was mapped to 16q24.1-qter by analyzing human/mouse somatic cell hybrids. Kremmidiotis et al. (1998) mapped the human CDH15 gene to 16q24.3 using somatic cell hybrid panels.

[13424] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13425] Donalies, M.; Cramer, M.; Ringwald, M.; Starzinski-Powitz, A. : Expression of M-cadherin, a member of the cadherin multigene family, correlates with differentiation of skeletal muscle cells. Proc. Nat. Acad. Sci. 88: 8024-8028, 1991. ; and

[13426] Kaupmann, K.; Becker-Follmann, J.; Scherer, G.; Jockusch, H.; Starzinski-Powitz, A. : The gene for the cell adhesion molecule M-cadherin maps to mouse chromosome 8 and

human chromosome.

[13427] Further studies establishing the function and utilities of CDH3 are found in John Hopkins OMIM database record ID 114019, and in cited publications numbered 11644–11646 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 1A (DYRK1A, Accession NM_001396) is another VGAM210 host target gene. DYRK1A BINDING SITE1 through DYRK1A BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DYRK1A, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DYRK1A BINDING SITE1 through DYRK1A BINDING SITE3, designated SEQ ID:7092, SEQ ID:28160 and SEQ ID:28185 respectively, to the nucleotide sequence of VGAM210 RNA, herein designated VGAM RNA, also designated SEQ ID:2921.

[13428] Another function of VGAM210 is therefore inhibition of Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 1A (DYRK1A, Accession NM_001396), a gene which regulates cell proliferation and may be involved in brain

development . Accordingly, utilities of VGAM210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DYRK1A. The function of DYRK1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM42. Interleukin 22 Receptor, Alpha 2 (IL22RA2, Accession NM_052962) is another VGAM210 host target gene. IL22RA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL22RA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL22RA2 BINDING SITE, designated SEQ ID:27521, to the nucleotide sequence of VGAM210 RNA, herein designated VGAM RNA, also designated SEQ ID:2921.

[13429] Another function of VGAM210 is therefore inhibition of Interleukin 22 Receptor, Alpha 2 (IL22RA2, Accession NM_052962), a gene which induces the production of acute-phase reactants. Accordingly, utilities of VGAM210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL22RA2. The func-

tion of IL22RA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM167. Jerky Homolog (mouse) (JRK, Accession XM_098818) is another VGAM210 host target gene. JRK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JRK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JRK BINDING SITE, designated SEQ ID:41834, to the nucleotide sequence of VGAM210 RNA, herein designated VGAM RNA, also designated SEQ ID:2921.

[13430] Another function of VGAM210 is therefore inhibition of Jerky Homolog (mouse) (JRK, Accession XM_098818), a gene which might function as a DNA-binding protein. Accordingly, utilities of VGAM210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JRK. The function of JRK has been established by previous studies. Toth et al. (1995) found that insertional inactivation of the mouse 'jerky' gene resulted in handling-induced whole body jerks, generalized clonic seizures, and epileptic brain activity. All homozygous ani-

mals displayed seizures. Homozygotes also displayed some degree of kyphosis of the thoracic spine and were proportionate dwarfs. Approximately half died before 3 months of age. Approximately 50% of the hemizygous animals showed generalized clonic seizures. The other hemizygous animals either displayed seizures limited to the head and limbs or showed no seizure activity. There was no apparent correlation between the level of jerky mRNA and the severity of seizures in hemizygotes. Toth et al. (1995) reported the sequence of jerky and a corrected version in a published erratum. The predicted protein has homology to several nuclear regulatory proteins, including CENPB (OMIM Ref. No. 117140), suggesting that jerky might function as a DNA-binding protein. By searching an EST database, Morita et al. (1998) identified a human infant brain cDNA encoding JH8 (jerky homolog of human on chromosome 8). Using this cDNA as a probe, they recovered additional clones corresponding to the entire JH8 coding region. The predicted 520-amino acid protein shares 76% and 41% sequence identity with jerky and HH-MJG (OMIM Ref. No. 603211), respectively. Northern blot analysis revealed that JH8 is expressed as a 9.5-kb mRNA in all tissues. Additional smaller bands were also detected.

Toth et al. (1995) mapped the jerky gene to mouse chromosome 15 by analysis of an interspecific backcross. By fluorescence in situ hybridization and analysis of a radiation hybrid panel, Morita et al. (1998) mapped the JH8 gene to 8q24. The mouse chromosome region containing jerky shows homology of synteny with human chromosome 8q24, suggesting that JH8, rather than HHMJG, is the human homolog of jerky. Morita et al. (1998) considered JH8 a prominent candidate gene for childhood absence epilepsy-1 (OMIM Ref. No. 600131), which maps to 8q24.

[13431] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13432] Morita, R.; Miyazaki, E.; Fong, C. G.; Chen, X.-N.; Korenberg, J. R.; Delgado-Escueta, A. V.; Yamakawa, K. : JH8, a gene highly homologous to the mouse jerky gene, maps to the region for childhood absence epilepsy on 8q24. Biochem. Biophys. Res. Commun. 248: 307-314, 1998. ; and

[13433] Toth, M.; Grimsby, J.; Buzsaki, G.; Donovan, G. P. : Epileptic seizures caused by inactivation of a novel gene, jerky, related to centromere binding protein-B in transgenic

mice. Nature.

[13434] Further studies establishing the function and utilities of JRK are found in John Hopkins OMIM database record ID 603210, and in cited publications numbered 5437–5438 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Pyruvate Dehydrogenase Kinase, Isoenzyme 4 (PDK4, Accession XM_173198) is another VGAM210 host target gene. PDK4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDK4 BINDING SITE, designated SEQ ID:46444, to the nucleotide sequence of VGAM210 RNA, herein designated VGAM RNA, also designated SEQ ID:2921.

[13435] Another function of VGAM210 is therefore inhibition of Pyruvate Dehydrogenase Kinase, Isoenzyme 4 (PDK4, Accession XM_173198). Accordingly, utilities of VGAM210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDK4. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 8 (PPP1R8, Accession NM_138558) is another VGAM210 host target

gene. PPP1R8 BINDING SITE1 through PPP1R8 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PPP1R8, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R8 BINDING SITE1 through PPP1R8 BINDING SITE3, designated SEQ ID:28858, SEQ ID:15342 and SEQ ID:8572 respectively, to the nucleotide sequence of VGAM210 RNA, herein designated VGAM RNA, also designated SEQ ID:2921.

[13436] Another function of VGAM210 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 8 (PPP1R8, Accession NM_138558), a gene which is an inhibitor subunit of the major nuclear protein phosphatase-1 (pp-1). Accordingly, utilities of VGAM210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R8. The function of PPP1R8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM101.SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily D, Member 1

(SMARCD1, Accession NM_003076) is another VGAM210 host target gene. SMARCD1 BINDING SITE1 and SMARCD1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SMARCD1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMARCD1 BINDING SITE1 and SMARCD1 BINDING SITE2, designated SEQ ID:9049 and SEQ ID:29147 respectively, to the nucleotide sequence of VGAM210 RNA, herein designated VGAM RNA, also designated SEQ ID:2921.

[13437] Another function of VGAM210 is therefore inhibition of SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily D, Member 1 (SMARCD1, Accession NM_003076), a gene which is involved in chromatin assembly and remodeling. Accordingly, utilities of VGAM210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCD1. The function of SMARCD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152. Transforming Growth Factor, Beta Receptor II (70/80kDa) (TGFB2, Accession

NM_003242) is another VGAM210 host target gene.

TGFBR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TGFBR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFBR2 BINDING SITE, designated SEQ ID:9241, to the nucleotide sequence of VGAM210 RNA, herein designated VGAM RNA, also designated SEQ ID:2921.

[13438] Another function of VGAM210 is therefore inhibition of Transforming Growth Factor, Beta Receptor II (70/80kDa) (TGFBR2, Accession NM_003242). Accordingly, utilities of VGAM210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFBR2. Thymidine Kinase 2, Mitochondrial (TK2, Accession NM_004614) is another VGAM210 host target gene. TK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TK2 BINDING SITE, designated SEQ ID:10958, to the nu-

cleotide sequence of VGAM210 RNA, herein designated VGAM RNA, also designated SEQ ID:2921.

[13439] Another function of VGAM210 is therefore inhibition of Thymidine Kinase 2, Mitochondrial (TK2, Accession NM_004614), a gene which phosphorylates thymidine, deoxycytidine, deoxyuridine, and also anti-viral and anti-cancer nucleoside analogs. Accordingly, utilities of VGAM210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TK2. The function of TK2 has been established by previous studies. Johansson and Karlsson (1997) cloned cDNAs encoding human TK2. The gene encodes a 234-amino acid polypeptide. Although TK2 is believed to reside in mitochondria, it contains no mitochondrial translocation signal sequence. Northern blot analysis revealed that TK2 was ubiquitously expressed as 2 transcripts of 2.4 and 4 kb. Expression of the TK2 cDNA revealed a 60-kD protein with phosphorylation activity similar to purified human TK2. Based on the partial protein sequence of human TK2, Wang et al. (1999) isolated a human brain TK2 cDNA. These authors noted that although the cDNA they isolated corresponds to the full-length mature protein, it is likely to be incomplete because it lacks the coding region for a

mitochondrial target presequence. They reported that the predicted protein sequence matched that of purified TK2, but differed at the N-terminus and at amino acid 28 from the TK2 sequence deduced by Johansson and Karlsson (1997). TK2 shares approximately 40% identity with deoxycytidine kinase (OMIM Ref. No. 125450) and deoxyguanosine kinase (OMIM Ref. No. 601465) on the amino acid level. Wang et al. (1999) characterized both recombinant and native TK2 forms and found that the enzyme has broad substrate specificity and complex kinetics, suggesting that it may play a role in the activation of chemotherapeutic nucleoside analogs. Northern blot analysis indicated that the TK2 gene was expressed as multiple transcripts, some of which show a tissue-specific pattern. The highest levels of expression were observed in testis and ovary. Saada et al. (2001) identified 2 mutations in TK2, his90 to asn(188250.0001) and ile181 to asn(188250.0002), in 4 individuals who developed devastating myopathy and depletion of muscular mtDNA in infancy. In these individuals, the activity of TK2 in muscle mitochondria was reduced to 14 to 45% of the mean value in healthy control individuals. Mandel et al. (2001) identified mutations in the DGUOK gene in another form of

mtDNA depletion syndrome, the hepatocerebral form (see OMIM Ref. No. 251880). They noted that the main supply of dNTPs for mtDNA synthesis comes from the salvage pathway initiated by DGK and TK2. The association of mtDNA depletion with mutations in the genes encoding these 2 kinases suggested that the salvage pathway enzymes are involved in the maintenance of balanced mitochondrial dNTP pools.

[13440] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13441] Wang, L.; Munch-Petersen, B.; Herrstrom Sjoberg, A.; Hellman, U.; Bergman, T.; Jornvall, H.; Eriksson, S. : Human thymidine kinase 2: molecular cloning and characterisation of the enzyme activity with antiviral and cytostatic nucleoside substrates. FEBS Lett. 443: 170-174, 1999. ; and

[13442] Saada, A.; Shaag, A.; Mandel, H.; Nevo, Y.; Eriksson, S.; Elpeleg, O. : Mutant mitochondrial thymidine kinase in mitochondrial DNA depletion myopathy. Nature Genet. 29: 342-344, 2001.

[13443] Further studies establishing the function and utilities of TK2 are found in John Hopkins OMIM database record ID

188250, and in cited publications numbered 10085–10089 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. WAS Protein Family, Member 1 (WASF1, Accession NM_003931) is another VGAM210 host target gene. WASF1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by WASF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WASF1 BINDING SITE, designated SEQ ID:10031, to the nucleotide sequence of VGAM210 RNA, herein designated VGAM RNA, also designated SEQ ID:2921.

[13444] Another function of VGAM210 is therefore inhibition of WAS Protein Family, Member 1 (WASF1, Accession NM_003931), a gene which is a downstream effector molecules involved in the transmission of signals to the actin cytoskeleton. Accordingly, utilities of VGAM210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WASF1. The function of WASF1 has been established by previous studies. Eden et al. (2002) reported a mechanism by which RAC1 and the adaptor protein NCK (OMIM Ref. No. 600508) activate

actin nucleation through WAVE1. WAVE1 exists in a heterotetrameric complex that includes orthologs of human PIR121 (OMIM Ref. No. 606323), NAP125 (OMIM Ref. No. 604891), and HSPC300. Whereas recombinant WAVE1 is constitutively active, the WAVE1 complex is inactive. Eden et al. (2002) proposed that Rac1 and Nck cause dissociation of the WAVE1 complex, which releases active WAVE1-HSPC300 and leads to actin nucleation. Eden et al. (2002) also determined that ABI2 (OMIM Ref. No. 606442) interacts with WAVE1 and appears to remain associated with the NAP125-PIR121 subcomplex upon dissociation of the WAVE1 complex. By searching databases for WASP-like molecules containing the highly conserved verprolin homology (VPH) domain, Miki et al. (1998) identified the KIAA0269 cDNA (Nagase et al., 1996) encoding WASF1, which they called WAVE. Sequence analysis predicted that WASF1 has no similarity to WASP or WASL in the N terminus, through which WASP and WASL are regulated by CDC42. The N terminus of WASF1 contains a putative leucine zipper motif and a highly basic region. The midsequence proline-rich region and the C-terminal VPH domain and highly acidic region of WASF1 are similar to WASP family proteins. Western blot analysis showed

higher expression of WASF1 in neuronal cell lines than in fibroblast or kidney cell lines. Confocal microscopy demonstrated that WASF1 is expressed in a dot-like pattern in the cytoplasm and is concentrated in RAC-regulated membrane-ruffling areas. Mutational analysis and immunofluorescence microscopy showed that WASF1 induces actin reorganization downstream of RAC. By screening a brain cDNA library using a yeast 2-hybrid

[13445] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13446] Eden, S.; Rohatgi, R.; Podtelejnikov, A. V.; Mann, M.; Kirschner, M. W. : Mechanism of regulation of WAVE1-induced actin nucleation by Rac1 and Nck. Nature 418: 790–793, 2002. ; and

[13448] Further studies establishing the function and utilities of WASF1 are found in John Hopkins OMIM database record ID 605035, and in cited publications numbered 10410, 1063 and 9011 listed in the bibliography section herein–

below, which are also hereby incorporated by reference. DKFZp434N074 (Accession XM_031481) is another VGAM210 host target gene. DKFZp434N074 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp434N074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434N074 BINDING SITE, designated SEQ ID:31389, to the nucleotide sequence of VGAM210 RNA, herein designated VGAM RNA, also designated SEQ ID:2921.

[13449] Another function of VGAM210 is therefore inhibition of DKFZp434N074 (Accession XM_031481). Accordingly, utilities of VGAM210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434N074. FLJ21477 (Accession NM_025153) is another VGAM210 host target gene. FLJ21477 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21477 BINDING SITE, designated SEQ ID:24789, to the

nucleotide sequence of VGAM210 RNA, herein designated VGAM RNA, also designated SEQ ID:2921.

[13450] Another function of VGAM210 is therefore inhibition of FLJ21477 (Accession NM_025153). Accordingly, utilities of VGAM210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21477. HSPC054 (Accession NM_014152) is another VGAM210 host target gene. HSPC054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPC054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC054 BINDING SITE, designated SEQ ID:15433, to the nucleotide sequence of VGAM210 RNA, herein designated VGAM RNA, also designated SEQ ID:2921.

[13451] Another function of VGAM210 is therefore inhibition of HSPC054 (Accession NM_014152). Accordingly, utilities of VGAM210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC054. P37NB (Accession NM_005824) is another VGAM210 host target gene. P37NB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by P37NB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P37NB BINDING SITE, designated SEQ ID:12434, to the nucleotide sequence of VGAM210 RNA, herein designated VGAM RNA, also designated SEQ ID:2921.

[13452] Another function of VGAM210 is therefore inhibition of P37NB (Accession NM_005824). Accordingly, utilities of VGAM210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P37NB. LOC114971 (Accession XM_054936) is another VGAM210 host target gene. LOC114971 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC114971, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC114971 BINDING SITE, designated SEQ ID:36209, to the nucleotide sequence of VGAM210 RNA, herein designated VGAM RNA, also designated SEQ ID:2921.

[13453] Another function of VGAM210 is therefore inhibition of LOC114971 (Accession XM_054936). Accordingly, utilities

of VGAM210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC114971. LOC133686 (Accession XM_059667) is another VGAM210 host target gene. LOC133686 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC133686, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133686 BINDING SITE, designated SEQ ID:37056, to the nucleotide sequence of VGAM210 RNA, herein designated VGAM RNA, also designated SEQ ID:2921.

[13454] Another function of VGAM210 is therefore inhibition of LOC133686 (Accession XM_059667). Accordingly, utilities of VGAM210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133686. LOC146226 (Accession XM_096946) is another VGAM210 host target gene. LOC146226 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146226, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC146226 BINDING SITE, designated SEQ ID:40662, to the nucleotide sequence of VGAM210 RNA, herein designated VGAM RNA, also designated SEQ ID:2921.

[13455] Another function of VGAM210 is therefore inhibition of LOC146226 (Accession XM_096946). Accordingly, utilities of VGAM210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146226. LOC253263 (Accession XM_173102) is another VGAM210 host target gene. LOC253263 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253263, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253263 BINDING SITE, designated SEQ ID:46361, to the nucleotide sequence of VGAM210 RNA, herein designated VGAM RNA, also designated SEQ ID:2921.

[13456] Another function of VGAM210 is therefore inhibition of LOC253263 (Accession XM_173102). Accordingly, utilities of VGAM210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253263. LOC90362 (Accession XM_031163) is another VGAM210 host target gene. LOC90362 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90362, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90362 BINDING SITE, designated SEQ ID:31295, to the nucleotide sequence of VGAM210 RNA, herein designated VGAM RNA, also designated SEQ ID:2921.

[13457] Another function of VGAM210 is therefore inhibition of LOC90362 (Accession XM_031163). Accordingly, utilities of VGAM210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90362. LOC91263 (Accession XM_037264) is another VGAM210 host target gene. LOC91263 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91263, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91263 BINDING SITE, designated SEQ ID:32596, to the nucleotide sequence of VGAM210 RNA, herein designated VGAM RNA, also designated SEQ ID:2921.

[13458] Another function of VGAM210 is therefore inhibition of

LOC91263 (Accession XM_037264). Accordingly, utilities of VGAM210 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91263. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 211 (VGAM211) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13459] VGAM211 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM211 was detected is described hereinabove with reference to Figs. 1–8.

[13460] VGAM211 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Simian Virus 40.

VGAM211 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13461] VGAM211 gene encodes a VGAM211 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM211 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM211 precursor RNA is designated SEQ ID:197, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:197 is located at position 112 relative to the genome of Simian Virus 40.

[13462] VGAM211 precursor RNA folds onto itself, forming VGAM211 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13463] An enzyme complex designated DICER COMPLEX, `dices` the VGAM211 folded precursor RNA into VGAM211 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide se-

quence of VGAM211 RNA is designated SEQ ID:2922, and is provided hereinbelow with reference to the sequence listing part.

[13464] VGAM211 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM211 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM211 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[13465] VGAM211 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM211 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM211 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM211 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM211 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[13466] The complementary binding of VGAM211 RNA, herein designated VGAM RNA, to host target binding sites on VGAM211 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM211 host target RNA into VGAM211 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13467] It is appreciated that VGAM211 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM211 host target genes. The mRNA of each one of this plurality of VGAM211 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM211 RNA, herein designated VGAM RNA, and which when bound by VGAM211 RNA causes inhibition of translation of respective one or more VGAM211 host target proteins.

[13468] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM211 gene, herein designated VGAM GENE, on one or more VGAM211 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[13469] It is yet further appreciated that a function of VGAM211 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM211 include diagnosis, prevention and treatment of viral infection by Simian Virus 40. Specific functions, and accordingly utilities, of VGAM211 correlate with, and may be deduced from, the identity of the host target genes which VGAM211 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13470] Nucleotide sequences of the VGAM211 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM211 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM211 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM211 are further described hereinbelow with reference to Table 1.

[13471] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM211 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM211 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13472] As mentioned hereinabove with reference to Fig. 1, a function of VGAM211 gene, herein designated VGAM is inhibition of expression of VGAM211 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM211 correlate with, and may be deduced from, the identity of the target genes which VGAM211 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13473] A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 3 (ADAMTS3, Accession NM_014243) is a VGAM211 host target gene. ADAMTS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAMTS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTS3 BINDING SITE, designated SEQ ID:15509, to the nucleotide sequence of VGAM211 RNA, herein designated VGAM RNA, also designated SEQ ID:2922.

[13474] A function of VGAM211 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 3 (ADAMTS3, Accession

NM_014243), a gene which cleaves the propeptides of type ii collagen prior to fibril assembly. Accordingly, utilities of VGAM211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS3. The function of ADAMTS3 has been established by previous studies. Members of the ADAMTS family contain a signal peptide, a prodomain, a metalloproteinase domain, a disintegrin-like domain, varying numbers of thrombospondin type 1 motifs, and a cysteine-rich domain. See ADAMTS5 (OMIM Ref. No. 605007) for additional background information on the ADAMTS family. By sequencing randomly selected cDNAs corresponding to relatively long transcripts from human brain, Nagase et al. (1997) identified a partial ADAMTS3 cDNA, which they called KIAA0366, that lacked 5-prime coding sequence. The deduced partial ADAMTS3 protein had 1,201 amino acids. In vitro transcribed/translated ADAMTS3 protein had an apparent molecular mass of larger than 100 kD by SDS-PAGE. The authors examined ADAMTS3 expression in 14 human tissues using RT-PCR. By radiation hybrid mapping, Nagase et al. (1997) mapped the ADAMTS3 gene to chromosome 4. Hurskainen et al. (1999) mapped the ADAMTS3 gene to chromosome 4 using somatic cell hy-

brid analysis. They localized the ADAMTS3 gene to 4q21 by radiation hybrid mapping.

[13475] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13476] Nagase, T.; Ishikawa, K.; Nakajima, D.; Ohira, M.; Seki, N.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. VII. The complete sequences of 100 new cDNA clones from brain which can code for large proteins in vitro. DNA Res. 4: 141–150, 1997. ; and

[13477] Hurskainen, T. L.; Hirohata, S.; Seldin, M. F.; Apte, S. S. : ADAM–TS5, ADAM–TS6, and ADAM–TS7, novel members of a new family of zinc metalloproteases: general features and genomic distr.

[13478] Further studies establishing the function and utilities of ADAMTS3 are found in John Hopkins OMIM database record ID 605011, and in cited publications numbered 760 and 7605 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ADP–ribosylation Factor 4–like (ARF4L, Accession XM_045890) is another VGAM211 host target gene. ARF4L BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by ARF4L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARF4L BINDING SITE, designated SEQ ID:34604, to the nucleotide sequence of VGAM211 RNA, herein designated VGAM RNA, also designated SEQ ID:2922.

[13479] Another function of VGAM211 is therefore inhibition of ADP-ribosylation Factor 4-like (ARF4L, Accession XM_045890). Accordingly, utilities of VGAM211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARF4L. ELAV (embryonic lethal, abnormal vision, Drosophila)-like 2 (Hu antigen B) (ELAVL2, Accession NM_004432) is another VGAM211 host target gene. ELAVL2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ELAVL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELAVL2 BINDING SITE, designated SEQ ID:10717, to the nucleotide sequence of VGAM211 RNA, herein designated VGAM RNA, also designated SEQ ID:2922.

[13480] Another function of VGAM211 is therefore inhibition of ELAV (embryonic lethal, abnormal vision, *Drosophila*)-like 2 (Hu antigen B) (ELAVL2, Accession NM_004432), a gene which binds rna. seems to recognize a gaaa motif. can bind to its own 3' untranslated region (3'utr), the c-fos 3'utr and the id 3'utr. Accordingly, utilities of VGAM211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELAVL2. The function of ELAVL2 has been established by previous studies. Hel-N1 is an evolutionarily conserved neural-specific RNA-binding protein expressed in neurons of the brain. The rat and human cDNAs were cloned by King et al. (1994). The human cDNA, symbolized ELAVL2 for 'embryonic lethal abnormal vision-like 2,' encodes a predicted 359-amino acid protein that shows significant similarity to the product of the *Drosophila* elav gene, the absence of which causes multiple structural defects and hypotrophy of the fly's central nervous system. In situ hybridization of rat tissues demonstrated that the mRNA occurs within a subset of neurons of the hippocampus, cortex, and other areas of the gray matter (King et al., 1994). Hel-N1 was shown to bind in vitro to the 3-prime untranslated region of an mRNA for Id (OMIM Ref. No. 600349), an inhibitor of

DNA binding. King (1994) showed that alternative splicing of a 91-bp exon produces a longer isoform. The ELAVL2-homologous gene is referred to as Hub in the mouse. It is one of the tumor antigens that underlie paraneoplastic neurologic disorders (PND), which arise when an immune response to systemic tumors expressing neuronal proteins ('onconeural antigens') develops into an autoimmune neuronal degeneration (Fletcher et al., 1997). It is in the class of neuron-specific RNA-binding proteins. Han et al. (1996) mapped the ELAVL2 gene to 9p21 by chromosome microdissection PCR and by fluorescence in situ hybridization. Fletcher et al. (1997) demonstrated that the mouse gene maps to mouse chromosome 4 close to the homolog of interferon alpha (OMIM Ref. No. 147660), which maps to 9p22 in the human genome

[13481] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13482] Fletcher, C. F.; Okano, H. J.; Gilbert, D. J.; Yang, Y.; Yang, C.; Copeland, N. G.; Jenkins, N. A.; Darnell, R. B. : Mouse chromosomal locations of nine genes encoding homologs of human paraneoplastic neurologic disorder antigens. Genomics 45: 313–319, 1997. ; and

[13483] Han, J.; Knops, J. F.; Longshore, J. W.; King, P. H. : Localization of human elav-like neuronal protein 1 (Hel-N1) on chromosome 9p21 by chromosome microdissection polymerase chain react.

[13484] Further studies establishing the function and utilities of ELAVL2 are found in John Hopkins OMIM database record ID 601673, and in cited publications numbered 238 and 9482-9484 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fyn-related Kinase (FRK, Accession NM_002031) is another VGAM211 host target gene. FRK BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FRK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FRK BINDING SITE, designated SEQ ID:7785, to the nucleotide sequence of VGAM211 RNA, herein designated VGAM RNA, also designated SEQ ID:2922.

[13485] Another function of VGAM211 is therefore inhibition of Fyn-related Kinase (FRK, Accession NM_002031), a gene which binds pRb (RB1) during G1 and S phase and suppresses growth. Accordingly, utilities of VGAM211 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with FRK. The function of FRK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM157. Spondin 1, (f-spondin) Extracellular Matrix Protein (SPON1, Accession XM_031184) is another VGAM211 host target gene. SPON1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPON1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPON1 BINDING SITE, designated SEQ ID:31302, to the nucleotide sequence of VGAM211 RNA, herein designated VGAM RNA, also designated SEQ ID:2922.

[13486] Another function of VGAM211 is therefore inhibition of Spondin 1, (f-spondin) Extracellular Matrix Protein (SPON1, Accession XM_031184). Accordingly, utilities of VGAM211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPON1. Transcription Elongation Factor A (SII), 1 (TCEA1, Accession XM_087370) is another VGAM211 host target gene.

TCEA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCEA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCEA1 BINDING SITE, designated SEQ ID:39202, to the nucleotide sequence of VGAM211 RNA, herein designated VGAM RNA, also designated SEQ ID:2922.

[13487] Another function of VGAM211 is therefore inhibition of Transcription Elongation Factor A (SII), 1 (TCEA1, Accession XM_087370), a gene which helps RNA polymerase II to transcribe past blockages. Accordingly, utilities of VGAM211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCEA1. The function of TCEA1 has been established by previous studies. Transcription elongation factors help RNA polymerase II (see OMIM Ref. No. 180660) to transcribe past blockages due to specific DNA sequences, DNA-binding proteins, and transcription-arresting drugs. Transcription elongation factors in humans fall into 2 classes: the SIII (see OMIM Ref. No. 600788)/TF2F (see OMIM Ref. No. 189968) class, members of which increase the average

rate of RNA chain elongation (Aso et al., 1995); and the SII class, which releases RNA polymerase II from transcriptional arrest (Reines, 1994). Park et al. (1994) cloned and characterized a human gene encoding an SII-type elongation factor. The gene, designated TFIIIS by them, is 2.8 kb long, intronless, and produces a 2.5-kb transcript. DiMarco et al. (1996) designed PCR primers for the SII gene (also symbolized TCEA) and mapped it to human chromosome 3 by analysis of human-rodent hybrid mapping panel. Further regionalization to 3p22-p21.3 was accomplished by fluorescence in situ hybridization using a YAC containing the gene. DiMarco et al. (1996) cited reports that this region of 3p exhibits loss of heterozygosity (LOH) in small- and non-small-cell lung carcinomas as well as several other malignancies. Thomas et al. (1998) addressed whether the intrinsic 3-prime to 5-prime nuclease activity of human RNA polymerase II (OMIM Ref. No. pol II) can proofread during transcription in vitro. In the presence of SII, a protein that stimulates the nuclease activity, pol II quantitatively removed misincorporated nucleotides from the nascent transcript during rapid chain extension. The basis of discrimination between the correct and incorrect base was the slow addition of the next nu-

cleotide to the mismatched terminus. Incorporation of inosine monophosphate inhibited the next nucleotide addition by a similar magnitude as a mismatched base.

Thomas et al. (1998) demonstrated that addition of SII to a transcription reaction dramatically altered the RNA base content, reflecting the stable incorporation of more 'correct' (GMP) and fewer 'incorrect' (IMP) nucleotides.

[13488] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13489] DiMarco, S. P.; Glover, T. W.; Miller, D. E.; Reines, D.; Warren, S. T. : Transcription elongation factor SII (TCEA) maps to human chromosome 3p22–p21.3. *Genomics* 36: 185–188, 1996. ; and

[13490] Thomas, M. J.; Platas, A. A.; Hawley, D. K. : Transcriptional fidelity and proofreading by RNA polymerase II. *Cell* 93: 627–637, 1998.

[13491] Further studies establishing the function and utilities of TCEA1 are found in John Hopkins OMIM database record ID 601425, and in cited publications numbered 1020 and 9273–9276 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 5 Open Reading Frame 4 (C5orf4, Ac-

cession NM_016348) is another VGAM211 host target gene. C5orf4 BINDING SITE1 and C5orf4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by C5orf4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf4 BINDING SITE1 and C5orf4 BINDING SITE2, designated SEQ ID:18474 and SEQ ID:26180 respectively, to the nucleotide sequence of VGAM211 RNA, herein designated VGAM RNA, also designated SEQ ID:2922.

[13492] Another function of VGAM211 is therefore inhibition of Chromosome 5 Open Reading Frame 4 (C5orf4, Accession NM_016348). Accordingly, utilities of VGAM211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf4. FLJ11175 (Accession NM_018349) is another VGAM211 host target gene. FLJ11175 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11175, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11175 BINDING SITE, designated

SEQ ID:20360, to the nucleotide sequence of VGAM211 RNA, herein designated VGAM RNA, also designated SEQ ID:2922.

[13493] Another function of VGAM211 is therefore inhibition of FLJ11175 (Accession NM_018349). Accordingly, utilities of VGAM211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11175. FLJ14054 (Accession NM_024563) is another VGAM211 host target gene. FLJ14054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14054 BINDING SITE, designated SEQ ID:23785, to the nucleotide sequence of VGAM211 RNA, herein designated VGAM RNA, also designated SEQ ID:2922.

[13494] Another function of VGAM211 is therefore inhibition of FLJ14054 (Accession NM_024563). Accordingly, utilities of VGAM211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14054. Hippocalcin Like 4 (HPCAL4, Accession NM_016257) is another VGAM211 host target gene. HPCAL4 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HPCAL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPCAL4 BINDING SITE, designated SEQ ID:18387, to the nucleotide sequence of VGAM211 RNA, herein designated VGAM RNA, also designated SEQ ID:2922.

[13495] Another function of VGAM211 is therefore inhibition of Hippocalcin Like 4 (HPCAL4, Accession NM_016257). Accordingly, utilities of VGAM211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPCAL4. KIAA0931 (Accession XM_041191) is another VGAM211 host target gene. KIAA0931 BINDING SITE1 and KIAA0931 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0931, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0931 BINDING SITE1 and KIAA0931 BINDING SITE2, designated SEQ ID:33483 and SEQ ID:33485 respectively, to the nucleotide sequence of VGAM211 RNA, herein designated VGAM RNA,

also designated SEQ ID:2922.

[13496] Another function of VGAM211 is therefore inhibition of KIAA0931 (Accession XM_041191). Accordingly, utilities of VGAM211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0931. KIAA1198 (Accession XM_032674) is another VGAM211 host target gene. KIAA1198 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1198, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1198 BINDING SITE, designated SEQ ID:31709, to the nucleotide sequence of VGAM211 RNA, herein designated VGAM RNA, also designated SEQ ID:2922.

[13497] Another function of VGAM211 is therefore inhibition of KIAA1198 (Accession XM_032674). Accordingly, utilities of VGAM211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1198. PXR2b (Accession NM_016559) is another VGAM211 host target gene. PXR2b BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PXR2b, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PXR2b BINDING SITE, designated SEQ ID:18633, to the nucleotide sequence of VGAM211 RNA, herein designated VGAM RNA, also designated SEQ ID:2922.

[13498] Another function of VGAM211 is therefore inhibition of PXR2b (Accession NM_016559). Accordingly, utilities of VGAM211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PXR2b. LOC120856 (Accession XM_058509) is another VGAM211 host target gene. LOC120856 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC120856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120856 BINDING SITE, designated SEQ ID:36632, to the nucleotide sequence of VGAM211 RNA, herein designated VGAM RNA, also designated SEQ ID:2922.

[13499] Another function of VGAM211 is therefore inhibition of LOC120856 (Accession XM_058509). Accordingly, utilities of VGAM211 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC120856. LOC200853 (Accession XM_114308) is another VGAM211 host target gene. LOC200853 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200853, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200853 BINDING SITE, designated SEQ ID:42866, to the nucleotide sequence of VGAM211 RNA, herein designated VGAM RNA, also designated SEQ ID:2922.

[13500] Another function of VGAM211 is therefore inhibition of LOC200853 (Accession XM_114308). Accordingly, utilities of VGAM211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200853. LOC203084 (Accession XM_113540) is another VGAM211 host target gene. LOC203084 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203084, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203084 BINDING SITE, designated SEQ ID:42280, to

the nucleotide sequence of VGAM211 RNA, herein designated VGAM RNA, also designated SEQ ID:2922.

[13501] Another function of VGAM211 is therefore inhibition of LOC203084 (Accession XM_113540). Accordingly, utilities of VGAM211 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203084. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 212 (VGAM212) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13502] VGAM212 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM212 was detected is described hereinabove with reference to Figs. 1–8.

[13503] VGAM212 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Simian Virus 40. VGAM212 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13504] VGAM212 gene encodes a VGAM212 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM212 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM212 precursor RNA is designated SEQ ID:198, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:198 is located at position 2253 relative to the genome of Simian Virus 40.

[13505] VGAM212 precursor RNA folds onto itself, forming VGAM212 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13506] An enzyme complex designated DICER COMPLEX, `dices` the VGAM212 folded precursor RNA into VGAM212 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM212 RNA is designated SEQ ID:2923, and is provided hereinbelow with reference to the sequence listing part.

[13507] VGAM212 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM212 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM212 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[13508] VGAM212 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM212 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM212 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM212 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM212 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13509] The complementary binding of VGAM212 RNA, herein designated VGAM RNA, to host target binding sites on VGAM212 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM212 host target RNA into VGAM212 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13510] It is appreciated that VGAM212 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM212 host target genes. The mRNA of each one of this plurality of VGAM212 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM212 RNA, herein designated VGAM RNA, and which when bound by VGAM212 RNA causes inhibition of translation of respective one or more VGAM212 host target proteins.

[13511] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM212 gene, herein designated VGAM GENE, on one or more VGAM212 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[13512] It is yet further appreciated that a function of VGAM212 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of viral infection by Simian Virus 40. Specific functions, and accordingly utilities, of VGAM212 correlate with, and may be deduced from, the identity of the host target genes which VGAM212 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[13513] Nucleotide sequences of the VGAM212 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM212 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM212 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM212 are further described hereinbelow with reference to Table 1.

[13514] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM212 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM212 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13515] As mentioned hereinabove with reference to Fig. 1, a function of VGAM212 gene, herein designated VGAM is inhibition of expression of VGAM212 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM212 correlate with, and may be deduced from, the identity of the target genes which VGAM212 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13516] Acid Phosphatase 2, Lysosomal (ACP2, Accession NM_001610) is a VGAM212 host target gene. ACP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACP2 BINDING SITE, designated SEQ ID:7319, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13517] A function of VGAM212 is therefore inhibition of Acid Phosphatase 2, Lysosomal (ACP2, Accession NM_001610).

Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACP2. Angiopoietin 2 (ANGPT2, Accession NM_001147) is another VGAM212 host target gene.

ANGPT2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ANGPT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANGPT2 BINDING SITE, designated SEQ ID:6818, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13518] Another function of VGAM212 is therefore inhibition of Angiopoietin 2 (ANGPT2, Accession NM_001147), a gene which is a vascular endothelial growth factor that acts as an antagonist of TIE2 (TEK) receptor protein tyrosine kinase. Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANGPT2. The function of ANGPT2 has been established by previous studies. Tanaka et al. (1999) investigated angiopoietin expression in 23 samples of hepatocellular carcinoma (HCC) and paired adjacent

uninvolved liver samples to determine if these genes have a potential role in the growth and spread of the malignancy. They obtained the full coding sequence of a variant angiopoietin-2 cDNA from HCC specimens, and the biologic consequences of overexpression on tumor formation and hemorrhage were determined in an animal model system. Angiopoietin-1 was equally expressed in HCC and adjacent noncarcinomatous liver tissue. On the other hand, angiopoietin-2 was found to be highly expressed only in tumor tissue. In addition, angiopoietin-2 was expressed in 10 of 12 hypervascular HCCs, but only in 2 of 11 hypovascular HCCs. Ectopic expression of angiopoietin-2 in nonexpressing HCC cells promoted the rapid development of human hepatomas and produced hemorrhage within tumors in nude mice. These results suggested a role for angiopoietin-2 in the neovascularization of HCC. The enhanced gene expression may contribute to the clinical hypervascular phenotype as well as to tumor formation and progression. To explore the possibility that VEGF and angiopoietins collaborate during tumor angiogenesis, Holash et al. (1999) analyzed several different murine and human tumor models. Holash et al. (1999) noted that angiopoietin-1 was antiapoptotic for cultured

endothelial cells and expression of its antagonist angiopoietin-2 was induced in the endothelium of co-opted tumor vessels before their regression. Expression of Ang2 continued to mark not only the few surviving internal vessels but also the angiogenic vessels at the tumor margin, suggesting that the destabilizing action of angiopoietin-2 facilitates the angiogenic action of VEGF at the tumor rim. Holash et al. (1999) examined human glioblastomas. Angiopoietin-2 was not detectable in the normal human brain, but its expression was dramatically induced in co-opted tumor vessels, preceding vessel regression. Holash et al. (1999) implanted rat RBA mammary adenocarcinoma cells into rat brains. Co-opted vessels displayed striking and specific upregulation of angiopoietin-2, which was not detectable in the vessels of adjacent brain tissue. Holash et al. (1999) concluded that their observations indicate that a subset of tumors rapidly co-opts existing host vessels to form an initially well-vascularized tumor mass. Perhaps as part of a host defense mechanism there is widespread regression of these initially co-opted vessels, leading to a secondarily avascular tumor and a massive tumor cell loss. However, the remaining tumor is ultimately rescued by robust angiogenesis at the tumor mar-

gin.

- [13521] Tanaka, S.; Mori, M.; Sakamoto, Y.; Makuuchi, M.; Sugimachi, K.; Wands, J. R. : Biologic significance of angiopoietin-2 expression in human hepatocellular carcinoma. J. Clin. Invest. 10.
- [13522] Further studies establishing the function and utilities of ANGPT2 are found in John Hopkins OMIM database record ID 601922, and in cited publications numbered 9394, 10441–581 and 9401 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Collagen, Type V, Alpha 3 (COL5A3, Accession NM_015719) is another VGAM212 host target gene. COL5A3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COL5A3, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL5A3 BINDING SITE, designated SEQ ID:17934, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13523] Another function of VGAM212 is therefore inhibition of Collagen, Type V, Alpha 3 (COL5A3, Accession NM_015719). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL5A3. Deleted In Lymphocytic Leukemia, 2 (DLEU2, Accession NM_006021) is another VGAM212 host target gene. DLEU2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DLEU2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLEU2 BINDING SITE, designated SEQ ID:12639, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13524] Another function of VGAM212 is therefore inhibition of Deleted In Lymphocytic Leukemia, 2 (DLEU2, Accession

NM_006021). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLEU2. Junctional Adhesion Molecule 3 (JAM3, Accession NM_032801) is another VGAM212 host target gene. JAM3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JAM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JAM3 BINDING SITE, designated SEQ ID:26556, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13525] Another function of VGAM212 is therefore inhibition of Junctional Adhesion Molecule 3 (JAM3, Accession NM_032801), a gene which is a member of the junctional adhesion molecule protein family. Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAM3. The function of JAM3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.V-myc Myelocytomatosis Viral Oncogene Ho-

molog 2 (avian) (MYCL2, Accession NM_005377) is another VGAM212 host target gene. MYCL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYCL2 BINDING SITE, designated SEQ ID:11859, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13526] Another function of VGAM212 is therefore inhibition of V-myc Myelocytomatosis Viral Oncogene Homolog 2 (avian) (MYCL2, Accession NM_005377). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYCL2. Nerve Growth Factor Receptor (TNFR superfamily, member 16) (NGFR, Accession NM_002507) is another VGAM212 host target gene. NGFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NGFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NGFR BINDING SITE, desig-

nated SEQ ID:8337, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13527] Another function of VGAM212 is therefore inhibition of Nerve Growth Factor Receptor (TNFR superfamily, member 16) (NGFR, Accession NM_002507), a gene which can mediate cell survival as well as cell death of neural cells. Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NGFR. The function of NGFR has been established by previous studies. Bothwell (1996), Carter and Lewin (1997), and Bibel and Barde (2000) reviewed neurotrophins and their receptors. Nerve growth factor receptor (NGFR) is also referred to as p75(NTR) due to its molecular mass and its ability to bind at low affinity not only NGF (see OMIM Ref. No. 162030), but also other neurotrophins, including brain-derived neurotrophic factor (BDNF; 113505), neurotrophin-3 (NTF3; 162660), and neurotrophin-4/5 (NTF5; 162662). At the time of its discovery, NGFR was considered a unique type of protein. Subsequently, however, a large superfamily of tumor necrosis factor receptors were found to share the overall structure of NGFR (4 extracellular ligand-binding, cys-

teine-rich repeats, or CRs, and signaling through association with, or disassociation from, cytoplasmic interactors). The identification of this superfamily helped elucidate some of the biologic functions of NGFR, including its ultimate involvement in the nuclear factor kappa-B (NFKB; OMIM Ref. No. 164011) and apoptosis pathways. As a monomer, NGFR binds NGF with low affinity. Higher affinity binding is achieved by association with higher molecular mass, low-affinity neurotrophin receptors, namely the tropomyosin receptor kinases, TRKA (NTRK1; 191315), TRKB (NTRK2; 600456), and TRKC (NTRK3; 191316). TRKA, TRKB, and TRKC are specific for or 'preferred by' NGF, NTF5 and BDNF, and NTF3, respectively (Ip et al., 1993). NTF3 also binds to TRKA and TRKB, but with significantly lower affinity. Animal model experiments lend further support to the function of NGFR. By targeted disruption of exon 3 of the *Ngfr* gene, which encodes CR2, CR3, and CR4, Lee et al. (1992) generated mice lacking functional *Ngfr*. The *Ngfr* $-/-$ mice were viable and fertile but developed skin defects in all extremities as well as ulcers that were prone to secondary infection with loss of epidermis. Immunohistochemistry revealed a lack of calcitonin gene-related peptide (CALCA; 114130)- and sub-

stance P (OMIM Ref. No. 162320)–expressing peripheral sensory nerve fibers. Mutant mice had a loss of heat sensitivity but no defects in innervation of the iris or salivary gland. Mice carrying a single copy of a human NGFR transgene did not have neuropeptide and sensory loss or the peripheral ulcers.

[13528] It is appreciated that the abovementioned animal model for NGFR is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[13529] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13530] Bibel, M.; Barde, Y.–A. : Neurotrophins: key regulators of cell fate and cell shape in the vertebrate nervous system. *Genes Dev.* 14: 2919–2937, 2000. ; and

[13531] Lee, K. F.; Li, E.; Huber, J.; Landis, S. C.; Sharpe, A. H.; Chao, M. V.; Jaenisch, R. : Targeted mutation of the gene encoding the low affinity NGF receptor p75 leads to deficits in t.

[13532] Further studies establishing the function and utilities of NGFR are found in John Hopkins OMIM database record ID 162010, and in cited publications numbered 1938–1944,

181 and 2227-2235 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. POU Domain, Class 3, Transcription Factor 1 (POU3F1, Accession XM_001334) is another VGAM212 host target gene. POU3F1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POU3F1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POU3F1 BINDING SITE, designated SEQ ID:29832, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13533] Another function of VGAM212 is therefore inhibition of POU Domain, Class 3, Transcription Factor 1 (POU3F1, Accession XM_001334), a gene which involves in early embryogenesis and neurogenesis. Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POU3F1. The function of POU3F1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM85. Selenoprotein N, 1 (SEPN1, Accession

XM_039033) is another VGAM212 host target gene. SEPN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEPN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEPN1 BINDING SITE, designated SEQ ID:32990, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13534] Another function of VGAM212 is therefore inhibition of Selenoprotein N, 1 (SEPN1, Accession XM_039033). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEPN1. Vesicle Amine Transport Protein 1 Homolog (T californica) (VAT1, Accession NM_006373) is another VGAM212 host target gene. VAT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VAT1 BINDING SITE, designated SEQ ID:13068, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA,

also designated SEQ ID:2923.

[13535] Another function of VGAM212 is therefore inhibition of Vesicle Amine Transport Protein 1 Homolog (T californica) (VAT1, Accession NM_006373), a gene which is a membrane protein of cholinergic synaptic vesicles. Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VAT1. The function of VAT1 has been established by previous studies. Synaptic vesicles are responsible for regulating the storage and release of neurotransmitters in the nerve terminal. Using expression screening of a marine ray (Torpedo) electric lobe library, Linial et al. (1989) identified a cDNA encoding a 379-amino acid synaptic vesicle integral membrane protein, which they termed VAT1. Northern blot analysis revealed that a 5.8-kb transcript is expressed in electromotor neurons. Western blot analysis determined expression of a 42-kD protein in the electric organ that copurified with synaptic vesicles. While attempting to identify the BRCA1 (OMIM Ref. No. 113705) gene, Friedman et al. (1995) cloned cDNAs for a number of genes on chromosome 17q21, including one with significant homology to Torpedo VAT1. By random sequencing of 4 cosmids from a human chro-

mosome 17-specific library, Smith et al. (1996) identified the sequence of 2 complete genes within 117 kb of DNA containing the BRCA1 gene: RHO7 (OMIM Ref. No. 601555) and VAT1, an abundant membrane protein of cholinergic synaptic vesicles. The coding sequence of VAT1 predicts a 301-amino acid peptide. The authors found that a CpG island precedes the VAT1 gene, which contains 6 exons spanning 8.1 kb. They determined the following order of genes in this region: cen--IFP35 (OMIM Ref. No. 600735)--VAT1--RHO7--BRCA1--1A1-3B--tel.

[13536] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13537] Linial, M.; Miller, K.; Scheller, R. H. : VAT-1: an abundant membrane protein from Torpedo cholinergic synaptic vesicles. Neuron 2: 1265-1273, 1989. ; and

[13538] Friedman, L. S.; Ostermeyer, E. A.; Lynch, E. D.; Welcsh, P.; Szabo, C. I.; Meza, J. E.; Anderson, L. A.; Dowd, P.; Lee, M. K.; Rowell, S. E.; Ellison, J.; Boyd, J.; King, M.-C. : 22 genes.

[13539] Further studies establishing the function and utilities of VAT1 are found in John Hopkins OMIM database record ID 604631, and in cited publications numbered 4982-4984

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Bromodomain and PHD Finger Containing, 3 (BRPF3, Accession XM_166450) is another VGAM212 host target gene. BRPF3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BRPF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRPF3 BINDING SITE, designated SEQ ID:44345, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13540] Another function of VGAM212 is therefore inhibition of Bromodomain and PHD Finger Containing, 3 (BRPF3, Accession XM_166450). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRPF3. DKFZP434P0721 (Accession XM_033181) is another VGAM212 host target gene. DKFZP434P0721 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434P0721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of DKFZP434P0721 BINDING SITE, designated SEQ ID:31871, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13541] Another function of VGAM212 is therefore inhibition of DKFZP434P0721 (Accession XM_033181). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P0721. Family with Sequence Similarity 3, Member D (FAM3D, Accession NM_138805) is another VGAM212 host target gene. FAM3D BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FAM3D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FAM3D BINDING SITE, designated SEQ ID:29029, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13542] Another function of VGAM212 is therefore inhibition of Family with Sequence Similarity 3, Member D (FAM3D, Accession NM_138805). Accordingly, utilities of VGAM212

include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAM3D. FHX (Accession NM_018416) is another VGAM212 host target gene. FHX BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FHX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHX BINDING SITE, designated SEQ ID:20464, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13543] Another function of VGAM212 is therefore inhibition of FHX (Accession NM_018416). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHX. FLJ12800 (Accession NM_022903) is another VGAM212 host target gene. FLJ12800 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12800, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12800 BINDING SITE, designated SEQ ID:23195, to the nucleotide sequence of

VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13544] Another function of VGAM212 is therefore inhibition of FLJ12800 (Accession NM_022903). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12800. FLJ13955 (Accession NM_024759) is another VGAM212 host target gene. FLJ13955 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13955 BINDING SITE, designated SEQ ID:24110, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13545] Another function of VGAM212 is therefore inhibition of FLJ13955 (Accession NM_024759). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13955. FLJ20666 (Accession NM_017922) is another VGAM212 host target gene. FLJ20666 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ20666, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20666 BINDING SITE, designated SEQ ID:19587, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13546] Another function of VGAM212 is therefore inhibition of FLJ20666 (Accession NM_017922). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20666. FLJ20958 (Accession NM_022102) is another VGAM212 host target gene. FLJ20958 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20958 BINDING SITE, designated SEQ ID:22647, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13547] Another function of VGAM212 is therefore inhibition of FLJ20958 (Accession NM_022102). Accordingly, utilities of

VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20958. G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM_139201) is another VGAM212 host target gene. GIT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GIT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GIT2 BINDING SITE, designated SEQ ID:29214, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13548] Another function of VGAM212 is therefore inhibition of G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM_139201). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GIT2. HPIP (Accession NM_020524) is another VGAM212 host target gene. HPIP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HPIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of HPIP BINDING SITE, designated SEQ ID:21739, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13549] Another function of VGAM212 is therefore inhibition of HPIP (Accession NM_020524). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPIP. KIAA0544 (Accession XM_048119) is another VGAM212 host target gene. KIAA0544 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0544, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0544 BINDING SITE, designated SEQ ID:35114, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13550] Another function of VGAM212 is therefore inhibition of KIAA0544 (Accession XM_048119). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0544. KIAA1198 (Accession XM_032674) is another VGAM212 host target gene. KIAA1198 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1198, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1198 BINDING SITE, designated SEQ ID:31711, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13551] Another function of VGAM212 is therefore inhibition of KIAA1198 (Accession XM_032674). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1198. MGC12538 (Accession NM_032746) is another VGAM212 host target gene. MGC12538 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC12538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12538 BINDING SITE, designated SEQ ID:26483, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13552] Another function of VGAM212 is therefore inhibition of

MGC12538 (Accession NM_032746). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12538. MGC15854 (Accession NM_145029) is another VGAM212 host target gene. MGC15854 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC15854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15854 BINDING SITE, designated SEQ ID:29645, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13553] Another function of VGAM212 is therefore inhibition of MGC15854 (Accession NM_145029). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15854. MGC2541 (Accession NM_080670) is another VGAM212 host target gene. MGC2541 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2541, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of MGC2541 BINDING SITE, designated SEQ ID:27966, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13554] Another function of VGAM212 is therefore inhibition of MGC2541 (Accession NM_080670). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2541. MGC4707 (Accession NM_024113) is another VGAM212 host target gene. MGC4707 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4707, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4707 BINDING SITE, designated SEQ ID:23563, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13555] Another function of VGAM212 is therefore inhibition of MGC4707 (Accession NM_024113). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4707. Polymerase (DNA directed), Mu (POLM, Acces-

sion XM_165867) is another VGAM212 host target gene. POLM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POLM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLM BINDING SITE, designated SEQ ID:43786, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13556] Another function of VGAM212 is therefore inhibition of Polymerase (DNA directed), Mu (POLM, Accession XM_165867). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLM. Scavenger Receptor Cysteine Rich Domain Containing, Group B (4 domains) (SRCRB4D, Accession NM_080744) is another VGAM212 host target gene. SRCRB4D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SRCRB4D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRCRB4D BINDING SITE, designated SEQ ID:28031, to the nucleotide sequence of

VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13557] Another function of VGAM212 is therefore inhibition of Scavenger Receptor Cysteine Rich Domain Containing, Group B (4 domains) (SRCRB4D, Accession NM_080744). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRCRB4D. LOC126669 (Accession XM_060121) is another VGAM212 host target gene. LOC126669 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126669 BINDING SITE, designated SEQ ID:37160, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13558] Another function of VGAM212 is therefore inhibition of LOC126669 (Accession XM_060121). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126669. LOC131000 (Accession XM_067145) is an-

other VGAM212 host target gene. LOC131000 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC131000, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131000 BINDING SITE, designated SEQ ID:37349, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13559] Another function of VGAM212 is therefore inhibition of LOC131000 (Accession XM_067145). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131000. LOC147639 (Accession XM_085822) is another VGAM212 host target gene. LOC147639 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147639, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147639 BINDING SITE, designated SEQ ID:38346, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13560] Another function of VGAM212 is therefore inhibition of LOC147639 (Accession XM_085822). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147639. LOC148189 (Accession XM_086087) is another VGAM212 host target gene. LOC148189 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148189 BINDING SITE, designated SEQ ID:38487, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13561] Another function of VGAM212 is therefore inhibition of LOC148189 (Accession XM_086087). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148189. LOC151124 (Accession XM_098006) is another VGAM212 host target gene. LOC151124 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151124, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151124 BINDING SITE, designated SEQ ID:41301, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13562] Another function of VGAM212 is therefore inhibition of LOC151124 (Accession XM_098006). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151124. LOC157381 (Accession XM_098754) is another VGAM212 host target gene. LOC157381 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157381, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157381 BINDING SITE, designated SEQ ID:41789, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13563] Another function of VGAM212 is therefore inhibition of LOC157381 (Accession XM_098754). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC157381. LOC158450 (Accession XM_088580) is another VGAM212 host target gene. LOC158450 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158450 BINDING SITE, designated SEQ ID:39842, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13564] Another function of VGAM212 is therefore inhibition of LOC158450 (Accession XM_088580). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158450. LOC158504 (Accession XM_088591) is another VGAM212 host target gene. LOC158504 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158504, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158504 BINDING SITE, designated SEQ ID:39853, to the nucleotide sequence of VGAM212 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2923.

[13565] Another function of VGAM212 is therefore inhibition of LOC158504 (Accession XM_088591). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158504. LOC199923 (Accession XM_114057) is another VGAM212 host target gene. LOC199923 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199923 BINDING SITE, designated SEQ ID:42668, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13566] Another function of VGAM212 is therefore inhibition of LOC199923 (Accession XM_114057). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199923. LOC90246 (Accession XM_030283) is another VGAM212 host target gene. LOC90246 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90246, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90246 BINDING SITE, designated SEQ ID:31004, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13567] Another function of VGAM212 is therefore inhibition of LOC90246 (Accession XM_030283). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90246. LOC91450 (Accession XM_038515) is another VGAM212 host target gene. LOC91450 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91450 BINDING SITE, designated SEQ ID:32855, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:2923.

[13568] Another function of VGAM212 is therefore inhibition of LOC91450 (Accession XM_038515). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC91450. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 213 (VGAM213) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13569] VGAM213 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM213 was detected is described hereinabove with reference to Figs. 1–8.

[13570] VGAM213 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Simian Virus 40. VGAM213 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13571] VGAM213 gene encodes a VGAM213 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM213 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM213 precursor RNA is designated SEQ

ID:199, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:199 is located at position 4571 relative to the genome of Simian Virus 40.

[13572] VGAM213 precursor RNA folds onto itself, forming VGAM213 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13573] An enzyme complex designated DICER COMPLEX, `dices` the VGAM213 folded precursor RNA into VGAM213 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of VGAM213 RNA is designated SEQ ID:2924, and is provided hereinbelow with reference to the sequence

listing part.

[13574] VGAM213 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM213 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM213 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13575] VGAM213 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM213 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM213 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM213 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM213 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13576] The complementary binding of VGAM213 RNA, herein designated VGAM RNA, to host target binding sites on VGAM213 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM213 host target RNA into VGAM213 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13577] It is appreciated that VGAM213 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM213 host target genes. The mRNA of each one of this plurality of VGAM213 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM213 RNA, herein designated VGAM

RNA, and which when bound by VGAM213 RNA causes inhibition of translation of respective one or more VGAM213 host target proteins.

[13578] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM213 gene, herein designated VGAM GENE, on one or more VGAM213 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[13579] It is yet further appreciated that a function of VGAM213 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM213 include diagnosis, prevention and treatment of viral infection by Simian Virus 40. Specific functions, and accordingly utilities, of VGAM213 correlate with, and may be deduced from, the identity of the host target genes which VGAM213 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13580] Nucleotide sequences of the VGAM213 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM213 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM213 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM213 are further described hereinbelow with reference to Table 1.

[13581] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM213 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM213 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13582] As mentioned hereinabove with reference to Fig. 1, a function of VGAM213 gene, herein designated VGAM is

inhibition of expression of VGAM213 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM213 correlate with, and may be deduced from, the identity of the target genes which VGAM213 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13583] KIAA1229 (Accession XM_030665) is a VGAM213 host target gene. KIAA1229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1229 BINDING SITE, designated SEQ ID:31098, to the nucleotide sequence of VGAM213 RNA, herein designated VGAM RNA, also designated SEQ ID:2924.

[13584] A function of VGAM213 is therefore inhibition of KIAA1229 (Accession XM_030665). Accordingly, utilities of VGAM213 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1229. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 214 (VGAM214) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13585] VGAM214 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM214 was detected is described hereinabove with reference to Figs. 1–8.

[13586] VGAM214 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Autographa Californica Nucleopolyhedrovirus. VGAM214 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13587] VGAM214 gene encodes a VGAM214 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM214 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM214 precursor RNA is designated SEQ ID:200, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:200 is located at position 124772 relative to the genome of Autographa Californica Nucleopolyhedrovirus.

[13588] VGAM214 precursor RNA folds onto itself, forming VGAM214 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13589] An enzyme complex designated DICER COMPLEX, `dices` the VGAM214 folded precursor RNA into VGAM214 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM214 RNA is designated SEQ ID:2925, and is provided hereinbelow with reference to the sequence listing part.

[13590] VGAM214 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM214 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM214 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13591] VGAM214 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM214 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM214 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM214 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM214 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[13592] The complementary binding of VGAM214 RNA, herein designated VGAM RNA, to host target binding sites on VGAM214 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM214 host target RNA into VGAM214 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13593] It is appreciated that VGAM214 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM214 host target genes. The mRNA of each one of this plurality of VGAM214 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM214 RNA, herein designated VGAM RNA, and which when bound by VGAM214 RNA causes inhibition of translation of respective one or more VGAM214 host target proteins.

[13594] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM214 gene, herein designated VGAM GENE, on one or more VGAM214 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[13595] It is yet further appreciated that a function of VGAM214 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM214 include diagnosis, prevention and treatment of viral infection by Autographa Californica Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM214 correlate with, and may be deduced

from, the identity of the host target genes which VGAM214 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13596] Nucleotide sequences of the VGAM214 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM214 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM214 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM214 are further described hereinbelow with reference to Table 1.

[13597] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM214 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM214 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13598] As mentioned hereinabove with reference to Fig. 1, a function of VGAM214 gene, herein designated VGAM is inhibition of expression of VGAM214 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM214 correlate with, and may be deduced from, the identity of the target genes which VGAM214

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13599] Roundabout, Axon Guidance Receptor, Homolog 1 (Drosophila) (ROBO1, Accession NM_133631) is a VGAM214 host target gene. ROBO1 BINDING SITE1 and ROBO1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ROBO1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROBO1 BINDING SITE1 and ROBO1 BINDING SITE2, designated SEQ ID:28583 and SEQ ID:8848 respectively, to the nucleotide sequence of VGAM214 RNA, herein designated VGAM RNA, also designated SEQ ID:2925.

[13600] A function of VGAM214 is therefore inhibition of Roundabout, Axon Guidance Receptor, Homolog 1 (Drosophila) (ROBO1, Accession NM_133631), a gene which is an axon guidance receptor. Accordingly, utilities of VGAM214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROBO1. The function of ROBO1 and its association with various diseases and clinical conditions, has been established by previous studies,

as described hereinabove with reference to VGAM37.LOC92568 (Accession XM_045852) is another VGAM214 host target gene. LOC92568 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92568, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92568 BINDING SITE, designated SEQ ID:34576, to the nucleotide sequence of VGAM214 RNA, herein designated VGAM RNA, also designated SEQ ID:2925.

[13601] Another function of VGAM214 is therefore inhibition of LOC92568 (Accession XM_045852). Accordingly, utilities of VGAM214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92568. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 215 (VGAM215) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13602] VGAM215 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM215 was detected is described hereinabove with reference to Figs. 1–8.

[13603] VGAM215 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Autographa Californica Nucleopolyhedrovirus. VGAM215 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13604] VGAM215 gene encodes a VGAM215 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM215 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM215 precursor RNA is designated SEQ ID:201, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:201 is located at position 123142 relative to the genome of Autographa Californica Nucleopolyhedrovirus.

[13605] VGAM215 precursor RNA folds onto itself, forming VGAM215 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13606] An enzyme complex designated DICER COMPLEX, `dices` the VGAM215 folded precursor RNA into VGAM215 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM215 RNA is designated SEQ ID:2926, and is provided hereinbelow with reference to the sequence listing part.

[13607] VGAM215 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM215 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM215 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13608] VGAM215 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM215 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM215 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM215 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM215 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13609] The complementary binding of VGAM215 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM215 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM215 host target RNA into VGAM215 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13610] It is appreciated that VGAM215 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM215 host target genes. The mRNA of each one of this plurality of VGAM215 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM215 RNA, herein designated VGAM RNA, and which when bound by VGAM215 RNA causes inhibition of translation of respective one or more VGAM215 host target proteins.

[13611] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM215 gene, herein designated VGAM GENE, on one or more VGAM215 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[13612] It is yet further appreciated that a function of VGAM215 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM215 include diagnosis, prevention and treatment of viral infection by Autographa Californica Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM215 correlate with, and may be deduced from, the identity of the host target genes which VGAM215 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13613] Nucleotide sequences of the VGAM215 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM215 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM215 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM215 are further described hereinbelow with reference to Table 1.

[13614] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM215 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM215 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13615] As mentioned hereinabove with reference to Fig. 1, a function of VGAM215 gene, herein designated VGAM is inhibition of expression of VGAM215 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM215 correlate with, and may be deduced from, the identity of the target genes which VGAM215 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13616] HLA-B Associated Transcript 1 (BAT1, Accession NM_080598) is a VGAM215 host target gene. BAT1 BINDING SITE1 and BAT1 BINDING SITE2 are HOST TARGET

binding sites found in untranslated regions of mRNA encoded by BAT1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAT1 BINDING SITE1 and BAT1 BINDING SITE2, designated SEQ ID:27907 and SEQ ID:11014 respectively, to the nucleotide sequence of VGAM215 RNA, herein designated VGAM RNA, also designated SEQ ID:2926.

[13617] A function of VGAM215 is therefore inhibition of HLA-B Associated Transcript 1 (BAT1, Accession NM_080598), a gene which associates with the major histocompatibility complex, a negative regulator of inflammation. Accordingly, utilities of VGAM215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAT1. The function of BAT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. Ubiquitin-conjugating Enzyme E2L 3 (UBE2L3, Accession NM_003347) is another VGAM215 host target gene. UBE2L3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE2L3, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2L3 BINDING SITE, designated SEQ ID:9355, to the nucleotide sequence of VGAM215 RNA, herein designated VGAM RNA, also designated SEQ ID:2926.

[13618] Another function of VGAM215 is therefore inhibition of Ubiquitin-conjugating Enzyme E2L 3 (UBE2L3, Accession NM_003347), a gene which catalyzes the covalent attachment of ubiquitin to other proteins. Accordingly, utilities of VGAM215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2L3. The function of UBE2L3 has been established by previous studies. Shimura et al. (2001) hypothesized that alpha-synuclein (OMIM Ref. No. 163890) and parkin (OMIM Ref. No. 602544) interact functionally, namely, that parkin ubiquitinates alpha-synuclein normally and that this process is altered in autosomal recessive Parkinson disease (OMIM Ref. No. 600116). Shimura et al. (2001) identified a protein complex in normal human brain that includes parkin as the E3 ubiquitin ligase, UBCH7 as its associated E2 ubiquitin-conjugating enzyme, and a novel 22-kD glycosylated form of alpha-synuclein (alpha-Sp22)

as its substrate. In contrast to normal parkin, mutant parkin associated with autosomal recessive Parkinson disease failed to bind alpha-Syn22. In an in vitro ubiquitination assay, alpha-Syn22 was modified by normal, but not mutant, parkin into polyubiquitinated, high molecular weight species. Accordingly, alpha-Syn22 accumulated in a nonubiquitinated form in parkin-deficient Parkinson disease brains. Shimura et al. (2001) concluded that alpha-Syn22 is a substrate for parkin's ubiquitin ligase activity in normal human brain and that loss of parkin function causes pathologic accumulation of alpha-Syn22. These findings demonstrated a critical biochemical reaction between the 2 Parkinson disease-linked gene products and suggested that this reaction underlies the accumulation of ubiquitinated alpha-synuclein in conventional Parkinson disease. By RT-PCR, Moynihan et al. (1998) determined that UBE2L3 is expressed as 4 mRNAs that differ in the length of the 3-prime untranslated region (UTR). Sequence comparisons revealed that the human and mouse UBE2L3 cDNAs share 97% DNA sequence identity in the coding region and 93% identity for 287 nucleotides extending into the 3-prime UTR. The predicted mouse and human UBE2L3 proteins are identical.

- [13619] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [13620] Moynihan, T. P.; Cole, C. G.; Dunham, I.; O'Neil, L.; Markham, A. F.; Robinson, P. A. : Fine-mapping, genomic organization, and transcript analysis of the human ubiquitin-conjugating enzyme gene UBE2L3. *Genomics* 51: 124-127, 1998. ; and
- [13621] Shimura, H.; Schlossmacher, M. G.; Hattori, N.; Frosch, M. P.; Trockenbacher, A.; Schneider, R.; Mizuno, Y.; Kosik, K. S.; Selkoe, D. J. : Ubiquitination of a new form of alpha-synuclei.
- [13622] Further studies establishing the function and utilities of UBE2L3 are found in John Hopkins OMIM database record ID 603721, and in cited publications numbered 5363, 834 and 6191 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0391 (Accession NM_014672) is another VGAM215 host target gene. KIAA0391 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0391 BINDING SITE, designated SEQ ID:16139, to the nucleotide sequence of VGAM215 RNA, herein designated VGAM RNA, also designated SEQ ID:2926.

[13623] Another function of VGAM215 is therefore inhibition of KIAA0391 (Accession NM_014672). Accordingly, utilities of VGAM215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0391. RAB20, Member RAS Oncogene Family (RAB20, Accession NM_017817) is another VGAM215 host target gene. RAB20 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RAB20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB20 BINDING SITE, designated SEQ ID:19463, to the nucleotide sequence of VGAM215 RNA, herein designated VGAM RNA, also designated SEQ ID:2926.

[13624] Another function of VGAM215 is therefore inhibition of RAB20, Member RAS Oncogene Family (RAB20, Accession NM_017817). Accordingly, utilities of VGAM215 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with RAB20. Solute Carrier Family 12, (potassium–chloride transporter) Member 5 (SLC12A5, Accession NM_020708) is another VGAM215 host target gene. SLC12A5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC12A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC12A5 BINDING SITE, designated SEQ ID:21855, to the nucleotide sequence of VGAM215 RNA, herein designated VGAM RNA, also designated SEQ ID:2926.

[13625] Another function of VGAM215 is therefore inhibition of Solute Carrier Family 12, (potassium–chloride transporter) Member 5 (SLC12A5, Accession NM_020708). Accordingly, utilities of VGAM215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC12A5. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 216 (VGAM216) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[13626] VGAM216 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM216 was detected is described hereinabove with reference to Figs. 1–8.

[13627] VGAM216 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Leukosis Virus. VGAM216 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13628] VGAM216 gene encodes a VGAM216 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM216 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM216 precursor RNA is designated SEQ ID:202, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:202 is located at position 1866 relative to the genome of Avian Leukosis Virus.

[13629] VGAM216 precursor RNA folds onto itself, forming VGAM216 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[13630] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM216 folded precursor RNA into VGAM216 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 75%) nucleotide se-
quence of VGAM216 RNA is designated SEQ ID:2927, and
is provided hereinbelow with reference to the sequence
listing part.

[13631] VGAM216 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM216 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM216 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[13632] VGAM216 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM216 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM216 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM216 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM216 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[13633] The complementary binding of VGAM216 RNA, herein designated VGAM RNA, to host target binding sites on VGAM216 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM216 host target RNA into VGAM216 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13634] It is appreciated that VGAM216 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM216 host target genes. The mRNA of each one of this plurality of VGAM216 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM216 RNA, herein designated VGAM RNA, and which when bound by VGAM216 RNA causes inhibition of translation of respective one or more VGAM216 host target proteins.

[13635] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM216 gene, herein designated VGAM GENE, on one or

more VGAM216 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[13636] It is yet further appreciated that a function of VGAM216 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM216 include diagnosis, prevention and treatment of viral infection by Avian Leukosis Virus. Specific functions, and accordingly utilities, of VGAM216 correlate with, and may be deduced from, the identity of the host target genes which VGAM216 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [13637] Nucleotide sequences of the VGAM216 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM216 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM216 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM216 are further described hereinbelow with reference to Table 1.
- [13638] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM216 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM216 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [13639] As mentioned hereinabove with reference to Fig. 1, a function of VGAM216 gene, herein designated VGAM is inhibition of expression of VGAM216 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM216 correlate with, and may be deduced from, the identity of the target genes which VGAM216 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [13640] Egl Nine Homolog 1 (C. elegans) (EGLN1, Accession

NM_022051) is a VGAM216 host target gene. EGLN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EGLN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGLN1 BINDING SITE, designated SEQ ID:22584, to the nucleotide sequence of VGAM216 RNA, herein designated VGAM RNA, also designated SEQ ID:2927.

[13641] A function of VGAM216 is therefore inhibition of Egl Nine Homolog 1 (*C. elegans*) (EGLN1, Accession NM_022051), a gene which is expressed in the cytoplasm of arterial smooth muscle cells. Accordingly, utilities of VGAM216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGLN1. The function of EGLN1 has been established by previous studies. HIF is a transcriptional complex that plays a central role in mammalian oxygen homeostasis. Posttranslational modification by prolyl hydroxylation is a key regulatory event that targets HIF- α (HIF1; 603348) subunits for proteasomal destruction via the von Hippel-Lindau (VHL; 193300) ubiquitylation complex. Epstein et al. (2001) defined a conserved HIF-VHL-prolyl hydroxylase pathway in

C. elegans and identified Egl9 as a dioxygenase that regulates HIF by prolyl hydroxylation. In mammalian cells, they showed that the HIF-prolyl hydroxylases are represented by 3 proteins with a conserved 2-histidine-1-carboxylate iron coordination motif at the catalytic site. The genes encoding these proteins were cloned and termed PHD1 (OMIM Ref. No. 606424), PHD2, and PHD3 (OMIM Ref. No. 606426) by the authors. Direct modulation of recombinant enzyme activity by graded hypoxia, iron chelation, and cobaltous ions mirrored the characteristics of HIF induction in vivo, fulfilling requirements for these enzymes being oxygen sensors that regulate HIF. In cultured mammalian cells, Bruick and McKnight (2001) found that the inappropriate accumulation of HIF caused by forced expression of the HIF1-alpha (OMIM Ref. No. 603348) subunit under normoxic conditions was attenuated by coexpression of HPH. Suppression of HPH in cultured *Drosophila melanogaster* cells by RNA interference resulted in elevated expression of the hypoxia-inducible gene LDH (see OMIM Ref. No. 150000) under normoxic conditions. Bruick and McKnight (2001) concluded that HPH is an essential component of the pathway through which cells sense oxygen.

[13642] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13643] Bruick, R. K.; McKnight, S. L. : A conserved family of prolyl-4-hydroxylases that modify HIF. Science 294: 1337-1340, 2001. ; and

[13644] Epstein, A. C. R.; Gleadle, J. M.; McNeill, L. A.; Hewitson, K. S.; O'Rourke, J.; Mole, D. R.; Mukherji, M.; Metzen, E.; Wilson, M. I.; Dhanda, A.; Tian, Y.-M.; Masson, N.; Hamilton.

[13645] Further studies establishing the function and utilities of EGLN1 are found in John Hopkins OMIM database record ID 606425, and in cited publications numbered 454 and 4545 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 2 (RPS6KA2, Accession NM_021135) is another VGAM216 host target gene.

RPS6KA2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RPS6KA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPS6KA2 BINDING SITE, designated SEQ ID:22105, to the nucleotide sequence of VGAM216 RNA,

herein designated VGAM RNA, also designated SEQ ID:2927.

[13646] Another function of VGAM216 is therefore inhibition of Ribosomal Protein S6 Kinase, 90kDa, Polypeptide 2 (RPS6KA2, Accession NM_021135), a gene which phosphorylates a wide range of substrates including ribosomal protein s6. Accordingly, utilities of VGAM216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPS6KA2. The function of RPS6KA2 has been established by previous studies. Serine/threonine protein kinases in the ribosomal S6 kinase (RSK) family have been implicated as signaling intermediates in the cellular response to several growth factors. Moller et al. (1994) described the cloning and characterization of 3 genes encoding 3 isoforms of ribosomal protein S6 kinase, which they called HU1 (RPS6KA1; 601684), HU2 (RPS6KA2), and HU3 (RPS6KA3; 300075). The partial HU2 cDNA (GenBank L07598) encodes a predicted protein containing 2 distinct consensus ATP-binding site sequences. Northern blot and RNase protection analyses detected major 7.5-kb and minor 3.5-kb HU2 transcripts in fibroblasts, skeletal muscle, lymphocytes, and placenta. Zhao et al. (1995) cloned a full-length cDNA encoding the

RPS6KA2 isoform of ribosomal protein S6 kinase, which they designated RSK3. The deduced 733–amino acid RSK3 protein has 84% and 75% sequence identity with RSK2 (RPS6KA3) and RSK1 (RPS6KA1), respectively. RSK3 has a unique N–terminal sequence which contains a putative bipartite nuclear localization signal. Immunoblot analysis of human cell lysates detected an 83–kD RSK protein. The authors demonstrated serum–stimulated nuclear translocation of endogenous RSK3 in HeLa cells. RSK3 exhibited growth–stimulated autophosphorylation and kinase activity; however, its relative activity toward several known RSK substrates differed from the activities of other RSKs. Unlike RSK1, RSK3 was not activated by ERK2 (PRKM1; 176948) in vitro. Northern blot analysis detected a single 6.5–kb RSK3 transcript in all tissues examined, with the highest expression in lung and skeletal muscle.

[13647] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13648] Moller, D. E.; Xia, C. H.; Tang, W.; Zhu, A. X.; Jakubowski, M. : Human rsk isoforms: cloning and characterization of tissue–specific expression. *Am. J. Physiol.* 266: C351–C359, 1994. ; and

[13649] Zhao, Y.; Bjorbaek, C.; Weremowicz, S.; Morton, C. C.; Moller, D. E. : RSK3 encodes a novel pp90rsk isoform with a unique N-terminal sequence: growth factor-stimulated kinase function and n.

[13650] Further studies establishing the function and utilities of RPS6KA2 are found in John Hopkins OMIM database record ID 601685, and in cited publications numbered 622 and 9211-9212 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glucocorticoid Modulatory Element Binding Protein 2 (GMEB2, Accession NM_012384) is another VGAM216 host target gene. GMEB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GMEB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GMEB2 BINDING SITE, designated SEQ ID:14740, to the nucleotide sequence of VGAM216 RNA, herein designated VGAM RNA, also designated SEQ ID:2927.

[13651] Another function of VGAM216 is therefore inhibition of Glucocorticoid Modulatory Element Binding Protein 2 (GMEB2, Accession NM_012384). Accordingly, utilities of

VGAM216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMEB2. HS6ST (Accession XM_030529) is another VGAM216 host target gene. HS6ST BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HS6ST, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HS6ST BINDING SITE, designated SEQ ID:31072, to the nucleotide sequence of VGAM216 RNA, herein designated VGAM RNA, also designated SEQ ID:2927.

[13652] Another function of VGAM216 is therefore inhibition of HS6ST (Accession XM_030529). Accordingly, utilities of VGAM216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HS6ST. Heparan Sulfate 6-O-sulfotransferase 1 (HS6ST1, Accession NM_004807) is another VGAM216 host target gene. HS6ST1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HS6ST1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of HS6ST1 BINDING SITE, designated SEQ ID:11230, to the nucleotide sequence of VGAM216 RNA, herein designated VGAM RNA, also designated SEQ ID:2927.

[13653] Another function of VGAM216 is therefore inhibition of Heparan Sulfate 6-O-sulfotransferase 1 (HS6ST1, Accession NM_004807). Accordingly, utilities of VGAM216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HS6ST1. KIAA0339 (Accession XM_049380) is another VGAM216 host target gene. KIAA0339 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0339, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0339 BINDING SITE, designated SEQ ID:35404, to the nucleotide sequence of VGAM216 RNA, herein designated VGAM RNA, also designated SEQ ID:2927.

[13654] Another function of VGAM216 is therefore inhibition of KIAA0339 (Accession XM_049380). Accordingly, utilities of VGAM216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0339. LOC115051 (Accession XM_010647) is another VGAM216 host target gene. LOC115051 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115051, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115051 BINDING SITE, designated SEQ ID:30160, to the nucleotide sequence of VGAM216 RNA, herein designated VGAM RNA, also designated SEQ ID:2927.

[13655] Another function of VGAM216 is therefore inhibition of LOC115051 (Accession XM_010647). Accordingly, utilities of VGAM216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115051. LOC123096 (Accession XM_058679) is another VGAM216 host target gene. LOC123096 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC123096, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123096 BINDING SITE, designated SEQ ID:36721, to the nucleotide sequence of VGAM216 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2927.

[13656] Another function of VGAM216 is therefore inhibition of LOC123096 (Accession XM_058679). Accordingly, utilities of VGAM216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123096. LOC220549 (Accession XM_167521) is another VGAM216 host target gene. LOC220549 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220549 BINDING SITE, designated SEQ ID:44652, to the nucleotide sequence of VGAM216 RNA, herein designated VGAM RNA, also designated SEQ ID:2927.

[13657] Another function of VGAM216 is therefore inhibition of LOC220549 (Accession XM_167521). Accordingly, utilities of VGAM216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220549. LOC253100 (Accession XM_174623) is another VGAM216 host target gene. LOC253100 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253100, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253100 BINDING SITE, designated SEQ ID:46600, to the nucleotide sequence of VGAM216 RNA, herein designated VGAM RNA, also designated SEQ ID:2927.

[13658] Another function of VGAM216 is therefore inhibition of LOC253100 (Accession XM_174623). Accordingly, utilities of VGAM216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253100. LOC51054 (Accession NM_015899) is another VGAM216 host target gene. LOC51054 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51054 BINDING SITE, designated SEQ ID:18042, to the nucleotide sequence of VGAM216 RNA, herein designated VGAM RNA, also designated SEQ ID:2927.

[13659] Another function of VGAM216 is therefore inhibition of LOC51054 (Accession NM_015899). Accordingly, utilities of VGAM216 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC51054. LOC84661 (Accession NM_032574) is another VGAM216 host target gene. LOC84661 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC84661, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC84661 BINDING SITE, designated SEQ ID:26303, to the nucleotide sequence of VGAM216 RNA, herein designated VGAM RNA, also designated SEQ ID:2927.

[13660] Another function of VGAM216 is therefore inhibition of LOC84661 (Accession NM_032574). Accordingly, utilities of VGAM216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC84661. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 217 (VGAM217) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13661] VGAM217 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM217 was detected is described hereinabove with reference to Figs. 1–8.

[13662] VGAM217 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Leukosis Virus. VGAM217 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13663] VGAM217 gene encodes a VGAM217 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM217 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM217 precursor RNA is designated SEQ ID:203, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:203 is located at position 3402 relative to the genome of Avian Leukosis Virus.

[13664] VGAM217 precursor RNA folds onto itself, forming VGAM217 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13665] An enzyme complex designated DICER COMPLEX, `dices` the VGAM217 folded precursor RNA into VGAM217 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM217 RNA is designated SEQ ID:2928, and is provided hereinbelow with reference to the sequence listing part.

[13666] VGAM217 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM217 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM217 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13667] VGAM217 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM217 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM217 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM217 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM217 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13668] The complementary binding of VGAM217 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM217 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM217 host target RNA into VGAM217 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13669] It is appreciated that VGAM217 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM217 host target genes. The mRNA of each one of this plurality of VGAM217 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM217 RNA, herein designated VGAM RNA, and which when bound by VGAM217 RNA causes inhibition of translation of respective one or more VGAM217 host target proteins.

[13670] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM217 gene, herein designated VGAM GENE, on one or more VGAM217 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[13671] It is yet further appreciated that a function of VGAM217 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of viral infection by Avian Leukosis Virus. Specific functions, and accordingly utilities, of VGAM217 correlate with, and may be deduced from, the identity of the host target genes which VGAM217 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13672] Nucleotide sequences of the VGAM217 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

5' duced 5' VGAM217 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM217 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM217 are further described hereinbelow with reference to Table 1.

[13673] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM217 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM217 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13674] As mentioned hereinabove with reference to Fig. 1, a function of VGAM217 gene, herein designated VGAM is inhibition of expression of VGAM217 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM217 correlate with, and may be deduced from, the identity of the target genes which VGAM217 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13675] Activin A Receptor, Type I (ACVR1, Accession NM_001105) is a VGAM217 host target gene. ACVR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by ACVR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACVR1 BINDING SITE, designated SEQ ID:6761, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13676] A function of VGAM217 is therefore inhibition of Activin A Receptor, Type I (ACVR1, Accession NM_001105), a gene which Activin receptor-like kinase; similar to activin, TGF-beta, and C. elegans daf-1 receptors. Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACVR1. The function of ACVR1 has been established by previous studies. See ACVRLK1 (OMIM Ref. No. 601284). Although activins were discovered by virtue of their capacity to stimulate the production of follicle-stimulating hormone (FSH; 136530) by the pituitary gland and inhibins were initially characterized as FSH inhibitors, activins and inhibins are dimeric proteins that share a common subunit. There are 3 activins (A, B, and A-B), comprising different combinations of 2 closely related beta subunits (beta-A/beta-A; beta-B/beta-B; and beta-A/beta-B, re-

spectively) and 2 inhibins (A and B), consisting of 1 beta-subunit and an inhibin-specific alpha subunit (alpha/beta-A and alpha/beta-B). Activins impinge on a much broader spectrum of cells than do inhibins; however, in those systems in which both proteins are functional, they have opposing biologic effects. Activins are members of a family of polypeptide growth factors that includes also the transforming growth factors-beta (190180, 190220, 190230), mullerian duct-inhibiting substance, and several bone morphogenetic proteins. Human cDNA clones encoding 4 putative transmembrane ser/thr kinases were identified by ten Dijke et al. (1993). By Southern blot analysis of DNAs from a somatic cell hybrid mapping panel, Roijer et al. (1998) mapped the ACVR1 gene to chromosome 2. By fluorescence in situ hybridization, they regionalized the gene to 2q23-q24.

[13677] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13678] ten Dijke, P.; Ichijo, H.; Franzen, P.; Schulz, P.; Saras, J.; Toyoshima, H.; Heldin, C.-H.; Miyazono, K. : Activin receptor-like kinases: a novel subclass of cell-surface receptors with predicted serine/threonine kinase activity.

Oncogene 8: 2879–2887, 1993. ; and

[13679] Roijer, E.; Miyazono, K.; Astrom, A.–K.; Geurts van Kessel, A.; ten Dijke, P.; Stenman, G. : Chromosomal localization of three human genes encoding members of the TGF–beta superfamily of.

[13680] Further studies establishing the function and utilities of ACVR1 are found in John Hopkins OMIM database record ID 102576, and in cited publications numbered 4267–4271 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Dihydropyrimidinase–like 2 (DPYSL2, Accession NM_001386) is another VGAM217 host target gene. DPYSL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DPYSL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DPYSL2 BINDING SITE, designated SEQ ID:7062, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13681] Another function of VGAM217 is therefore inhibition of Dihydropyrimidinase–like 2 (DPYSL2, Accession

NM_001386), a gene which is a member of the dihydropyrimidinase family. Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPYSL2. The function of DPYSL2 has been established by previous studies.

Hamajima et al. (1996) isolated a human cDNA encoding dihydropyrimidinase-like 2 (OMIM Ref. No. DPYSL2), called DRP2 by them, from a fetal brain cDNA library (see OMIM Ref. No. 222748). The DPYSL2 protein has 572 amino acids. Northern blot analysis detected a 4.9-kb DPYSL2 transcript in all tissues examined except liver. Hamajima et al. (1996) noted that 3 ESTs mapped to 8p21 by Koyama et al. (1995) correspond to a portion of the coding region of DPYSL2.

[13682] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13683] Hamajima, N.; Matsuda, K.; Sakata, S.; Tamaki, N.; Sasaki, M.; Nonaka, M. : A novel gene family defined by human dihydropyrimidinase and three related proteins with differential tissue distribution. Gene 180: 157-163, 1996. ; and

[13684] Koyama, K.; Sudo, K.; Nakamura, Y. : Isolation of 115 hu-

man chromosome 8-specific expressed-sequence tags by exon amplification. Genomics 26: 245-253, 1995.

[13685] Further studies establishing the function and utilities of DPYSL2 are found in John Hopkins OMIM database record ID 602463, and in cited publications numbered 327 and 6187 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Forkhead Box F2 (FOXF2, Accession NM_001452) is another VGAM217 host target gene. FOXF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FOXF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXF2 BINDING SITE, designated SEQ ID:7186, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13686] Another function of VGAM217 is therefore inhibition of Forkhead Box F2 (FOXF2, Accession NM_001452), a gene which is a probable transcription activator for a number of lung-specific genes. Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXF2. The func-

tion of FOXF2 has been established by previous studies. The forkhead domain is a 100–amino acid monomeric DNA binding motif originally identified as a region of homology between the *Drosophila* forkhead protein and rat HNF3. Pierrou et al. (1994) identified 7 human genes containing forkhead domains and designated them forkhead related activators (FREAC) 1 through 7. Northern blot analysis revealed that the FREAC2, or FKHL6, gene is expressed as a 2.4–kb mRNA primarily in placenta and adult and fetal lung. Pierrou et al. (1994) determined the DNA binding specificity of FKHL6 through selection of high-affinity binding sites from random sequence oligonucleotides. Hellqvist et al. (1996) reported the sequence of a partial FREAC2 cDNA. The predicted 408–amino acid protein is missing the N-terminal region. Sequence analysis revealed that the FREAC1 (FKHL5; 601089) and FREAC2 proteins are nearly identical within a 112–residue region containing the forkhead domain and adjacent sequences, and within the C-terminal region. Using a reporter gene construct containing in the promoter the FREAC2 binding sequences identified by Pierrou et al. (1994), Hellqvist et al. (1996) demonstrated that both FREAC1 and FREAC2 have C-terminal transcriptional activation domains.

FREAC1/FREAC2 binding sequences are present in the promoters of several lung-specific genes, including CC10 (OMIM Ref. No. 192020) and SPB (SFTPBB; 178640). Both FREAC1 and FREAC2 transactivated an SPB promoter construct. Blixt et al. (1998) reported that the full-length FREAC2 protein contains 444 amino acids.

[13687] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13688] Hellqvist, M.; Mahlapuu, M.; Samuelsson, L.; Enerback, S.; Carlsson, P. : Differential activation of lung-specific genes by two forkhead proteins, FREAC-1 and FREAC-2. J. Biol. Chem. 271: 4482-4490, 1996. ; and

[13689] Pierrou, S.; Hellqvist, M.; Samuelsson, L.; Enerback, S.; Carlsson, P. : Cloning and characterization of seven human forkhead proteins: binding site specificity and DNA bending. EMBO J.

[13690] Further studies establishing the function and utilities of FOXF2 are found in John Hopkins OMIM database record ID 603250, and in cited publications numbered 8656, 9457-945 and 9460 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. MAD, Mothers Against Decapentaplegic Homolog 4

(Drosophila) (MADH4, Accession NM_005359) is another VGAM217 host target gene. MADH4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MADH4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MADH4 BINDING SITE, designated SEQ ID:11829, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13691] Another function of VGAM217 is therefore inhibition of MAD, Mothers Against Decapentaplegic Homolog 4 (Drosophila) (MADH4, Accession NM_005359), a gene which common mediator of signal transduction by $\text{tgf-}\beta$ (transforming growth factor) superfamily; smad4 is the common smad (co-smad). promotes binding of the smad2/smad4/fast-1 complex to dna and provides an activation function required for smad1 or smad2 to stimulate transcription. may act as a tumor suppressor. Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MADH4. The function of MADH4 has been established by previous studies. About 90% of human pan-

creatic carcinomas show allelic loss at 18q. Hahn et al. (1996) reported the identification of a putative tumor suppressor gene on chromosome 18q21.1 that may be a candidate for pancreatic carcinoma. The gene was homozygously deleted in 25 of 84 tumors and mutations were identified as somatic mutations in 6 of 27 carcinomas that lacked deletions. The gene was localized by deletion analysis of xenograft DNA. Markers absent in these samples were used to screen the CEPH mega-YAC library. YACs spanning the minimal deletion region were subcloned as cosmids for sequencing and recovery of cDNAs. A 2,680-bp cDNA was found and shown to code for a predicted 552-amino acid protein. The predicted protein shares blocks of as much as 85% similarity to the *Drosophila* Mad protein and the *Caenorhabditis elegans* sma-2, -3 and -4 proteins. In *Drosophila*, homozygous Mad mutants exhibit a variety of developmental defects. The authors showed that the human gene contains 11 exons. Hahn et al. (1996) designated the gene DPC4 (for homozygously deleted in pancreatic carcinoma, locus 4). This region of chromosome 18q also contains a gene (DCC; 120470) found to be deleted in colorectal cancers. Animal model experiments lend further support to the

function of MADH4. Takaku et al. (1998) inactivated the mouse Dpc4 (Smad4) homolog. The homozygous mutants were embryonic lethal, whereas the heterozygotes showed no abnormality. The investigators then introduced the Dpc4 mutation into the knockout mice for the mouse homolog of the human APC (OMIM Ref. No. 175100) gene, Apc-delta716, a model for human familial adenomatous polyposis. Because both Apc and Dpc4 are located on mouse chromosome 18, they constructed compound heterozygotes carrying both mutations on the same chromosome by meiotic recombination. In such mice, intestinal polyps developed into more malignant tumors than those in the simple Apc-delta716 heterozygotes, showing an extensive stromal cell proliferation, submucosal invasion, cell type heterogeneity, and in vivo transplantability.

Takaku et al. (1998) suggested that mutations in DPC4 play a significant role in the malignant progression of colorectal tumors. Sirard et al. (1998) demonstrated that homozygous Smad4 mutant mice died before embryonic day 7.5. Mutant embryos have reduced size, fail to gastrulate or express a mesodermal marker, and show abnormal visceral endoderm development. Growth retardation of the Smad4-deficient embryos results from reduced cell prolifer-

eration rather than increased apoptosis. Aggregation of mutant Smad4 embryonic stem cells with wildtype tetraploid morulae rescued the gastrulation defect. The results of Sirard et al. (1998) indicated that Smad4 is initially required for the differentiation of the visceral endoderm and that the gastrulation defect in the epiblast is secondary and noncell autonomous. Rescued embryos showed severe anterior truncations, indicating a second important role for Smad4 in anterior patterning during embryogenesis

[13692] It is appreciated that the abovementioned animal model for MADH4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[13693] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13694] Sirard, C.; de la Pompa, J. L.; Elia, A.; Itie, A.; Mirtsos, C.; Cheung, A.; Hahn, S.; Wakeham, A.; Schwartz, L.; Kern, S. E.; Rossant, J.; Mak, T. W. : The tumor suppressor gene Smad4/Dpc4 is required for gastrulation and later for anterior development of the mouse embryo. *Genes Dev.* 12: 107–119, 1998. ; and

[13695] Hahn, S. A.; Schutte, M.; Hoque, T. M. S.; Moskaluk, C. A.; da Costa, L. T.; Rozenblum, E.; Weinstein, C. L.; Fischer, A.; Yeo, C. J.; Hruban, R. H.; Kern, S. E. : DPC4, a candidate tumor s.

[13696] Further studies establishing the function and utilities of MADH4 are found in John Hopkins OMIM database record ID 600993, and in cited publications numbered 7161, 7798, 12349-7817, 10962, 10965-1096 and 7819-7832 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mitogen-activated Protein Kinase 1 (MAPK1, Accession NM_002745) is another VGAM217 host target gene. MAPK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAPK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK1 BINDING SITE, designated SEQ ID:8615, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13697] Another function of VGAM217 is therefore inhibition of Mitogen-activated Protein Kinase 1 (MAPK1, Accession NM_002745), a gene which phosphorylates microtubule-

associated protein-2 (map2). myelin basic protein (mbp), and elk-1; may promote entry in the cell cycle. Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK1. The function of MAPK1 has been established by previous studies. Forcet et al. (2002) showed that in embryonic kidney cells expressing full-length, but not cytoplasmic domain-truncated, DCC (OMIM Ref. No. 120470), NTN1 (OMIM Ref. No. 601614) causes increased transient phosphorylation and activity of ERK1 and ERK2, but not of JNK1 (OMIM Ref. No. 601158), JNK2 (OMIM Ref. No. 602896), or p38 (MAPK14; 600289). This phosphorylation was mediated by MEK1 and/or MEK2. NTN1 also activated the transcription factor ELK1 (OMIM Ref. No. 311040) and serum response element-regulated gene expression. Immunoprecipitation analysis showed interaction of full-length DCC with MEK1/2 in the presence or absence of NTN1. Forcet et al. (2002) showed that activation of Dcc by Ntn1 in rat embryonic day-13 dorsal spinal cord stimulates and is required for the outgrowth of commissural axons and Erk1/2 activation. Immunohistochemical analysis demonstrated expression of activated Erk1/2 in embryonic commissural axons, and this expression was

diminished in Dcc or Ntn1 knockout animals. Forcet et al. (2002) concluded that the MAPK pathway is involved in responses to NTN1 and proposed that ERK activation affects axonal growth by phosphorylation of microtubule-associated proteins and neurofilaments. Stefanovsky et al. (2001) showed that epidermal growth factor (OMIM Ref. No. 131530) induces immediate, ERK1/ERK2-dependent activation of endogenous ribosomal transcription, while inactivation of ERK1/ERK2 causes an equally immediate reversion to the basal transcription level. ERK1/ERK2 was found to phosphorylate the architectural transcription factor UBF (OMIM Ref. No. 600673) at amino acids 117 and 201 within HMG boxes 1 and 2, preventing their interaction with DNA. Mutation of these sites inhibited transcription activation and abrogated the transcriptional response to ERK1/ERK2. Thus, growth factor regulation of ribosomal transcription likely acts by a cyclic modulation of DNA architecture. The data suggested a central role for ribosome biogenesis in growth regulation

[13698] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13701] Further studies establishing the function and utilities of MAPK1 are found in John Hopkins OMIM database record ID 176948, and in cited publications numbered 1529-1532, 10346-1536, 10350, 10354-153 and 3462 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. 5',3'-nucleotidase, Mitochondrial (NT5M, Accession NM_020201) is another VGAM217 host target gene. NT5M BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NT5M, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NT5M BINDING SITE, designated SEQ ID:21436, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2928.

[13702] Another function of VGAM217 is therefore inhibition of 5',3'-nucleotidase, Mitochondrial (NT5M, Accession NM_020201). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NT5M. Protein Tyrosine Phosphatase Type IVA, Member 2 (PTP4A2, Accession NM_003479) is another VGAM217 host target gene. PTP4A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTP4A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTP4A2 BINDING SITE, designated SEQ ID:9550, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13703] Another function of VGAM217 is therefore inhibition of Protein Tyrosine Phosphatase Type IVA, Member 2 (PTP4A2, Accession NM_003479), a gene which is a protein tyrosine phosphatase which has a C-terminal prenylation site. Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with PTP4A2. The function of PTP4A2 has been established by previous studies. The rat Prl1 (phosphatase of regenerating liver-1; 601585) protein is a 20-kD nuclear protein tyrosine phosphatase (OMIM Ref. No. PTPase) that is not homologous to previously characterized dual-specificity PTPases or the monospecific PTPases. Montagna et al. (1995) identified a cDNA encoding a human PRL1-like protein, which they designated OV1. By using an in vitro prenylation screen, Cates et al. (1996) found that human PRL1 and OV1, which they referred to as PTP(CAAX1) and PTP(CAAX2), respectively, are farnesylated in vitro by mammalian farnesyl:protein transferase. Overexpression of these PTPs in epithelial cells caused a transformed phenotype in cultured cells and tumor growth in nude mice. Cates et al. (1996) concluded that PTP(CAAX1) and PTP(CAAX2) represent a novel class of isoprenylated, oncogenic PTPs. Zhao et al. (1996) isolated both cDNA and genomic clones as part of a screen for genes with CTG repeats. Among these were 2 cDNAs, HH13 and HH7-2, that were identical in their coding regions but differed primarily in their 5-prime untranslated regions (UTRs). The predicted 167-amino acid sequence from each was 89% identical to

rat Prl1 but was unrelated to other PTPs except for the active site. The protein contains a large number of basic residues and has a predicted isoelectric point of 8.33. Northern blot analysis using a probe from the common 3-prime UTR of HH13 and HH7-2 identified transcripts of 2 and 4 kb in all human tissues examined. Zeng et al. (1998) identified cDNAs encoding the mouse homolog of human PTP(CAAX2), or PRL2. The predicted human and mouse PRL2 proteins are identical. Zhao et al. (1996) used the HH13 cDNA to identify a YAC that was mapped to 1p35 by fluorescence in situ hybridization. They found a third cDNA (designated HH18) which contains a large deletion in the reading frame and may be a splice variant of either HH13 or HH7-2. Furthermore, a processed pseudogene with 96% sequence identity was found in the BRCA1 (OMIM Ref. No. 113705) region of 17q21.

[13704] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13705] Cates, C. A.; Michael, R. L.; Stayrook, K. R.; Harvey, K. A.; Burke, Y. D.; Randall, S. K.; Crowell, P. L.; Crowell, D. N. : Prenylation of oncogenic human PTP(CAAX) protein tyrosine phosphatases. Cancer Lett. 110: 49-55, 1996. ; and

[13707] Further studies establishing the function and utilities of PTP4A2 are found in John Hopkins OMIM database record ID 601584, and in cited publications numbered 6551–655 and 7174 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Tyrosine Phosphatase, Receptor Type, D (PTPRD, Accession NM_130391) is another VGAM217 host target gene. PTPRD BINDING SITE1 through PTPRD BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRD BINDING SITE1 through PTPRD BINDING SITE4, designated SEQ ID:28178, SEQ ID:28179, SEQ ID:28180 and SEQ ID:8722 respectively, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13708] Another function of VGAM217 is therefore inhibition of

Protein Tyrosine Phosphatase, Receptor Type, D (PTPRD, Accession NM_130391), a gene which plays important roles in regulating hippocampal LTP and learning processes. Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRD. The function of PTPRD has been established by previous studies. Mizuno et al. (1993) isolated a mouse gene that was highly homologous to human protein-tyrosine phosphatase-delta. The cDNA clones were isolated by screening mouse brain cDNA libraries with mouse CD45 protein-tyrosine phosphatase domain probes under reduced stringency. Northern blot analysis demonstrated expression of 3 mRNA species in brain, kidney, and heart. In situ hybridization of brain samples revealed that the mRNA was present in hippocampus, thalamic reticular nucleus, and piriform cortex. Although this murine mRNA was not detected in lymphoid tissues, all of the pre-B cell lines tested and 1 of 3 B-cell lines tested expressed mRNA, whereas antibody-producing B-cell hybridomas and T-cell and macrophage lines did not. Testing a panel of recombinant inbred strains, Mizuno et al. (1993) mapped the gene to mouse chromosome 4 in tight linkage to the 'brown' (b) locus.

They found that the mouse gene was closely homologous to the human PTPRD gene. A high degree of structural similarity had been demonstrated between LAR (PTPRF; 179590) in the human and human PTPRD. This raised the possibility that they are allelic forms or that PTPRD and LAR are related but distinct gene products. The findings of Mizuno et al. (1993) in the mouse supported the latter possibility. First, the LAR gene is expressed predominantly in cells of epithelial origin and T cells but not in B cells, whereas expression of murine PTP-delta is restricted to brain, kidney, heart, and some B-cell lines. Second, the chromosomal localization of LAR to human 1p34-p32 is different from the location on mouse chromosome 4, close to the b locus, which corresponds to human 9q. It is noteworthy that the Ptp rf gene maps to mouse chromosome 4 (Schaapveld et al., 1995). Animal model experiments lend further support to the function of PTPRD. Ptp rd is a receptor-type protein-tyrosine phosphatase expressed in the specialized regions of the brain, including the hippocampal CA2 and CA3, in B lymphocytes, and in the thymic medulla. To elucidate the physiologic roles of Ptp rd, Uetani et al. (2000) produced Ptp rd-deficient mice by gene targeting. They found that Ptp rd-deficient mice

were semilethal due to insufficient food intake. The mice also exhibited learning impairment in the Morris water maze, reinforced T-maze, and radial arm maze tasks. Although the histology of the hippocampus appeared normal, the magnitudes of long-term potentiation (LTP) induced at hippocampal CA1 and CA3 synapses were significantly enhanced in *Ptprd*-deficient mice, with augmented paired-pulse facilitation in the CA1 region. Uetani et al. (2000) concluded that *Ptprd* plays important roles in regulating hippocampal LTP and learning processes, and that hippocampal LTP does not necessarily positively correlate with spatial learning ability. They stated that *Ptprd* is an important regulator of synaptic plasticity and discussed the role of *Ptprd* in learning and memory

[13709] It is appreciated that the abovementioned animal model for PTPRD is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[13710] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13711] Schaapveld, R. Q. J.; van den Maagdenberg, A. M. J. M.; Schepens, J. T. G.; Olde Weghuis, D.; Geurts van Kessel,

A.; Wieringa, B.; Hendriks, W. J. A. J. : The mouse gene Pt-prf encoding the leukocyte common antigen-related molecule LAR: cloning, characterization, and chromosomal localization. Genomics 27: 124-130, 1995. ; and

[13712] Uetani, N.; Kato, K.; Ogura, H.; Mizuno, K.; Kawano, K.; Mikoshiba, K.; Yakura, H.; Asano, M.; Iwakura, Y. : Impaired learning with enhanced hippocampal long-term potentiation in PTP-del.

[13713] Further studies establishing the function and utilities of PTPRD are found in John Hopkins OMIM database record ID 601598, and in cited publications numbered 933 and 12389 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Replication Factor C (activator 1) 1, 145kDa (RFC1, Accession NM_002913) is another VGAM217 host target gene. RFC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RFC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFC1 BINDING SITE, designated SEQ ID:8820, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13714] Another function of VGAM217 is therefore inhibition of Replication Factor C (activator 1) 1, 145kDa (RFC1, Accession NM_002913), a gene which plays a role in dna transcription, replication and/or repair. Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFC1. The function of RFC1 has been established by previous studies. Replication factor C is a multisubunit, DNA polymerase accessory protein required for the coordinated synthesis of both DNA strands during simian virus 40 DNA replication in vitro. It is a DNA-dependent ATPase that binds in a structure-specific manner to the 3-prime end of a primer hybridized to a template DNA, an activity thought intrinsic to the 140-kD component of this multisubunit complex. Bunz et al. (1993) isolated and analyzed cDNAs encoding the 140-kD subunit. An open reading frame of 3.4 kb was predicted to encode a 1,148-amino acid protein with a predicted molecular mass of 130 kD. A putative ATP-binding motif was observed that is similar to a motif in several of the smaller subunits of RFC and in functionally homologous replication factors of bacterial and viral origin. The predicted protein showed similarities to other DNA-binding proteins. Wang et al. (2000) used

immunoprecipitation and mass spectrometry analyses to identify BRCA1 (OMIM Ref. No. 113705)-associated proteins. They found that BRCA1 is part of a large multisubunit protein complex of tumor suppressors, DNA damage sensors, and signal transducers. They named this complex BASC, for 'BRCA1-associated genome surveillance complex.' Among the DNA repair proteins identified in the complex were ATM (OMIM Ref. No. 208900), BLM (OMIM Ref. No. 604610), MSH2 (OMIM Ref. No. 120435), MSH6 (OMIM Ref. No. 600678), MLH1 (OMIM Ref. No. 120436), the RAD50 (OMIM Ref. No. 604040)-MRE11 (OMIM Ref. No. 600814)-NBS1 (OMIM Ref. No. 602667) complex, and the RFC1-RFC2 (OMIM Ref. No. 600404)-RFC4 (OMIM Ref. No. 102577) complex. Wang et al. (2000) suggested that BASC may serve as a sensor of abnormal DNA structures and/or as a regulator of the postreplication repair process.

[13715] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13716] Bunz, F.; Kobayashi, R.; Stillman, B. : cDNAs encoding the large subunit of human replication factor C. Proc. Nat. Acad. Sci. 90: 11014-11018, 1993. ; and

[13717] Wang, Y.; Cortez, D.; Yazdi, P.; Neff, N.; Elledge, S. J.; Qin, J. : BASC, a super complex of BRCA1-associated proteins involved in the recognition and repair of aberrant DNA structures.

[13718] Further studies establishing the function and utilities of RFC1 are found in John Hopkins OMIM database record ID 102579, and in cited publications numbered 12335-1233 and 7118 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP434P211 (Accession NM_014549) is another VGAM217 host target gene. DKFZP434P211 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434P211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P211 BINDING SITE, designated SEQ ID:15864, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13719] Another function of VGAM217 is therefore inhibition of DKFZP434P211 (Accession NM_014549). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZP434P211. KIAA0354 (Accession NM_014872) is another VGAM217 host target gene. KIAA0354 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0354, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0354 BINDING SITE, designated SEQ ID:16998, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13720] Another function of VGAM217 is therefore inhibition of KIAA0354 (Accession NM_014872). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0354. KIAA0748 (Accession NM_014796) is another VGAM217 host target gene. KIAA0748 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0748, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0748 BINDING SITE, designated SEQ ID:16701, to the nucleotide sequence of VGAM217 RNA, herein designated

VGAM RNA, also designated SEQ ID:2928.

[13721] Another function of VGAM217 is therefore inhibition of KIAA0748 (Accession NM_014796). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0748. KIAA1056 (Accession NM_014894) is another VGAM217 host target gene. KIAA1056 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1056 BINDING SITE, designated SEQ ID:17043, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13722] Another function of VGAM217 is therefore inhibition of KIAA1056 (Accession NM_014894). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1056. KIAA1505 (Accession XM_168469) is another VGAM217 host target gene. KIAA1505 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1505, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1505 BINDING SITE, designated SEQ ID:45192, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13723] Another function of VGAM217 is therefore inhibition of KIAA1505 (Accession XM_168469). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1505. Phosphatidylserine Synthase 2 (PTDSS2, Accession NM_030783) is another VGAM217 host target gene. PTDSS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTDSS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTDSS2 BINDING SITE, designated SEQ ID:25074, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13724] Another function of VGAM217 is therefore inhibition of Phosphatidylserine Synthase 2 (PTDSS2, Accession

NM_030783). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTDSS2. RAB6C, Member RAS Oncogene Family (RAB6C, Accession NM_032144) is another VGAM217 host target gene. RAB6C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB6C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB6C BINDING SITE, designated SEQ ID:25833, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13725] Another function of VGAM217 is therefore inhibition of RAB6C, Member RAS Oncogene Family (RAB6C, Accession NM_032144). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB6C. Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM_014737) is another VGAM217 host target gene. RASSF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASSF2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASSF2 BINDING SITE, designated SEQ ID:16392, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13726] Another function of VGAM217 is therefore inhibition of Ras Association (RalGDS/AF-6) Domain Family 2 (RASSF2, Accession NM_014737). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASSF2. Syntaphilin (SNPH, Accession NM_014723) is another VGAM217 host target gene. SNPH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNPH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNPH BINDING SITE, designated SEQ ID:16290, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13727] Another function of VGAM217 is therefore inhibition of Syntaphilin (SNPH, Accession NM_014723). Accordingly,

utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNPH. Tankyrase, TRF1–interacting Ankyrin–related ADP–ribose Polymerase 2 (TNKS2, Accession NM_025235) is another VGAM217 host target gene. TNKS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNKS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNKS2 BINDING SITE, designated SEQ ID:24911, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13728] Another function of VGAM217 is therefore inhibition of Tankyrase, TRF1–interacting Ankyrin–related ADP–ribose Polymerase 2 (TNKS2, Accession NM_025235). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNKS2. WIT–1 (Accession NM_015855) is another VGAM217 host target gene. WIT–1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by WIT–1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND–

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WIT-1 BINDING SITE, designated SEQ ID:17987, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13729] Another function of VGAM217 is therefore inhibition of WIT-1 (Accession NM_015855). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WIT-1. YKT6 (Accession NM_006555) is another VGAM217 host target gene. YKT6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by YKT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YKT6 BINDING SITE, designated SEQ ID:13317, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13730] Another function of VGAM217 is therefore inhibition of YKT6 (Accession NM_006555). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YKT6.

LOC150174 (Accession XM_086802) is another VGAM217 host target gene. LOC150174 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150174, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150174 BINDING SITE, designated SEQ ID:38871, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13731] Another function of VGAM217 is therefore inhibition of LOC150174 (Accession XM_086802). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150174. LOC150213 (Accession XM_059324) is another VGAM217 host target gene. LOC150213 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150213, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150213 BINDING SITE, designated SEQ ID:36955, to the nucleotide sequence of VGAM217 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2928.

[13732] Another function of VGAM217 is therefore inhibition of LOC150213 (Accession XM_059324). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150213. LOC150236 (Accession XM_086824) is another VGAM217 host target gene. LOC150236 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150236, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150236 BINDING SITE, designated SEQ ID:38904, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13733] Another function of VGAM217 is therefore inhibition of LOC150236 (Accession XM_086824). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150236. LOC158450 (Accession XM_088580) is another VGAM217 host target gene. LOC158450 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158450, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158450 BINDING SITE, designated SEQ ID:39841, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13734] Another function of VGAM217 is therefore inhibition of LOC158450 (Accession XM_088580). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158450. LOC158504 (Accession XM_088591) is another VGAM217 host target gene. LOC158504 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158504, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158504 BINDING SITE, designated SEQ ID:39852, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13735] Another function of VGAM217 is therefore inhibition of LOC158504 (Accession XM_088591). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC158504. LOC158677 (Accession XM_098976) is another VGAM217 host target gene. LOC158677 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158677, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158677 BINDING SITE, designated SEQ ID:42022, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13736] Another function of VGAM217 is therefore inhibition of LOC158677 (Accession XM_098976). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158677. LOC219347 (Accession XM_167564) is another VGAM217 host target gene. LOC219347 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219347, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219347 BINDING SITE, designated SEQ ID:44676, to

the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13737] Another function of VGAM217 is therefore inhibition of LOC219347 (Accession XM_167564). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219347. LOC222962 (Accession XM_167291) is another VGAM217 host target gene. LOC222962 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222962, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222962 BINDING SITE, designated SEQ ID:44626, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13738] Another function of VGAM217 is therefore inhibition of LOC222962 (Accession XM_167291). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222962. LOC245811 (Accession XM_168197) is another VGAM217 host target gene. LOC245811 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC245811, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC245811 BINDING SITE, designated SEQ ID:45071, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13739] Another function of VGAM217 is therefore inhibition of LOC245811 (Accession XM_168197). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC245811. LOC254826 (Accession XM_173188) is another VGAM217 host target gene. LOC254826 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254826 BINDING SITE, designated SEQ ID:46433, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:2928.

[13740] Another function of VGAM217 is therefore inhibition of LOC254826 (Accession XM_173188). Accordingly, utilities

of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254826. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 218 (VGAM218) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13741] VGAM218 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM218 was detected is described hereinabove with reference to Figs. 1–8.

[13742] VGAM218 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Leukemia Virus. VGAM218 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13743] VGAM218 gene encodes a VGAM218 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM218 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM218 precursor RNA is designated SEQ ID:204, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:204 is located at position 6277 relative to the genome of Bovine Leukemia Virus.

[13744] VGAM218 precursor RNA folds onto itself, forming VGAM218 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13745] An enzyme complex designated DICER COMPLEX, `dices` the VGAM218 folded precursor RNA into VGAM218 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM218 RNA is designated SEQ ID:2929, and

is provided hereinbelow with reference to the sequence listing part.

[13746] VGAM218 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM218 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM218 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13747] VGAM218 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM218 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM218 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM218 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM218 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13748] The complementary binding of VGAM218 RNA, herein designated VGAM RNA, to host target binding sites on VGAM218 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM218 host target RNA into VGAM218 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13749] It is appreciated that VGAM218 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM218 host target genes. The mRNA of each one of this plurality of VGAM218 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM218 RNA, herein designated VGAM RNA, and which when bound by VGAM218 RNA causes inhibition of translation of respective one or more VGAM218 host target proteins.

[13750] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM218 gene, herein designated VGAM GENE, on one or more VGAM218 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[13751] It is yet further appreciated that a function of VGAM218 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM218 include diagnosis, prevention and treatment of viral infection by Bovine Leukemia Virus. Specific functions, and accordingly utilities, of VGAM218 correlate with, and may be deduced from, the identity of the host target genes which VGAM218 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13752] Nucleotide sequences of the VGAM218 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM218 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM218 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM218 are further described hereinbelow with reference to Table 1.

[13753] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM218 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM218 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13754] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM218 gene, herein designated VGAM is inhibition of expression of VGAM218 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM218 correlate with, and may be deduced from, the identity of the target genes which VGAM218 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13755] Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM_000109) is a VGAM218 host target gene. DMD BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DMD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE, designated SEQ ID:5571, to the nucleotide sequence of VGAM218 RNA, herein designated VGAM RNA, also designated SEQ ID:2929.

[13756] A function of VGAM218 is therefore inhibition of Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM_000109), a gene which muscular dystrophy . Accordingly, utilities of VGAM218 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMD. The function of DMD has

been established by previous studies. Roberts et al. (1992) described a general approach to the identification of the basic defect in the one-third of DMD patients who do not show a gross rearrangement of the dystrophin gene. The method involved nested amplification, chemical mismatched detection, and sequencing of reverse transcripts of trace amounts of dystrophin mRNA from peripheral blood lymphocytes. Analysis of the entire coding region (11 kb) in 7 patients resulted in detection of a sequence change in each case that was clearly sufficient to cause the disease. All the mutations were expected to cause premature translation termination, and the resulting phenotypes were thus equivalent to those caused by frameshifting deletions; see 300377.0003–300377.0009. Deletions and point mutations in the DMD gene cause either DMD or the milder Becker muscular dystrophy, depending on whether the translational reading frame is lost or maintained. De Angelis et al. (2002) reasoned that because internal in-frame deletions in the protein produce only mild myopathic symptoms, a partially corrected phenotype could be restored by preventing the inclusion of specific mutated exons in the mature dystrophin mRNA. Such control had previously been accomplished by the use

of synthetic oligonucleotides. To circumvent the disadvantageous necessity for periodic administration of the synthetic oligonucleotides, De Angelis et al. (2002) produced several constructs able to express in vivo, in a stable fashion, large amounts of chimeric RNAs containing antisense sequences. They showed that antisense molecules against exon 51 splice junctions were able to direct skipping of that exon in the human DMD deletion 48–50 and to rescue dystrophin synthesis. They also showed that the highest skipping activity occurred when antisense constructs against the 5–prime and 3–prime splice sites were coexpressed in the same cell. The effects were tested in cultured myoblasts from a DMD patient. The deletion of exons 48–50 resulted in a premature termination codon in exon 51. The antisense sequences complementary to exon 51 splice junctions induced efficient skipping of exon 51 and partial rescue of dystrophin synthesis. X-linked dilated cardiomyopathy is a dystrophinopathy characterized by severe cardiomyopathy with no skeletal muscle involvement. Several XLCM patients have been described with mutations that abolish dystrophin muscle isoform expression, but with increased expression of brain and cerebellar Purkinje isoforms of

the gene exclusively in the skeletal muscle. Bastianutto et al. (2001) determined that 2 XLCM patients bore deletions that removed the muscle promoter and exon 1, but not the brain and cerebellar Purkinje promoters. The brain and cerebellar Purkinje promoters were found to be essentially inactive in muscle cell lines and primary cultures. Since dystrophin muscle enhancer 1 (DME1), a muscle-specific enhancer, is preserved in these patients, the authors tested its ability to upregulate the brain and cerebellar Purkinje promoters in muscle cells. Brain and cerebellar Purkinje promoter activity was significantly increased in the presence of DME1, and activation was observed exclusively in cells presenting a skeletal muscle phenotype versus cardiomyocytes. The authors suggested a role for DME1 in the induction of brain and cerebellar Purkinje isoform expression in the skeletal muscle of XLCM patients defective for muscle isoform expression. Animal model experiments lend further support to the function of DMD. Using DNA microarray, Porter et al. (2002) established a molecular signature of dystrophinopathy in the mdx mouse. In leg muscle, 242 differentially expressed genes were identified. Data provided evidence for coordinated activity of numerous compo-

nents of a chronic inflammatory response, including cytokine and chemokine signaling, leukocyte adhesion and diapedesis, invasive cell type-specific markers, and complement system activation. Upregulation of secreted phosphoprotein 1 (SPP1; 166490) mRNA and protein in dystrophic muscle identified a novel linkage between inflammatory cells and repair processes. Extracellular matrix genes were upregulated in mdx to levels similar to those in DMD. Since, unlike DMD, mdx exhibits little fibrosis, data suggested that collagen regulation at post-transcriptional stages may mediate extensive fibrosis in DMD.

[13757] It is appreciated that the abovementioned animal model for DMD is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[13758] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13759] De Angelis, F. G.; Sthandier, O.; Berarducci, B.; Toso, S.; Galluzzi, G.; Ricci, E.; Cossu, G.; Bozzoni, I. : Chimeric snRNA molecules carrying antisense sequences against the splice junctions of exon 51 of the dystrophin pre-

mRNA induce exon skipping and restoration of a dystrophin synthesis in delta-48-50 DMD cells. Proc Nat. Acad. Sci. 99: 9456-9461, 2002. ; and

[13761] Further studies establishing the function and utilities of DMD are found in John Hopkins OMIM database record ID 300377, and in cited publications numbered 7833-7838, 7840, 7841-7848, 7274, 7275, 7849-7854, 4629, 7318-7323, 7276, 7324-7329, 7334-7333, 7335-7339, 7344, 7341-7343, 7277, 7351, 7353, 7354-7363, 7049, 7364-7372, 7376-7375, 7377-7378, 2930-984, 7050-7051, 98 and 988 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LAG1 Longevity Assurance Homolog 2 (*S. cerevisiae*) (LASS2, Accession XM_041889) is another VGAM218 host target gene. LASS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LASS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of LASS2 BINDING SITE, designated SEQ ID:33622, to the nucleotide sequence of VGAM218 RNA, herein designated VGAM RNA, also designated SEQ ID:2929.

[13762] Another function of VGAM218 is therefore inhibition of LAG1 Longevity Assurance Homolog 2 (*S. cerevisiae*) (LASS2, Accession XM_041889). Accordingly, utilities of VGAM218 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LASS2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 219 (VGAM219) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13763] VGAM219 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM219 was detected is described hereinabove with reference to Figs. 1–8.

[13764] VGAM219 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Leukemia Virus. VGAM219 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[13765] VGAM219 gene encodes a VGAM219 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM219 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM219 precursor RNA is designated SEQ ID:205, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:205 is located at position 6411 relative to the genome of Bovine Leukemia Virus.

[13766] VGAM219 precursor RNA folds onto itself, forming VGAM219 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13767] An enzyme complex designated DICER COMPLEX, `dices` the VGAM219 folded precursor RNA into VGAM219 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM219 RNA is designated SEQ ID:2930, and is provided hereinbelow with reference to the sequence listing part.

[13768] VGAM219 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM219 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM219 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13769] VGAM219 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM219 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM219 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM219 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM219 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13770] The complementary binding of VGAM219 RNA, herein designated VGAM RNA, to host target binding sites on VGAM219 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM219 host target RNA into VGAM219 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13771] It is appreciated that VGAM219 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM219 host target genes. The mRNA of each one of this plurality of VGAM219 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM219 RNA, herein designated VGAM RNA, and which when bound by VGAM219 RNA causes inhibition of translation of respective one or more VGAM219 host target proteins.

[13772] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM219 gene, herein designated VGAM GENE, on one or more VGAM219 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[13773] It is yet further appreciated that a function of VGAM219 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM219 include diagnosis, prevention and treatment of viral infection by Bovine Leukemia Virus. Specific functions, and accordingly utilities, of VGAM219 correlate with, and may be deduced from, the identity of the host target genes which VGAM219 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13774] Nucleotide sequences of the VGAM219 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM219 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM219 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM219 are further described hereinbelow with reference to Table 1.

[13775] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM219 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM219 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13776] As mentioned hereinabove with reference to Fig. 1, a function of VGAM219 gene, herein designated VGAM is inhibition of expression of VGAM219 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM219 correlate with, and may be deduced from, the identity of the target genes which VGAM219 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13777] FLJ14525 (Accession NM_032800) is a VGAM219 host target gene. FLJ14525 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14525, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14525 BINDING SITE, designated SEQ ID:26547, to the nucleotide sequence of VGAM219 RNA, herein designated VGAM RNA, also designated SEQ ID:2930.

[13778] A function of VGAM219 is therefore inhibition of FLJ14525 (Accession NM_032800). Accordingly, utilities of VGAM219 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14525. KIAA1280 (Accession XM_045766) is another VGAM219 host target gene. KIAA1280 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1280, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1280 BINDING SITE, designated SEQ ID:34547, to the nucleotide sequence of VGAM219 RNA, herein designated VGAM RNA, also designated SEQ ID:2930.

[13779] Another function of VGAM219 is therefore inhibition of KIAA1280 (Accession XM_045766). Accordingly, utilities of VGAM219 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1280. Vesicular Inhibitory Amino Acid Transporter (VIAAT, Accession NM_080552) is another VGAM219 host target gene. VIAAT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VIAAT, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VIAAT BINDING SITE, designated SEQ ID:27883, to the nucleotide sequence of VGAM219 RNA, herein designated VGAM RNA, also designated SEQ ID:2930.

[13780] Another function of VGAM219 is therefore inhibition of Vesicular Inhibitory Amino Acid Transporter (VIAAT, Accession NM_080552). Accordingly, utilities of VGAM219 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VIAAT. LOC197201 (Accession XM_113839) is another VGAM219 host target gene. LOC197201 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197201 BINDING SITE, designated SEQ ID:42461, to the nucleotide sequence of VGAM219 RNA, herein designated VGAM RNA, also designated SEQ ID:2930.

[13781] Another function of VGAM219 is therefore inhibition of LOC197201 (Accession XM_113839). Accordingly, utilities

of VGAM219 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197201. LOC221895 (Accession XM_166511) is another VGAM219 host target gene. LOC221895 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221895 BINDING SITE, designated SEQ ID:44444, to the nucleotide sequence of VGAM219 RNA, herein designated VGAM RNA, also designated SEQ ID:2930.

[13782] Another function of VGAM219 is therefore inhibition of LOC221895 (Accession XM_166511). Accordingly, utilities of VGAM219 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221895. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 220 (VGAM220) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13783] VGAM220 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM220 was detected is described hereinabove with reference to Figs. 1–8.

[13784] VGAM220 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM220 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13785] VGAM220 gene encodes a VGAM220 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM220 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM220 precursor RNA is designated SEQ ID:206, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:206 is located at position 16550 relative to the genome of Callitrichine Herpesvirus 3.

[13786] VGAM220 precursor RNA folds onto itself, forming VGAM220 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13787] An enzyme complex designated DICER COMPLEX, `dices` the VGAM220 folded precursor RNA into VGAM220 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM220 RNA is designated SEQ ID:2931, and is provided hereinbelow with reference to the sequence listing part.

[13788] VGAM220 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM220 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM220 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[13789] VGAM220 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM220 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM220 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM220 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM220 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13790] The complementary binding of VGAM220 RNA, herein designated VGAM RNA, to host target binding sites on VGAM220 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM220 host target RNA into VGAM220 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13791] It is appreciated that VGAM220 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM220 host target genes. The mRNA of each one of this plurality of VGAM220 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM220 RNA, herein designated VGAM RNA, and which when bound by VGAM220 RNA causes inhibition of translation of respective one or more VGAM220 host target proteins.

[13792] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM220 gene, herein designated VGAM GENE, on one or more VGAM220 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[13793] It is yet further appreciated that a function of VGAM220 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM220 include diagnosis, prevention and treatment of viral infection by Callicitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM220 correlate with, and may be deduced from, the identity of the host target genes which VGAM220 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13794] Nucleotide sequences of the VGAM220 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM220 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM220 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM220 are further
described hereinbelow with reference to Table 1.

[13795] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM220 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM220 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[13796] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM220 gene, herein designated VGAM is
inhibition of expression of VGAM220 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM220 correlate with, and may be deduced
from, the identity of the target genes which VGAM220
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[13797] B-cell CLL/lymphoma 7A (BCL7A, Accession NM_020993)
is a VGAM220 host target gene. BCL7A BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BCL7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL7A BINDING SITE, designated SEQ ID:21989, to the nucleotide sequence of VGAM220 RNA, herein designated VGAM RNA, also designated SEQ ID:2931.

[13798] A function of VGAM220 is therefore inhibition of B-cell CLL/lymphoma 7A (BCL7A, Accession NM_020993). Accordingly, utilities of VGAM220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL7A. Cyclin D1 (PRAD1: parathyroid adenomatosis 1) (CCND1, Accession NM_053056) is another VGAM220 host target gene. CCND1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CCND1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCND1 BINDING SITE, designated SEQ ID:27598, to the nucleotide sequence of VGAM220 RNA, herein designated VGAM RNA, also designated SEQ ID:2931.

[13799] Another function of VGAM220 is therefore inhibition of Cyclin D1 (PRAD1: parathyroid adenomatosis 1) (CCND1, Accession NM_053056), a gene which is involved in the control of cell cycle and is required for Schwann cell proliferation to proceed normally during Wallerian degeneration. Accordingly, utilities of VGAM220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCND1. The function of CCND1 has been established by previous studies. Tsujimoto et al. (1984) cloned the chromosomal breakpoint of chronic lymphocytic leukemia (CLL; OMIM Ref. No. 151400) cells of the B-cell type carrying t(11;14)(q13;q32). The breakpoint was in the joining segment of the heavy chain locus on chromosome 14. A probe that is specific for chromosome 11 and maps immediately 5-prime to the breakpoint on 14q+ was isolated. The probe detected a rearrangement of the homologous genomic DNA segment in CLL cells and in DNA from a diffuse large cell lymphoma with the t(11;14) translocation. This rearranged DNA segment was not present in Burkitt lymphoma cells with the t(8;14) translocation or in nonneoplastic human lymphoblastoid cells. The probe thus can be used to identify and characterize a gene located on 11q13 involved in the

malignant transformation of B cells in the t(11;14) translocation. Tsujimoto et al. (1984) referred to this gene as BCL1. In 2 different cases of B-cell chronic lymphatic leukemia, Tsujimoto et al. (1985) found that the breakpoints on chromosome 11 were within 8 nucleotides of each other and on chromosome 14 involved the J4 DNA segment of the Ig heavy chain segment. Because they detected a 7mer–9mer signallike sequence with a 12–base–long spacer on the normal chromosome 11, close to the breakpoint, they speculated that the t(11;14) chromosome translocation in CLL may be sequence specific and may involve the recombination system for immunoglobulin V–D–J gene segment joining. Animal model experiments lend further support to the function of CCND1. Ma et al. (1998) studied cyclin D1–deficient mice, which have small eyes with thin retinas, and observed that there was a lower level of retinal cell proliferation and a unique pattern of photoreceptor cell death. Death was first observed in scattered clusters of cells in the retina. It then appeared to spread from these few cells to nearby photoreceptors, eventually producing extensive holes in the photoreceptor layer. These holes appeared to be filled with interneurons from the inner nuclear layer. The death

occurred mainly during the second to fourth postnatal weeks. Other models of photoreceptor degeneration in rodents differed in that they occur more uniformly across the retina, with death proceeding over a longer period of time until all, or nearly all, of the photoreceptors degenerate. Ma et al. (1998) found that expression of a bcl2 transgene could not prevent the death.

[13800] It is appreciated that the abovementioned animal model for CCND1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[13801] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13802] Ma, C.; Papermaster, D.; Cepko, C. L. : A unique pattern of photoreceptor degeneration in cyclin D1 mutant mice. Proc. Nat. Acad. Sci. 95: 9938–9943, 1998. ; and

[13803] Tsujimoto, Y.; Yunis, J.; Onorato–Showe, L.; Erikson, J.; Nowell, P. C.; Croce, C. M. : Molecular cloning of the chromosomal breakpoint of B–cell lymphomas and leukemias with the t(11;1.

[13804] Further studies establishing the function and utilities of CCND1 are found in John Hopkins OMIM database record

ID 168461, and in cited publications numbered 2389, 4458, 5452–5453, 11374, 5455–5456, 5468–4344, 5470–5479, 11078–5481, 5614, 11079–1108 and 5615–5618 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chediak–Higashi Syndrome 1 (CHS1, Accession NM_000081) is another VGAM220 host target gene. CHS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHS1 BINDING SITE, designated SEQ ID:5524, to the nucleotide sequence of VGAM220 RNA, herein designated VGAM RNA, also designated SEQ ID:2931.

[13805] Another function of VGAM220 is therefore inhibition of Chediak–Higashi Syndrome 1 (CHS1, Accession NM_000081), a gene which may sort endosomal resident proteins into late multivesicular endosome. Accordingly, utilities of VGAM220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHS1. The function of CHS1 and its association with various diseases and clinical conditions, has been estab-

lished by previous studies, as described hereinabove with reference to VGAM191. Eukaryotic Translation Initiation Factor 2B, Subunit 1 Alpha, 26kDa (EIF2B1, Accession XM_006566) is another VGAM220 host target gene.

EIF2B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF2B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF2B1 BINDING SITE, designated SEQ ID:30004, to the nucleotide sequence of VGAM220 RNA, herein designated VGAM RNA, also designated SEQ ID:2931.

[13806] Another function of VGAM220 is therefore inhibition of Eukaryotic Translation Initiation Factor 2B, Subunit 1 Alpha, 26kDa (EIF2B1, Accession XM_006566). Accordingly, utilities of VGAM220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF2B1. Molybdenum Cofactor Synthesis 2 (MOCS2, Accession NM_004531) is another VGAM220 host target gene. MOCS2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MOCS2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MOCS2 BINDING SITE, designated SEQ ID:10873, to the nucleotide sequence of VGAM220 RNA, herein designated VGAM RNA, also designated SEQ ID:2931.

[13807] Another function of VGAM220 is therefore inhibition of Molybdenum Cofactor Synthesis 2 (MOCS2, Accession NM_004531). Accordingly, utilities of VGAM220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOCS2. Mature T-cell Proliferation 1 (MTCP1, Accession NM_014221) is another VGAM220 host target gene. MTCP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MTCP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTCP1 BINDING SITE, designated SEQ ID:15483, to the nucleotide sequence of VGAM220 RNA, herein designated VGAM RNA, also designated SEQ ID:2931.

[13808] Another function of VGAM220 is therefore inhibition of Mature T-cell Proliferation 1 (MTCP1, Accession

NM_014221). Accordingly, utilities of VGAM220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTCP1. N4BP2 (Accession NM_018177) is another VGAM220 host target gene.

N4BP2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by N4BP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of N4BP2 BINDING SITE, designated SEQ ID:20003, to the nucleotide sequence of VGAM220 RNA, herein designated VGAM RNA, also designated SEQ ID:2931.

[13809] Another function of VGAM220 is therefore inhibition of N4BP2 (Accession NM_018177). Accordingly, utilities of VGAM220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with N4BP2. RALGPS1A (Accession NM_014636) is another VGAM220 host target gene. RALGPS1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RALGPS1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of RALGPS1A BINDING SITE, designated SEQ ID:16016, to the nucleotide sequence of VGAM220 RNA, herein designated VGAM RNA, also designated SEQ ID:2931.

[13810] Another function of VGAM220 is therefore inhibition of RALGPS1A (Accession NM_014636). Accordingly, utilities of VGAM220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RALGPS1A. LOC144348 (Accession XM_084826) is another VGAM220 host target gene. LOC144348 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144348, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144348 BINDING SITE, designated SEQ ID:37720, to the nucleotide sequence of VGAM220 RNA, herein designated VGAM RNA, also designated SEQ ID:2931.

[13811] Another function of VGAM220 is therefore inhibition of LOC144348 (Accession XM_084826). Accordingly, utilities of VGAM220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144348. LOC196418 (Accession XM_113717) is an-

other VGAM220 host target gene. LOC196418 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196418, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196418 BINDING SITE, designated SEQ ID:42368, to the nucleotide sequence of VGAM220 RNA, herein designated VGAM RNA, also designated SEQ ID:2931.

[13812] Another function of VGAM220 is therefore inhibition of LOC196418 (Accession XM_113717). Accordingly, utilities of VGAM220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196418. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 221 (VGAM221) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13813] VGAM221 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM221 was detected is described

hereinabove with reference to Figs. 1–8.

[13814] VGAM221 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM221 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13815] VGAM221 gene encodes a VGAM221 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM221 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM221 precursor RNA is designated SEQ ID:207, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:207 is located at position 46723 relative to the genome of Callitrichine Herpesvirus 3.

[13816] VGAM221 precursor RNA folds onto itself, forming VGAM221 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13817] An enzyme complex designated DICER COMPLEX, `dices` the VGAM221 folded precursor RNA into VGAM221 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM221 RNA is designated SEQ ID:2932, and is provided hereinbelow with reference to the sequence listing part.

[13818] VGAM221 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM221 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM221 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13819] VGAM221 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM221 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM221 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM221 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM221 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13820] The complementary binding of VGAM221 RNA, herein designated VGAM RNA, to host target binding sites on VGAM221 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM221 host target RNA into VGAM221 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13821] It is appreciated that VGAM221 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM221 host target genes. The mRNA of each one of this plurality of VGAM221 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM221 RNA, herein designated VGAM RNA, and which when bound by VGAM221 RNA causes inhibition of translation of respective one or more VGAM221 host target proteins.

[13822] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM221 gene, herein designated VGAM GENE, on one or more VGAM221 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[13823] It is yet further appreciated that a function of VGAM221 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM221 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM221 correlate with, and may be deduced from, the identity of the host target genes which VGAM221 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13824] Nucleotide sequences of the VGAM221 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM221 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM221 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM221 are further described hereinbelow with reference to Table 1.

[13825] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM221 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM221 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13826] As mentioned hereinabove with reference to Fig. 1, a function of VGAM221 gene, herein designated VGAM is inhibition of expression of VGAM221 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM221 correlate with, and may be deduced from, the identity of the target genes which VGAM221 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13827] Breast Carcinoma Amplified Sequence 1 (BCAS1, Accession NM_003657) is a VGAM221 host target gene. BCAS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCAS1, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCAS1 BINDING SITE, designated SEQ ID:9730, to the nucleotide sequence of VGAM221 RNA, herein designated VGAM RNA, also designated SEQ ID:2932.

[13828] A function of VGAM221 is therefore inhibition of Breast Carcinoma Amplified Sequence 1 (BCAS1, Accession NM_003657). Accordingly, utilities of VGAM221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCAS1. Cysteine Knot Superfamily 1, BMP Antagonist 1 (CKTSF1B1, Accession NM_013372) is another VGAM221 host target gene. CKTSF1B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CKTSF1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CKTSF1B1 BINDING SITE, designated SEQ ID:15026, to the nucleotide sequence of VGAM221 RNA, herein designated VGAM RNA, also designated SEQ ID:2932.

[13829] Another function of VGAM221 is therefore inhibition of Cysteine Knot Superfamily 1, BMP Antagonist 1

(CKTSF1B1, Accession NM_013372), a gene which blocks signaling of bone morphogenetic protein (BMP) . Accordingly, utilities of VGAM221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKTSF1B1. The function of CKTSF1B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM28.CTP Synthase (CTPS, Accession XM_114141) is another VGAM221 host target gene. CTPS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CTPS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTPS BINDING SITE, designated SEQ ID:42714, to the nucleotide sequence of VGAM221 RNA, herein designated VGAM RNA, also designated SEQ ID:2932.

[13830] Another function of VGAM221 is therefore inhibition of CTP Synthase (CTPS, Accession XM_114141), a gene which is important in the biosynthesis of phospholipids and nucleic acids. Accordingly, utilities of VGAM221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTPS. The function of CTPS has

been established by previous studies. The catalytic conversion of UTP to CTP is accomplished by the enzyme cytidine-5-prime-triphosphate synthetase (UTP:L-glutamine amido ligase; EC 6.3.4.2). The enzyme is important in the biosynthesis of phospholipids and nucleic acids, and plays a key role in cell growth, development, and tumorigenesis. Thomas et al. (1989) isolated a cDNA clone of the CTP synthetase gene from a rat liver cDNA library. It is a key regulatory enzyme in pyrimidine biosynthesis. These authors have isolated both cDNA and genomic gene sequences from the rat and Chinese hamster. Yamauchi et al. (1990) cloned the CTPS gene and showed that the open reading frame encodes 591 amino acids that have a striking degree of similarity to the structural gene in *E. coli*. Yamauchi et al. (1991) assigned the structural gene to 1p by study of a panel of human/rodent somatic cell hybrids and the CTPS cDNA. By a method of mapping that combines fluorescence in situ hybridization with replicated prometaphase R-bands (Takahashi et al., 1990), Takahashi et al. (1991) mapped the CTPS gene to 1p34.3-p34.1. By high-resolution banding analysis, they further narrowed the assignment to 1p34.1; see Yamauchi et al. (1991). The genomic sequence is distributed in 19

exons covering about 35 kb. Mutations eliminating the feedback regulation of CTPS result in multidrug resistance and mutator phenotype in Chinese hamster ovary (CHO) cells. The region to which the CTPS gene has been mapped is the location of breakpoints involved in several tumor types. Yamauchi et al. (1993) found that inactivating mutations clustered in a highly conserved region of the gene make it feasible to assess the role of such mutations in the development of drug resistance encountered in the treatment of malignant disease and not readily explained by altered expression of the multidrug resistance genes (e.g., 171050).

[13831] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13832] Yamauchi, M.; Yamauchi, N.; Phear, G.; Spurr, N. K.; Martinsson, T.; Weith, A.; Meuth, M. : Genomic organization and chromosomal localization of the human CTP synthetase gene (CTPS). *Genomics* 11: 1088–1096, 1991. ; and

[13833] Whelan, J.; Phear, G.; Yamauchi, M.; Meuth, M. : Clustered base substitutions in CTP synthetase conferring drug resistance in Chinese hamster ovary cells. *Nature Genet.* 3:

317-322, 1993.

[13834] Further studies establishing the function and utilities of CTPS are found in John Hopkins OMIM database record ID 123860, and in cited publications numbered 12754-12759, and 3981 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Epithelial Cell Transforming Sequence 2 Oncogene (ECT2, Accession NM_018098) is another VGAM221 host target gene. ECT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ECT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ECT2 BINDING SITE, designated SEQ ID:19871, to the nucleotide sequence of VGAM221 RNA, herein designated VGAM RNA, also designated SEQ ID:2932.

[13835] Another function of VGAM221 is therefore inhibition of Epithelial Cell Transforming Sequence 2 Oncogene (ECT2, Accession NM_018098), a gene which is a transforming protein that can interact with Rho-like proteins of the Ras superfamily. Accordingly, utilities of VGAM221 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with ECT2. The function of ECT2 has been established by previous studies. ECT2 is a transforming protein that can interact with Rho-like proteins of the Ras superfamily. First isolated in the mouse, the Ect2 gene acts as an oncogene. To investigate its involvement in human tumors, Takai et al. (1995) isolated the human homolog, ECT2, and by fluorescence in situ hybridization determined that the gene is located on 3q26.1–q26.2. Localization to chromosome 3 was confirmed by PCR analysis of human/hamster somatic cell hybrid DNAs. Takai et al. (1998) mapped the Ect2 gene to mouse chromosome band 3B by in situ hybridization. They commented that the EVI1 (OMIM Ref. No. 165215) and Fim3 genes (OMIM Ref. No. 136770) are also in mouse 3B and that the human counterparts of these genes are also linked to ECT2, indicating that this chromosome region is evolutionarily conserved between human and mouse.

[13836] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13837] Takai, S.; Long, J. E.; Yamada, K.; Miki, T. : Chromosomal localization of the human ECT2 proto-oncogene to 3q26.1–q26.2 by somatic cell analysis and fluorescence in

situ hybridization. Genomics 27: 220–222, 1995. ; and

[13838] Takai, S.; Lorenzi, M. V.; Long, J. E.; Yamada, K.; Miki, T. : Assignment of the Ect2 protooncogene to mouse chromosome band 3B by in situ hybridization. Cytogenet. Cell Genet. 81: 83–84.

[13839] Further studies establishing the function and utilities of ECT2 are found in John Hopkins OMIM database record ID 600586, and in cited publications numbered 10215–10216 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Hematopoietic Protein 1 (HEM1, Accession NM_005337) is another VGAM221 host target gene. HEM1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HEM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEM1 BINDING SITE, designated SEQ ID:11808, to the nucleotide sequence of VGAM221 RNA, herein designated VGAM RNA, also designated SEQ ID:2932.

[13840] Another function of VGAM221 is therefore inhibition of Hematopoietic Protein 1 (HEM1, Accession NM_005337). Accordingly, utilities of VGAM221 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with HEM1. Transforming Growth Factor, Beta Receptor II (70/80kDa) (TGFB2, Accession NM_003242) is another VGAM221 host target gene. TGFB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGFB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFB2 BINDING SITE, designated SEQ ID:9244, to the nucleotide sequence of VGAM221 RNA, herein designated VGAM RNA, also designated SEQ ID:2932.

[13841] Another function of VGAM221 is therefore inhibition of Transforming Growth Factor, Beta Receptor II (70/80kDa) (TGFB2, Accession NM_003242). Accordingly, utilities of VGAM221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFB2. DKFZP564D0478 (Accession NM_032125) is another VGAM221 host target gene. DKFZP564D0478 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564D0478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of DKFZP564D0478 BINDING SITE, designated SEQ ID:25809, to the nucleotide sequence of VGAM221 RNA, herein designated VGAM RNA, also designated SEQ ID:2932.

[13842] Another function of VGAM221 is therefore inhibition of DKFZP564D0478 (Accession NM_032125). Accordingly, utilities of VGAM221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D0478. FLJ22169 (Accession NM_024085) is another VGAM221 host target gene. FLJ22169 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22169, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22169 BINDING SITE, designated SEQ ID:23519, to the nucleotide sequence of VGAM221 RNA, herein designated VGAM RNA, also designated SEQ ID:2932.

[13843] Another function of VGAM221 is therefore inhibition of FLJ22169 (Accession NM_024085). Accordingly, utilities of VGAM221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22169.

KIAA0205 (Accession NM_014873) is another VGAM221 host target gene. KIAA0205 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0205 BINDING SITE, designated SEQ ID:17005, to the nucleotide sequence of VGAM221 RNA, herein designated VGAM RNA, also designated SEQ ID:2932.

[13844] Another function of VGAM221 is therefore inhibition of KIAA0205 (Accession NM_014873). Accordingly, utilities of VGAM221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0205. KIAA0685 (Accession NM_014678) is another VGAM221 host target gene. KIAA0685 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0685, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0685 BINDING SITE, designated SEQ ID:16149, to the nucleotide sequence of VGAM221 RNA, herein designated

VGAM RNA, also designated SEQ ID:2932.

[13845] Another function of VGAM221 is therefore inhibition of KIAA0685 (Accession NM_014678). Accordingly, utilities of VGAM221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0685. LOC196283 (Accession XM_113684) is another VGAM221 host target gene. LOC196283 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196283 BINDING SITE, designated SEQ ID:42339, to the nucleotide sequence of VGAM221 RNA, herein designated VGAM RNA, also designated SEQ ID:2932.

[13846] Another function of VGAM221 is therefore inhibition of LOC196283 (Accession XM_113684). Accordingly, utilities of VGAM221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196283. LOC203248 (Accession XM_114659) is another VGAM221 host target gene. LOC203248 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203248, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203248 BINDING SITE, designated SEQ ID:43017, to the nucleotide sequence of VGAM221 RNA, herein designated VGAM RNA, also designated SEQ ID:2932.

[13847] Another function of VGAM221 is therefore inhibition of LOC203248 (Accession XM_114659). Accordingly, utilities of VGAM221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203248. LOC219731 (Accession XM_167596) is another VGAM221 host target gene. LOC219731 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219731, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219731 BINDING SITE, designated SEQ ID:44717, to the nucleotide sequence of VGAM221 RNA, herein designated VGAM RNA, also designated SEQ ID:2932.

[13848] Another function of VGAM221 is therefore inhibition of LOC219731 (Accession XM_167596). Accordingly, utilities of VGAM221 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC219731. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 222 (VGAM222) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13849] VGAM222 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM222 was detected is described hereinabove with reference to Figs. 1–8.

[13850] VGAM222 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM222 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13851] VGAM222 gene encodes a VGAM222 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM222 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM222 precursor RNA is designated SEQ

ID:208, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:208 is located at position 94113 relative to the genome of Calitrichine Herpesvirus 3.

[13852] VGAM222 precursor RNA folds onto itself, forming VGAM222 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13853] An enzyme complex designated DICER COMPLEX, `dices` the VGAM222 folded precursor RNA into VGAM222 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM222 RNA is designated SEQ ID:2933, and is provided hereinbelow with reference to the sequence

listing part.

[13854] VGAM222 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM222 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM222 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13855] VGAM222 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM222 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM222 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM222 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM222 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13856] The complementary binding of VGAM222 RNA, herein designated VGAM RNA, to host target binding sites on VGAM222 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM222 host target RNA into VGAM222 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13857] It is appreciated that VGAM222 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM222 host target genes. The mRNA of each one of this plurality of VGAM222 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM222 RNA, herein designated VGAM

RNA, and which when bound by VGAM222 RNA causes inhibition of translation of respective one or more VGAM222 host target proteins.

[13858] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM222 gene, herein designated VGAM GENE, on one or more VGAM222 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[13859] It is yet further appreciated that a function of VGAM222 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM222 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM222 correlate with, and may be deduced from, the identity of the host target genes which VGAM222 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13860] Nucleotide sequences of the VGAM222 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM222 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM222 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM222 are further described hereinbelow with reference to Table 1.

[13861] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM222 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM222 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13862] As mentioned hereinabove with reference to Fig. 1, a function of VGAM222 gene, herein designated VGAM is

inhibition of expression of VGAM222 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM222 correlate with, and may be deduced from, the identity of the target genes which VGAM222 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13863] SAR1 (Accession NM_020150) is a VGAM222 host target gene. SAR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SAR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SAR1 BINDING SITE, designated SEQ ID:21350, to the nucleotide sequence of VGAM222 RNA, herein designated VGAM RNA, also designated SEQ ID:2933.

[13864] A function of VGAM222 is therefore inhibition of SAR1 (Accession NM_020150), a gene which is involved in transport from the endoplasmic reticulum to the golgi apparatus (by similarity). Accordingly, utilities of VGAM222 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAR1. The function of SAR1 has been established by previous studies. Sugimoto et al. (2001) demonstrated that IQGAP1, a negative

regulator of cell–cell adhesion, is upregulated by gene amplification at 15q26 in 2 gastric cancer cell lines. Amplification at 15q26 had been found in various malignancies, including breast cancers, and FES (OMIM Ref. No. 190030) and/or IGF1R (OMIM Ref. No. 147370) had been identified as targets for gene amplification in breast cancer, melanoma, and pancreatic adenocarcinoma. In contrast, Sugimoto et al. (2001) found that both genes are located telomeric to the amplicon at 15q26 in the 2 gastric cancer cell lines they studied. Fukata et al. (2002) found that IQGAP1, an effector of RAC1 (OMIM Ref. No. 602048) and CDC42, interacts with CLIP170 (RSN; 179838). In Vero fibroblasts, IQGAP1 localized at the polarized leading edge. Expression of a C–terminal fragment of IQGAP1 that included the CLIP170–binding region delocalized GFP–CLIP170 from the tips of microtubules and altered the microtubule array. The authors found that activated RAC1/CDC42, IQGAP1, and CLIP170 form a tripartite complex. Furthermore, expression of an IQGAP1 mutant defective in RAC1/CDC42 binding induced multiple leading edges. These results indicated that RAC1/CDC42 marks special cortical spots where the IQGAP1 and CLIP170 complex is targeted, leading to a polarized mi–

crotubule array and cell polarization.

[13865] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13866] Sugimoto, N.; Imoto, I.; Fukuda, Y.; Kurihara, N.; Kuroda, S.; Tanigami, A.; Kaibuchi, K.; Kamiyama, R.; Inazawa, J. : IQGAP1, a negative regulator of cell–cell adhesion, is up–regulated by gene amplification at 15q26 in gastric cancer cell lines HSC39 and 40A. J. Hum. Genet. 46: 21–25, 2001. ; and

[13867] Fukata, M.; Watanabe, T.; Noritake, J.; Nakagawa, M.; Yamaga, M.; Kuroda, S.; Matsuura, Y.; Iwamatsu, A.; Perez, F.; Kaibuchi, K. : Rac1 and Cdc42 capture microtubules through IQGAP1 an.

[13868] Further studies establishing the function and utilities of SAR1 are found in John Hopkins OMIM database record ID 603379, and in cited publications numbered 180 and 7498–7500 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 4 (SLC4A4, Accession NM_003759) is another VGAM222 host target gene. SLC4A4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by SLC4A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC4A4 BINDING SITE, designated SEQ ID:9835, to the nucleotide sequence of VGAM222 RNA, herein designated VGAM RNA, also designated SEQ ID:2933.

[13869] Another function of VGAM222 is therefore inhibition of Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 4 (SLC4A4, Accession NM_003759), a gene which is a sodium bicarbonate cotransporter. Accordingly, utilities of VGAM222 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A4. The function of SLC4A4 has been established by previous studies. By screening a human heart cDNA library with rat kidney Nbc cDNAs, followed by a PCR approach, Choi et al. (1999) isolated a full-length cDNA encoding a heart NBC, which they called hhNBC. They reported that the coding sequence of hhNBC is identical to that of pNBC (Abuladze et al., 1998). However, the 5-prime untranslated regions of hhNBC and pNBC differ. Northern blot analysis using the 5-prime region of the hhNBC coding sequence as probe detected an approxi-

mately 9-kb transcript that was strongly expressed in pancreas and weakly expressed in heart and brain. Choi et al. (1999) found that both hhNBC and kNBC (Burnham et al., 1997), when expressed in *Xenopus*, are electrogenic. Soleimani and Burnham (2000) stated that kNBC (Burnham et al., 1997) and pNBC (Abuladze et al., 1998) are encoded by splice variants of the same gene, SLC4A4, which they called NBC1. Mutations in the SLC4A4 gene (e.g., 603345.0001, 603345.0002) cause proximal renal tubular acidosis with bilateral glaucoma, cataracts, and band keratopathy (OMIM Ref. No. 604278). Such mutations may increase the bicarbonate concentration in the corneal stroma, which would facilitate calcium deposition leading to band keratopathy. Igarashi et al. (1999) suggested that the kidney and pancreatic NBCs are derived from a common gene by alternative splicing and that mutations at the common region would inactivate both isoforms. Studies by Usui et al. (1999) confirmed that both kidney and pancreatic NBC are involved in the transport of sodium and bicarbonate out of the corneal stroma and into the aqueous humor.

[13870] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [13871] Soleimani, M.; Burnham, C. E. : Physiologic and molecular aspects of the Na(+):HCO(3-) cotransporter in health and disease processes. *Kidney Int.* 57: 371–384, 2000. ; and
- [13872] Choi, I.; Romero, M. F.; Khandoudi, N.; Bril, A.; Boron, W. F. : Cloning and characterization of a human electrogenic Na(+)-HCO(3-) cotransporter isoform (hhNBC). *Am. J. Physiol.* 276: C57.
- [13873] Further studies establishing the function and utilities of SLC4A4 are found in John Hopkins OMIM database record ID 603345, and in cited publications numbered 7954–7960 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transcription Factor Dp-2 (E2F dimerization partner 2) (TFDP2, Accession NM_006286) is another VGAM222 host target gene. TFDP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TFDP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TFDP2 BINDING SITE, designated SEQ ID:12972, to the nucleotide sequence of VGAM222 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2933.

[13874] Another function of VGAM222 is therefore inhibition of Transcription Factor Dp-2 (E2F dimerization partner 2) (TFDP2, Accession NM_006286), a gene which is required for the progression of S-phase during the cell cycle. Accordingly, utilities of VGAM222 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TFDP2. The function of TFDP2 has been established by previous studies. Zhang and Chellappan (1995) cloned an E2F dimerization partner, transcription factor DP2, from a human kidney cDNA library. The TFDP2 gene encodes a predicted 386-amino acid protein that is 68% identical to TFDP1 (OMIM Ref. No. 189902). Northern blot analysis revealed 5 distinct transcript sizes ranging from 1.4 to 9.5 kb, with expression of at least one size observed in all cell lines tested. TFDP2 is able to form a functional heterodimer with E2F1 (OMIM Ref. No. 189971). Zhang et al. (1997) used fluorescence in situ hybridization to map the TFDP2 gene to human chromosome 3q23.

[13875] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

of human DP2, a novel dimerization partner of E2F. *Oncogene* 10: 2085–2093, 1995. ; and

[13877] Zhang, Y.; Venkatraj, V. S.; Fischer, S. G.; Warburton, D.; Chellappan, S. P. : Genomic cloning and chromosomal assignment of the E2F dimerization partner TFDP gene family. *Genomics* 39:.

[13878] Further studies establishing the function and utilities of TFDP2 are found in John Hopkins OMIM database record ID 602160, and in cited publications numbered 76 and 12350 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0923 (Accession NM_014021) is another VGAM222 host target gene. KIAA0923 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0923 BINDING SITE, designated SEQ ID:15238, to the nucleotide sequence of VGAM222 RNA, herein designated VGAM RNA, also designated SEQ ID:2933.

[13879] Another function of VGAM222 is therefore inhibition of KIAA0923 (Accession NM_014021). Accordingly, utilities

of VGAM222 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0923. Zinc Finger Protein 238 (ZNF238, Accession NM_006352) is another VGAM222 host target gene. ZNF238 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF238, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF238 BINDING SITE, designated SEQ ID:13042, to the nucleotide sequence of VGAM222 RNA, herein designated VGAM RNA, also designated SEQ ID:2933.

[13880] Another function of VGAM222 is therefore inhibition of Zinc Finger Protein 238 (ZNF238, Accession NM_006352). Accordingly, utilities of VGAM222 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF238. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 223 (VGAM223) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target

genes is known in the art.

[13881] VGAM223 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM223 was detected is described hereinabove with reference to Figs. 1–8.

[13882] VGAM223 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM223 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13883] VGAM223 gene encodes a VGAM223 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM223 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM223 precursor RNA is designated SEQ ID:209, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:209 is located at position 133004 relative to the genome of Callitrichine Herpesvirus 3.

[13884] VGAM223 precursor RNA folds onto itself, forming VGAM223 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[13885] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM223 folded precursor RNA into VGAM223 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 44%) nucleotide se-
quence of VGAM223 RNA is designated SEQ ID:2934, and
is provided hereinbelow with reference to the sequence
listing part.

[13886] VGAM223 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM223 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM223 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[13887] VGAM223 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM223 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM223 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM223 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM223 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[13888] The complementary binding of VGAM223 RNA, herein designated VGAM RNA, to host target binding sites on VGAM223 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM223 host target RNA into VGAM223 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13889] It is appreciated that VGAM223 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM223 host target genes. The mRNA of each one of this plurality of VGAM223 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM223 RNA, herein designated VGAM RNA, and which when bound by VGAM223 RNA causes inhibition of translation of respective one or more VGAM223 host target proteins.

[13890] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM223 gene, herein designated VGAM GENE, on one or

more VGAM223 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[13891] It is yet further appreciated that a function of VGAM223 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM223 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM223 correlate with, and may be deduced from, the identity of the host target genes which VGAM223 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [13892] Nucleotide sequences of the VGAM223 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM223 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM223 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM223 are further described hereinbelow with reference to Table 1.
- [13893] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM223 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM223 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [13894] As mentioned hereinabove with reference to Fig. 1, a function of VGAM223 gene, herein designated VGAM is inhibition of expression of VGAM223 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM223 correlate with, and may be deduced from, the identity of the target genes which VGAM223 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [13895] Dual Specificity Phosphatase 4 (DUSP4, Accession

NM_001394) is a VGAM223 host target gene. DUSP4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DUSP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUSP4 BINDING SITE, designated SEQ ID:7090, to the nucleotide sequence of VGAM223 RNA, herein designated VGAM RNA, also designated SEQ ID:2934.

[13896] A function of VGAM223 is therefore inhibition of Dual Specificity Phosphatase 4 (DUSP4, Accession NM_001394), a gene which regulates mitogenic signal transduction. Accordingly, utilities of VGAM223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUSP4. The function of DUSP4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM110. Niemann-Pick Disease, Type C1 (NPC1, Accession NM_000271) is another VGAM223 host target gene. NPC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NPC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPC1 BINDING SITE, designated SEQ ID:5815, to the nucleotide sequence of VGAM223 RNA, herein designated VGAM RNA, also designated SEQ ID:2934.

[13897] Another function of VGAM223 is therefore inhibition of Niemann–Pick Disease, Type C1 (NPC1, Accession NM_000271). Accordingly, utilities of VGAM223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPC1. Transcription Factor–like 4 (TCFL4, Accession XM_032817) is another VGAM223 host target gene. TCFL4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TCFL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCFL4 BINDING SITE, designated SEQ ID:31770, to the nucleotide sequence of VGAM223 RNA, herein designated VGAM RNA, also designated SEQ ID:2934.

[13898] Another function of VGAM223 is therefore inhibition of Transcription Factor–like 4 (TCFL4, Accession XM_032817), a gene which interacts with Mad and re–

presses transcription by recruiting the Sin3A–histone deacetylase corepressor complex. Accordingly, utilities of VGAM223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCFL4. The function of TCFL4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172. Zinc Finger Protein (C2H2 type) 277 (ZNF277, Accession NM_021994) is another VGAM223 host target gene. ZNF277 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF277, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF277 BINDING SITE, designated SEQ ID:22535, to the nucleotide sequence of VGAM223 RNA, herein designated VGAM RNA, also designated SEQ ID:2934.

[13899] Another function of VGAM223 is therefore inhibition of Zinc Finger Protein (C2H2 type) 277 (ZNF277, Accession NM_021994). Accordingly, utilities of VGAM223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF277. Chromosome 11

Open Reading Frame 9 (C11orf9, Accession NM_013279) is another VGAM223 host target gene. C11orf9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C11orf9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf9 BINDING SITE, designated SEQ ID:14946, to the nucleotide sequence of VGAM223 RNA, herein designated VGAM RNA, also designated SEQ ID:2934.

[13900] Another function of VGAM223 is therefore inhibition of Chromosome 11 Open Reading Frame 9 (C11orf9, Accession NM_013279). Accordingly, utilities of VGAM223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf9. DKFZP564I0422 (Accession NM_031435) is another VGAM223 host target gene. DKFZP564I0422 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564I0422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I0422 BINDING SITE, designated SEQ ID:25435, to

the nucleotide sequence of VGAM223 RNA, herein designated VGAM RNA, also designated SEQ ID:2934.

[13901] Another function of VGAM223 is therefore inhibition of DKFZP564I0422 (Accession NM_031435). Accordingly, utilities of VGAM223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I0422. FLJ12076 (Accession NM_025187) is another VGAM223 host target gene. FLJ12076 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12076, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12076 BINDING SITE, designated SEQ ID:24825, to the nucleotide sequence of VGAM223 RNA, herein designated VGAM RNA, also designated SEQ ID:2934.

[13902] Another function of VGAM223 is therefore inhibition of FLJ12076 (Accession NM_025187). Accordingly, utilities of VGAM223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12076. FLJ22596 (Accession NM_025086) is another VGAM223 host target gene. FLJ22596 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA

encoded by FLJ22596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22596 BINDING SITE, designated SEQ ID:24705, to the nucleotide sequence of VGAM223 RNA, herein designated VGAM RNA, also designated SEQ ID:2934.

[13903] Another function of VGAM223 is therefore inhibition of FLJ22596 (Accession NM_025086). Accordingly, utilities of VGAM223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22596. HA-1 (Accession XM_037574) is another VGAM223 host target gene. HA-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HA-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HA-1 BINDING SITE, designated SEQ ID:32654, to the nucleotide sequence of VGAM223 RNA, herein designated VGAM RNA, also designated SEQ ID:2934.

[13904] Another function of VGAM223 is therefore inhibition of HA-1 (Accession XM_037574). Accordingly, utilities of

VGAM223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HA-1.

KIAA1056 (Accession NM_014894) is another VGAM223 host target gene. KIAA1056 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1056 BINDING SITE, designated SEQ ID:17048, to the nucleotide sequence of VGAM223 RNA, herein designated VGAM RNA, also designated SEQ ID:2934.

[13905] Another function of VGAM223 is therefore inhibition of KIAA1056 (Accession NM_014894). Accordingly, utilities of VGAM223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1056. KIAA1193 (Accession XM_041843) is another VGAM223 host target gene. KIAA1193 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1193 BINDING SITE, designated SEQ ID:33607, to the nucleotide sequence of VGAM223 RNA, herein designated VGAM RNA, also designated SEQ ID:2934.

[13906] Another function of VGAM223 is therefore inhibition of KIAA1193 (Accession XM_041843). Accordingly, utilities of VGAM223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1193. KIAA1753 (Accession XM_036115) is another VGAM223 host target gene. KIAA1753 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1753 BINDING SITE, designated SEQ ID:32380, to the nucleotide sequence of VGAM223 RNA, herein designated VGAM RNA, also designated SEQ ID:2934.

[13907] Another function of VGAM223 is therefore inhibition of KIAA1753 (Accession XM_036115). Accordingly, utilities of VGAM223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1753. Protocadherin 10 (PCDH10, Accession NM_020815) is another VGAM223 host target gene.

PCDH10 BINDING SITE1 and PCDH10 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDH10, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH10 BINDING SITE1 and PCDH10 BINDING SITE2, designated SEQ ID:21882 and SEQ ID:26767 respectively, to the nucleotide sequence of VGAM223 RNA, herein designated VGAM RNA, also designated SEQ ID:2934.

[13908] Another function of VGAM223 is therefore inhibition of Protocadherin 10 (PCDH10, Accession NM_020815). Accordingly, utilities of VGAM223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH10. LOC203377 (Accession XM_117540) is another VGAM223 host target gene. LOC203377 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203377, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203377 BINDING SITE, designated SEQ ID:43543, to the nucleotide sequence of

VGAM223 RNA, herein designated VGAM RNA, also designated SEQ ID:2934.

[13909] Another function of VGAM223 is therefore inhibition of LOC203377 (Accession XM_117540). Accordingly, utilities of VGAM223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203377. LOC219654 (Accession XM_166095) is another VGAM223 host target gene. LOC219654 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219654, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219654 BINDING SITE, designated SEQ ID:43879, to the nucleotide sequence of VGAM223 RNA, herein designated VGAM RNA, also designated SEQ ID:2934.

[13910] Another function of VGAM223 is therefore inhibition of LOC219654 (Accession XM_166095). Accordingly, utilities of VGAM223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219654. LOC220070 (Accession NM_145308) is another VGAM223 host target gene. LOC220070 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC220070, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220070 BINDING SITE, designated SEQ ID:29819, to the nucleotide sequence of VGAM223 RNA, herein designated VGAM RNA, also designated SEQ ID:2934.

[13911] Another function of VGAM223 is therefore inhibition of LOC220070 (Accession NM_145308). Accordingly, utilities of VGAM223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220070. LOC56959 (Accession XM_088578) is another VGAM223 host target gene. LOC56959 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC56959, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56959 BINDING SITE, designated SEQ ID:39839, to the nucleotide sequence of VGAM223 RNA, herein designated VGAM RNA, also designated SEQ ID:2934.

[13912] Another function of VGAM223 is therefore inhibition of LOC56959 (Accession XM_088578). Accordingly, utilities

of VGAM223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56959. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 224 (VGAM224) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13913] VGAM224 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM224 was detected is described hereinabove with reference to Figs. 1–8.

[13914] VGAM224 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM224 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13915] VGAM224 gene encodes a VGAM224 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM224 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM224 precursor RNA is designated SEQ ID:210, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:210 is located at position 52378 relative to the genome of Calitrichine Herpesvirus 3.

[13916] VGAM224 precursor RNA folds onto itself, forming VGAM224 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13917] An enzyme complex designated DICER COMPLEX, `dices` the VGAM224 folded precursor RNA into VGAM224 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM224 RNA is designated SEQ ID:2935, and

is provided hereinbelow with reference to the sequence listing part.

[13918] VGAM224 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM224 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM224 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13919] VGAM224 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM224 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM224 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM224 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM224 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13920] The complementary binding of VGAM224 RNA, herein designated VGAM RNA, to host target binding sites on VGAM224 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM224 host target RNA into VGAM224 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13921] It is appreciated that VGAM224 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM224 host target genes. The mRNA of each one of this plurality of VGAM224 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM224 RNA, herein designated VGAM RNA, and which when bound by VGAM224 RNA causes inhibition of translation of respective one or more VGAM224 host target proteins.

[13922] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM224 gene, herein designated VGAM GENE, on one or more VGAM224 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[13923] It is yet further appreciated that a function of VGAM224 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM224 correlate with, and may be deduced from, the identity of the host target genes which VGAM224 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13924] Nucleotide sequences of the VGAM224 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM224 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM224 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM224 are further described hereinbelow with reference to Table 1.

[13925] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM224 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM224 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13926] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM224 gene, herein designated VGAM is inhibition of expression of VGAM224 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM224 correlate with, and may be deduced from, the identity of the target genes which VGAM224 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13927] Ankyrin 1, Erythrocytic (ANK1, Accession XM_016774) is a VGAM224 host target gene. ANK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ANK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANK1 BINDING SITE, designated SEQ ID:30287, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:2935.

[13928] A function of VGAM224 is therefore inhibition of Ankyrin 1, Erythrocytic (ANK1, Accession XM_016774). Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK1. Fer (fps/fes related) Tyrosine Kinase (phosphoprotein NCP94) (FER, Accession NM_005246) is

another VGAM224 host target gene. FER BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FER, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FER BINDING SITE, designated SEQ ID:11755, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:2935.

[13929] Another function of VGAM224 is therefore inhibition of Fer (fps/fes related) Tyrosine Kinase (phosphoprotein NCP94) (FER, Accession NM_005246), a gene which Non-receptor protein tyrosine kinase; member of the Src family. Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FER. The function of FER has been established by previous studies. To identify novel protein tyrosine kinase genes expressed in human lymphoid cells, Krolewski et al. (1990) screened B- and T-cell cDNA libraries at low stringency using an FMS (OMIM Ref. No. 164770) tyrosine kinase domain probe. One of 3 genes so identified had been cloned previously by Hao et al. (1989). Arregui et al. (2000) demonstrated that cell-permeable

(OMIM Ref. No. Trojan) peptides containing the third helix of the antennapedia homeodomain fused to a peptide mimicking the juxtamembrane (JMP) region of the cytoplasmic domain of N-cadherin (CDH2; 114020) result in the inhibition of both CDH2 and beta-1 integrin (ITGB1; 135630) function. Microscopic analysis showed that expression of JMP, which binds to the cytoplasmic domain of CDH2, results in a reduction of neurite outgrowth on cadherin substrates. Treatment of cells with JMP resulted in the release of FER from the cadherin complex and its accumulation in the integrin complex. The accumulation of FER in the integrin complex and the inhibitory effects of JMP could be reversed with a peptide that mimics the first coiled-coil domain of FER. The results suggested that FER mediates crosstalk between CDH2 and ITGB1. By Southern analysis of somatic cell hybrid DNAs, Krolewski et al. (1990) assigned the TYK3 gene to human chromosome 5. By in situ hybridization, Morris et al. (1990) concluded that the FER gene is located at 5q21-q22. Asada and Nadeau (1994) mapped the mouse homolog, Fert, to chromosome 11 by interspecific backcross analysis.

[13930] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [13931] Arregui, C.; Pathre, P.; Lilien, J.; Balsamo, J. : The nonreceptor tyrosine kinase Fer mediates cross-talk between N-cadherin and beta-1-integrins. *J. Cell Biol.* 149: 1263-1273, 2000. ; and
- [13932] Morris, C.; Heisterkamp, N.; Hao, Q. L.; Testa, J. R.; Groffen, J. : The human tyrosine kinase gene (FER) maps to chromosome 5 and is deleted in myeloid leukemias with a del(5q). *Cytoge.*
- [13933] Further studies establishing the function and utilities of FER are found in John Hopkins OMIM database record ID 176942, and in cited publications numbered 3341, 12361-12362, 507 and 12666 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Baculoviral IAP Repeat-containing 3 (BIRC3, Accession XM_040715) is another VGAM224 host target gene. BIRC3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BIRC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIRC3 BINDING SITE, designated SEQ ID:33367, to the nucleotide sequence of VGAM224 RNA, herein des-

ignated VGAM RNA, also designated SEQ ID:2935.

[13934] Another function of VGAM224 is therefore inhibition of Baculoviral IAP Repeat-containing 3 (BIRC3, Accession XM_040715). Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC3. LOC196382 (Accession XM_116913) is another VGAM224 host target gene. LOC196382 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196382, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196382 BINDING SITE, designated SEQ ID:43148, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:2935.

[13935] Another function of VGAM224 is therefore inhibition of LOC196382 (Accession XM_116913). Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196382. LOC93097 (Accession XM_049221) is another VGAM224 host target gene. LOC93097 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC93097, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93097 BINDING SITE, designated SEQ ID:35354, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:2935.

[13936] Another function of VGAM224 is therefore inhibition of LOC93097 (Accession XM_049221). Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93097. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 225 (VGAM225) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13937] VGAM225 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM225 was detected is described hereinabove with reference to Figs. 1–8.

[13938] VGAM225 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Callitrichine Herpesvirus 3. VGAM225 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13939] VGAM225 gene encodes a VGAM225 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM225 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM225 precursor RNA is designated SEQ ID:211, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:211 is located at position 113297 relative to the genome of Callitrichine Herpesvirus 3.

[13940] VGAM225 precursor RNA folds onto itself, forming VGAM225 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13941] An enzyme complex designated DICER COMPLEX, `dices` the VGAM225 folded precursor RNA into VGAM225 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM225 RNA is designated SEQ ID:2936, and is provided hereinbelow with reference to the sequence listing part.

[13942] VGAM225 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM225 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM225 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13943] VGAM225 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM225 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM225 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM225 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM225 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[13944] The complementary binding of VGAM225 RNA, herein designated VGAM RNA, to host target binding sites on VGAM225 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM225 host tar-

get RNA into VGAM225 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13945] It is appreciated that VGAM225 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM225 host target genes. The mRNA of each one of this plurality of VGAM225 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM225 RNA, herein designated VGAM RNA, and which when bound by VGAM225 RNA causes inhibition of translation of respective one or more VGAM225 host target proteins.

[13946] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM225 gene, herein designated VGAM GENE, on one or more VGAM225 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[13947] It is yet further appreciated that a function of VGAM225 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM225 include diagnosis, prevention and treatment of viral infection by Callicitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM225 correlate with, and may be deduced from, the identity of the host target genes which VGAM225 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13948] Nucleotide sequences of the VGAM225 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM225 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM225 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM225 are further

described hereinbelow with reference to Table 1.

[13949] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM225 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM225 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13950] As mentioned hereinabove with reference to Fig. 1, a function of VGAM225 gene, herein designated VGAM is inhibition of expression of VGAM225 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM225 correlate with, and may be deduced from, the identity of the target genes which VGAM225 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13951] Glutathione Peroxidase 3 (plasma) (GPX3, Accession NM_002084) is a VGAM225 host target gene. GPX3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPX3

BINDING SITE, designated SEQ ID:7878, to the nucleotide sequence of VGAM225 RNA, herein designated VGAM RNA, also designated SEQ ID:2936.

[13952] A function of VGAM225 is therefore inhibition of Glutathione Peroxidase 3 (plasma) (GPX3, Accession NM_002084), a gene which reduces lipid hydroperoxide and H₂O₂ in plasma. Accordingly, utilities of VGAM225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPX3. The function of GPX3 has been established by previous studies. Glutathione peroxidase (EC 1.11.1.9) catalyzes the reduction of hydrogen peroxide, organic hydroperoxide, and lipid peroxides by reduced glutathione and functions in the protection of cells against oxidative damage. This enzyme, found mainly in the cytosol of mammalian cells, is unusual in its content of a selenocysteine residue in its active site that is encoded by a TGA opal codon (Chambers et al., 1986). The glutathione peroxidase found in plasma is immunologically distinct from the erythrocyte and liver cytosolic enzymes (OMIM Ref. No. 138320). It also has some differences in physical and kinetic properties. Takahashi et al. (1990) isolated cDNA clones coding for plasma GPX. They found that the nu-

cleotide sequence consisted of a 678-bp open reading frame coding for a 226-amino acid polypeptide with a molecular mass of 25,389. The amino acid sequence showed only 44% homology with human cellular GPX. Northern blot analysis showed a single transcript of 2.2 kb in the polyadenylated RNA fractions of human placenta and of a human hepatic cell line, HepG2, but not in those of human liver and endothelial cells. Takahashi et al. (1990) concluded that as the plasma enzyme contains 1 atom of selenium per subunit, the in-frame TGA observed at positions 217–219 could be assigned to selenocysteine. Chu et al. (1992) found that glutathione peroxidase–3 is expressed in kidney, lung, heart, breast, placenta, and, in the human but not the rodent, in liver as well. By Southern analysis of genomic DNA from human/hamster somatic cell hybrids, Chu (1994) mapped the GPX3 gene to chromosome 5.

[13953] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[13954] Chu, F.–F.; Esworthy, R. S.; Doroshov, J. H.; Doan, K.; Liu, X.–F. : Expression of glutathione peroxidase in human liver in addition to kidney, heart, lung, and breast in hu–

mans and rodents. Blood 79: 3233–3238, 1992. ; and

[13955] Takahashi, K.; Akasaka, M.; Yamamoto, Y.; Kobayashi, C.; Mizoguchi, J.; Koyama, J. : Primary structure of human plasma glutathione peroxidase deduced from cDNA sequences. J. Biochem. 108.

[13956] Further studies establishing the function and utilities of GPX3 are found in John Hopkins OMIM database record ID 138321, and in cited publications numbered 374 and 3745–3746 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 226 (VGAM226) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13957] VGAM226 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM226 was detected is described hereinabove with reference to Figs. 1–8.

[13958] VGAM226 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM226 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[13959] VGAM226 gene encodes a VGAM226 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM226 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM226 precursor RNA is designated SEQ ID:212, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:212 is located at position 82259 relative to the genome of Calitrichine Herpesvirus 3.

[13960] VGAM226 precursor RNA folds onto itself, forming VGAM226 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13961] An enzyme complex designated DICER COMPLEX, `dices` the VGAM226 folded precursor RNA into VGAM226 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM226 RNA is designated SEQ ID:2937, and is provided hereinbelow with reference to the sequence listing part.

[13962] VGAM226 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM226 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM226 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13963] VGAM226 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM226 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM226 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM226 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM226 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13964] The complementary binding of VGAM226 RNA, herein designated VGAM RNA, to host target binding sites on VGAM226 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM226 host target RNA into VGAM226 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[13965] It is appreciated that VGAM226 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM226 host target genes. The mRNA of each one of this plurality of VGAM226 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM226 RNA, herein designated VGAM RNA, and which when bound by VGAM226 RNA causes inhibition of translation of respective one or more VGAM226 host target proteins.

[13966] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM226 gene, herein designated VGAM GENE, on one or more VGAM226 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[13967] It is yet further appreciated that a function of VGAM226 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM226 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM226 correlate with, and may be deduced from, the identity of the host target genes which VGAM226 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13968] Nucleotide sequences of the VGAM226 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM226 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM226 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM226 are further described hereinbelow with reference to Table 1.

[13969] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM226 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM226 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13970] As mentioned hereinabove with reference to Fig. 1, a function of VGAM226 gene, herein designated VGAM is inhibition of expression of VGAM226 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM226 correlate with, and may be deduced from, the identity of the target genes which VGAM226 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13971] MGC1136 (Accession NM_024025) is a VGAM226 host target gene. MGC1136 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC1136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC1136 BINDING SITE, designated SEQ ID:23453, to the nucleotide sequence of VGAM226 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2937.

[13972] A function of VGAM226 is therefore inhibition of MGC1136 (Accession NM_024025). Accordingly, utilities of VGAM226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC1136. MGC4796 (Accession XM_029031) is another VGAM226 host target gene. MGC4796 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4796 BINDING SITE, designated SEQ ID:30826, to the nucleotide sequence of VGAM226 RNA, herein designated VGAM RNA, also designated SEQ ID:2937.

[13973] Another function of VGAM226 is therefore inhibition of MGC4796 (Accession XM_029031). Accordingly, utilities of VGAM226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4796. LOC92539 (Accession XM_045632) is another VGAM226 host target gene. LOC92539 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92539, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92539 BINDING SITE, designated SEQ ID:34497, to the nucleotide sequence of VGAM226 RNA, herein designated VGAM RNA, also designated SEQ ID:2937.

[13974] Another function of VGAM226 is therefore inhibition of LOC92539 (Accession XM_045632). Accordingly, utilities of VGAM226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92539. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 227 (VGAM227) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13975] VGAM227 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM227 was detected is described hereinabove with reference to Figs. 1–8.

[13976] VGAM227 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus

3. VGAM227 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[13977] VGAM227 gene encodes a VGAM227 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM227 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM227 precursor RNA is designated SEQ ID:213, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:213 is located at position 28474 relative to the genome of Calitrichine Herpesvirus 3.

[13978] VGAM227 precursor RNA folds onto itself, forming VGAM227 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[13979] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM227 folded precursor RNA into VGAM227 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM227 RNA is designated SEQ ID:2938, and is provided hereinbelow with reference to the sequence listing part.

[13980] VGAM227 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM227 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM227 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[13981] VGAM227 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM227 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM227 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM227 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM227 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[13982] The complementary binding of VGAM227 RNA, herein designated VGAM RNA, to host target binding sites on VGAM227 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM227 host target RNA into VGAM227 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[13983] It is appreciated that VGAM227 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM227 host target genes. The mRNA of each one of this plurality of VGAM227 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM227 RNA, herein designated VGAM RNA, and which when bound by VGAM227 RNA causes inhibition of translation of respective one or more VGAM227 host target proteins.

[13984] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM227 gene, herein designated VGAM GENE, on one or more VGAM227 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[13985] It is yet further appreciated that a function of VGAM227 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM227 correlate with, and may be deduced from, the identity of the host target genes which VGAM227 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[13986] Nucleotide sequences of the VGAM227 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM227 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM227 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM227 are further described hereinbelow with reference to Table 1.

[13987] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM227 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM227 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[13988] As mentioned hereinabove with reference to Fig. 1, a function of VGAM227 gene, herein designated VGAM is inhibition of expression of VGAM227 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM227 correlate with, and may be deduced from, the identity of the target genes which VGAM227 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[13989] TRIM (Accession NM_016388) is a VGAM227 host target gene. TRIM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM BINDING SITE, designated SEQ ID:18532, to the nucleotide sequence of VGAM227 RNA, herein des-

ignated VGAM RNA, also designated SEQ ID:2938.

[13990] A function of VGAM227 is therefore inhibition of TRIM (Accession NM_016388), a gene which plays a role in recruiting signaling proteins to the plasma membrane upon T-cell receptor (TCR) complex activation in T cells. Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM. The function of TRIM has been established by previous studies. T-cell activation requires stimulation of the T-cell receptor (TCR; OMIM Ref. No. 186880)–CD3 (see OMIM Ref. No. CD3Z; 186780) complex, followed by recruitment of an array of intracellular signaling proteins (e.g., GRB2 (OMIM Ref. No. 108355) and PLCG1 (OMIM Ref. No. 172420)). Mediating the interaction between the extracellular receptors and intracellular signaling pathways are adaptor proteins such as LAT (OMIM Ref. No. 602354). Bruyns et al. (1998) purified a 29/30-kD disulfide-linked dimeric phosphoprotein, which they called TRIM (TCR-interacting molecule), that associates and comodulates with the TCR–CD3 complex in T lymphocytes. By tryptic peptide sequence analysis and touchdown PCR analysis of a T-cell cDNA library, they isolated a cDNA encoding TRIM. Sequence analysis predicted

that TRIM is a 186-amino acid type III transmembrane protein containing an 8-amino acid extracellular domain, which includes a cys residue, and a 19-amino acid transmembrane region that lacks charged residues. The intracellular portion possesses 4 potential phosphorylation sites and 8 tyrosine residues, at least 3 of which may be involved in Src (OMIM Ref. No. 190090) homology 2 (SH2)-mediated interactions with other signaling proteins. Northern blot analysis detected preferential expression of an approximately 2.0-kb TRIM transcript in thymus, with weaker expression in spleen, lymph nodes, and peripheral blood leukocytes. Western blot analysis of hematopoietic cell lines detected TRIM protein in T cell lines and, to a lesser extent, in natural killer cell lines, but not in B cell lines or in a monocytic cell line. Immunofluorescence and Western blot analyses showed that TRIM is localized in the cell membrane and is associated with CD3E (OMIM Ref. No. 186830) and CD3Z. The authors found that after T-cell activation, TRIM is phosphorylated by Src kinases on tyrosine residues, then associates with PIK3R1 (OMIM Ref. No. 171833).

[13991] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [13992] Bruyns, E.; Marie-Cardine, A.; Kirchgessner, H.; Sagolla, K.; Shevchenko, A.; Mann, M.; Autschbach, F.; Bensussan, A.; Meuer, S.; Schraven, B. : T cell receptor (TCR) interacting molecule (TRIM), a novel disulfide-linked dimer associated with the TCR-CD3-zeta complex, recruits intracellular signaling proteins to the plasma membrane. J. Exp. Med. 188: 561-575, 1998. ; and

- [13994] Further studies establishing the function and utilities of TRIM are found in John Hopkins OMIM database record ID 604962, and in cited publications numbered 5002 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ22060 (Accession NM_024612) is another VGAM227 host target gene. FLJ22060 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22060, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of FLJ22060 BINDING SITE, designated SEQ ID:23867, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:2938.

[13995] Another function of VGAM227 is therefore inhibition of FLJ22060 (Accession NM_024612). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22060. HBP1 (Accession NM_012257) is another VGAM227 host target gene. HBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HBP1 BINDING SITE, designated SEQ ID:14563, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:2938.

[13996] Another function of VGAM227 is therefore inhibition of HBP1 (Accession NM_012257). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HBP1. LOC148823 (Accession NM_145278) is another VGAM227

host target gene. LOC148823 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148823, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148823 BINDING SITE, designated SEQ ID:29795, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:2938.

[13997] Another function of VGAM227 is therefore inhibition of LOC148823 (Accession NM_145278). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148823. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 228 (VGAM228) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[13998] VGAM228 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM228 was detected is described

hereinabove with reference to Figs. 1–8.

[13999] VGAM228 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Calitrichine Herpesvirus 3. VGAM228 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14000] VGAM228 gene encodes a VGAM228 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM228 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM228 precursor RNA is designated SEQ ID:214, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:214 is located at position 130971 relative to the genome of Calitrichine Herpesvirus 3.

[14001] VGAM228 precursor RNA folds onto itself, forming VGAM228 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14002] An enzyme complex designated DICER COMPLEX, `dices` the VGAM228 folded precursor RNA into VGAM228 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM228 RNA is designated SEQ ID:2939, and is provided hereinbelow with reference to the sequence listing part.

[14003] VGAM228 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM228 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM228 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[14004] VGAM228 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM228 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM228 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM228 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM228 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[14005] The complementary binding of VGAM228 RNA, herein designated VGAM RNA, to host target binding sites on VGAM228 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM228 host target RNA into VGAM228 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14006] It is appreciated that VGAM228 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM228 host target genes. The mRNA of each one of this plurality of VGAM228 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM228 RNA, herein designated VGAM RNA, and which when bound by VGAM228 RNA causes inhibition of translation of respective one or more VGAM228 host target proteins.

[14007] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM228 gene, herein designated VGAM GENE, on one or more VGAM228 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[14008] It is yet further appreciated that a function of VGAM228 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM228 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM228 correlate with, and may be deduced from, the identity of the host target genes which VGAM228 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14009] Nucleotide sequences of the VGAM228 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM228 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM228 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM228 are further described hereinbelow with reference to Table 1.

[14010] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM228 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM228 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14011] As mentioned hereinabove with reference to Fig. 1, a function of VGAM228 gene, herein designated VGAM is inhibition of expression of VGAM228 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM228 correlate with, and may be deduced from, the identity of the target genes which VGAM228 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14012] Forkhead Box O1A (rhabdomyosarcoma) (FOXO1A, Accession NM_002015) is a VGAM228 host target gene. FOXO1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FOXO1A, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXO1A BINDING SITE, designated SEQ ID:7760, to the nucleotide sequence of VGAM228 RNA, herein designated VGAM RNA, also designated SEQ ID:2939.

[14013] A function of VGAM228 is therefore inhibition of Forkhead Box O1A (rhabdomyosarcoma) (FOXO1A, Accession NM_002015), a gene which is a probable transcription factor. Accordingly, utilities of VGAM228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXO1A. The function of FOXO1A has been established by previous studies. In alveolar rhabdomyosarcoma, the translocation t(2;13)(q35;q14) is frequently found. Barr et al. (1993) determined that PAX3 (OMIM Ref. No. 606597), which had previously been found to be mutated in Waardenburg syndrome (OMIM Ref. No. 193500), was affected by this t(2;13) in alveolar rhabdomyosarcoma (OMIM Ref. No. 268220). Galili et al. (1993) isolated the chromosome 13 gene that is fused with PAX3. The rearrangement breakpoints occurred within an intron downstream of the paired box and homeodomain-encoding regions. and identified it as a member

of the forkhead domain family, which encodes transcription factors containing a conserved DNA-binding motif related to the *Drosophila* region-specific homeotic gene 'forkhead.' The distal half of the forkhead and the C-terminal region of the FKHR gene are involved in the chimeric transcript and fusion protein. (Because of the homology to 'forkhead,' the gene was symbolized FKHR, for 'forkhead' in rhabdomyosarcoma.) See human T-cell leukemia virus enhancer factor (OMIM Ref. No. 143089) and interleukin enhancer binding factor (OMIM Ref. No. 147685) for other members of the forkhead domain family of transcription factors. Fredericks et al. (1995) demonstrated expression of a 97-kD PAX3/FKHR fusion protein in a t(2;13)-positive rhabdomyosarcoma cell line and verified that a single polypeptide contained epitopes derived from each protein. The fusion protein was localized to the nucleus in these cells, as was wildtype PAX3 in cells lacking the translocation. They found that DNA binding of the fusion protein was significantly impaired relative to that of PAX3 despite the fact that the 2 proteins had identical PAX DNA-binding domains. However, the fusion protein was a much more potent transcriptional activator than PAX3. Thus, the fusion protein may function as

an oncogenic transcription factor by enhancing activation of normal PAX3 target genes.

[14014] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14015] Barr, F. G.; Galili, N.; Holick, J.; Biegel, J. A.; Rovera, G.; Emanuel, B. S. : Rearrangement of the PAX3 paired box gene in the paediatric solid tumor alveolar rhabdomyosarcoma. Nature Genet. 3: 113–117, 1993. ; and

[14016] Fredericks, W. J.; Galili, N.; Mukhopadhyay, S.; Rovera, G.; Bennicelli, J.; Barr, F. G.; Rauscher, F. J., III : The PAX3–FKHR fusion protein created by the t(2;13) translocation in alve.

[14017] Further studies establishing the function and utilities of FOXO1A are found in John Hopkins OMIM database record ID 136533, and in cited publications numbered 12164–12170, 1219 and 2126–2128 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. HUS1 Checkpoint Homolog (*S. pombe*) (HUS1, Accession XM_165873) is another VGAM228 host target gene. HUS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HUS1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HUS1 BINDING SITE, designated SEQ ID:43789, to the nucleotide sequence of VGAM228 RNA, herein designated VGAM RNA, also designated SEQ ID:2939.

[14018] Another function of VGAM228 is therefore inhibition of HUS1 Checkpoint Homolog (*S. pombe*) (HUS1, Accession XM_165873), a gene which May form DNA damage-responsive protein complex . Accordingly, utilities of VGAM228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUS1. The function of HUS1 has been established by previous studies. The *S. pombe* 'checkpoint rad' genes *hus1*, *rad1* (OMIM Ref. No. 603153), *rad3*, *rad9* (OMIM Ref. No. 603761), *rad17* (OMIM Ref. No. 603139), and *rad26* are essential for both the incomplete DNA replication (S-M) and DNA damage checkpoints. An early step in the DNA damage checkpoint response appears to involve activation of the *rad3* phosphatidylinositol 3-kinase-related (PIK-R) checkpoint kinase (see OMIM Ref. No. AT; 208900) by the other 5 checkpoint rad gene products. Kostrub et al. (1998) found that the fission yeast *hus1* and *rad1* proteins

form a stable complex, and that the formation of this complex is dependent on rad9, suggesting that these 3 proteins may exist in a discrete complex in the absence of checkpoint activation. Hus1 is phosphorylated in response to DNA damage, and this phosphorylation requires rad3 and the other checkpoint rad genes. By searching EST databases, Kostrub et al. (1998) and Dean et al. (1998) each identified mouse and human cDNAs encoding hus1 homologs. Kostrub et al. (1998) reported that the predicted 281-amino acid human protein shares 30% and 86% identity with *S. pombe* hus1 and mouse Hus1, respectively. However, neither mammalian gene complemented a fission yeast hus1 mutation. Volkmer and Karnitz (1999) demonstrated that the human RAD1 and HUS1 proteins associate in a complex that interacts with a highly modified form of RAD9. They concluded that these 3 proteins are central components of a DNA damage-responsive protein complex in human cells. AU-rich elements (AREs) are cis-acting sequences typically found in 3-prime untranslated regions of many labile mRNAs. AREs either mediate rapid degradation of mRNA or inhibit its translation. Dominguez et al. (1998) identified EE2-16C, a HUS1 cDNA, among a collection of ARE-containing mR-

NAs.

- [14019] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [14020] Kostrub, C. F.; Knudsen, K.; Subramani, S.; Enoch, T. : Hus1p, a conserved fission yeast checkpoint protein, interacts with Rad1p and is phosphorylated in response to DNA damage. EMBO J. 17: 2055–2066, 1998. ; and
- [14021] Volkmer, E.; Karnitz, L. M. : Human homologs of Schizosaccharomyces pombe Rad1, Hus1, and Rad9 form a DNA damage–responsive protein complex. J. Biol. Chem. 274: 567–570, 1999.
- [14022] Further studies establishing the function and utilities of HUS1 are found in John Hopkins OMIM database record ID 603760, and in cited publications numbered 690, 7624–762 and 2422 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Basic, Immunoglobulin–like Variable Motif Containing (BIVM, Accession NM_017693) is another VGAM228 host target gene. BIVM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BIVM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BIND–

ING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIVM BINDING SITE, designated SEQ ID:19253, to the nucleotide sequence of VGAM228 RNA, herein designated VGAM RNA, also designated SEQ ID:2939.

[14023] Another function of VGAM228 is therefore inhibition of Basic, Immunoglobulin-like Variable Motif Containing (BIVM, Accession NM_017693). Accordingly, utilities of VGAM228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIVM. Chromosome 6 Open Reading Frame 37 (C6orf37, Accession XM_041375) is another VGAM228 host target gene. C6orf37 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C6orf37, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf37 BINDING SITE, designated SEQ ID:33516, to the nucleotide sequence of VGAM228 RNA, herein designated VGAM RNA, also designated SEQ ID:2939.

[14024] Another function of VGAM228 is therefore inhibition of Chromosome 6 Open Reading Frame 37 (C6orf37, Acces-

sion XM_041375). Accordingly, utilities of VGAM228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf37. KIAA1615 (Accession XM_044021) is another VGAM228 host target gene. KIAA1615 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1615 BINDING SITE, designated SEQ ID:34089, to the nucleotide sequence of VGAM228 RNA, herein designated VGAM RNA, also designated SEQ ID:2939.

[14025] Another function of VGAM228 is therefore inhibition of KIAA1615 (Accession XM_044021). Accordingly, utilities of VGAM228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1615. p21(CDKN1A)-activated Kinase 7 (PAK7, Accession XM_045653) is another VGAM228 host target gene. PAK7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAK7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of PAK7 BINDING SITE, designated SEQ ID:34508, to the nucleotide sequence of VGAM228 RNA, herein designated VGAM RNA, also designated SEQ ID:2939.

[14026] Another function of VGAM228 is therefore inhibition of p21(CDKN1A)-activated Kinase 7 (PAK7, Accession XM_045653). Accordingly, utilities of VGAM228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK7. SMOC2 (Accession XM_051452) is another VGAM228 host target gene. SMOC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMOC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMOC2 BINDING SITE, designated SEQ ID:35833, to the nucleotide sequence of VGAM228 RNA, herein designated VGAM RNA, also designated SEQ ID:2939.

[14027] Another function of VGAM228 is therefore inhibition of SMOC2 (Accession XM_051452). Accordingly, utilities of VGAM228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMOC2.

LOC150372 (Accession XM_086893) is another VGAM228 host target gene. LOC150372 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150372, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150372 BINDING SITE, designated SEQ ID:38937, to the nucleotide sequence of VGAM228 RNA, herein designated VGAM RNA, also designated SEQ ID:2939.

[14028] Another function of VGAM228 is therefore inhibition of LOC150372 (Accession XM_086893). Accordingly, utilities of VGAM228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150372. LOC151760 (Accession XM_098117) is another VGAM228 host target gene. LOC151760 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151760, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151760 BINDING SITE, designated SEQ ID:41388, to the nucleotide sequence of VGAM228 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2939.

[14029] Another function of VGAM228 is therefore inhibition of LOC151760 (Accession XM_098117). Accordingly, utilities of VGAM228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151760. LOC221300 (Accession XM_166322) is another VGAM228 host target gene. LOC221300 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221300 BINDING SITE, designated SEQ ID:44146, to the nucleotide sequence of VGAM228 RNA, herein designated VGAM RNA, also designated SEQ ID:2939.

[14030] Another function of VGAM228 is therefore inhibition of LOC221300 (Accession XM_166322). Accordingly, utilities of VGAM228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221300. LOC221489 (Accession XM_168066) is another VGAM228 host target gene. LOC221489 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221489, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221489 BINDING SITE, designated SEQ ID:44982, to the nucleotide sequence of VGAM228 RNA, herein designated VGAM RNA, also designated SEQ ID:2939.

[14031] Another function of VGAM228 is therefore inhibition of LOC221489 (Accession XM_168066). Accordingly, utilities of VGAM228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221489. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 229 (VGAM229) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14032] VGAM229 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM229 was detected is described hereinabove with reference to Figs. 1–8.

[14033] VGAM229 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus

3. VGAM229 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14034] VGAM229 gene encodes a VGAM229 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM229 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM229 precursor RNA is designated SEQ ID:215, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:215 is located at position 61747 relative to the genome of Calitrichine Herpesvirus 3.

[14035] VGAM229 precursor RNA folds onto itself, forming VGAM229 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14036] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM229 folded precursor RNA into VGAM229 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM229 RNA is designated SEQ ID:2940, and is provided hereinbelow with reference to the sequence listing part.

[14037] VGAM229 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM229 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM229 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[14038] VGAM229 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM229 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM229 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM229 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM229 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[14039] The complementary binding of VGAM229 RNA, herein designated VGAM RNA, to host target binding sites on VGAM229 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM229 host target RNA into VGAM229 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14040] It is appreciated that VGAM229 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM229 host target genes. The mRNA of each one of this plurality of VGAM229 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM229 RNA, herein designated VGAM RNA, and which when bound by VGAM229 RNA causes inhibition of translation of respective one or more VGAM229 host target proteins.

[14041] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM229 gene, herein designated VGAM GENE, on one or more VGAM229 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[14042] It is yet further appreciated that a function of VGAM229 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM229 correlate with, and may be deduced from, the identity of the host target genes which VGAM229 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14043] Nucleotide sequences of the VGAM229 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM229 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM229 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM229 are further described hereinbelow with reference to Table 1.

[14044] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM229 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM229 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14045] As mentioned hereinabove with reference to Fig. 1, a function of VGAM229 gene, herein designated VGAM is inhibition of expression of VGAM229 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM229 correlate with, and may be deduced from, the identity of the target genes which VGAM229 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14046] ATP-binding Cassette, Sub-family D (ALD), Member 2 (ABCD2, Accession NM_005164) is a VGAM229 host target gene. ABCD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABCD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCD2 BINDING SITE, designated SEQ

ID:11657, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14047] A function of VGAM229 is therefore inhibition of ATP-binding Cassette, Sub-family D (ALD), Member 2 (ABCD2, Accession NM_005164), a gene which probable transporter. Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCD2. The function of ABCD2 has been established by previous studies. Lombard-Platet et al. (1996) described the cloning and characterization of a mouse Ald-related gene, symbolized Aldr by them, that codes for a 741-amino acid protein sharing the same half-ABC transporter structure and 66% amino acid identity with the protein that is mutant in X-linked adrenoleukodystrophy (ALD; 300100). PMP70 (OMIM Ref. No. 170995), another half-ABC transporter in the peroxisomal membrane protein, had 38% sequence identity to the mouse Aldr protein. Lombard-Platet et al. (1996) showed that the mouse Aldr protein is associated with peroxisomes. The mouse Ald and Aldr genes show overlapping but distinctive expression patterns. Interestingly, at least in mouse, Aldr is expressed at high levels in brain

and adrenal, 2 organs with major involvement in adrenoleukodystrophy. Using oligonucleotide primers designed from the mouse sequence, the authors PCR-amplified 2 overlapping fragments of an 866-bp segment from human genomic DNA. This segment from the human ALDR ortholog shares 90% amino acid identity with the mouse protein. Lombard-Platet et al. (1996) speculated that the human gene may be a candidate for a modifier gene that accounts for some of the extreme phenotypic variability of ALD. The human ALDR gene was also a candidate for 1 of the complementation groups of Zellweger syndrome (see OMIM Ref. No. 214100), a genetically heterogeneous disorder of peroxisomal biogenesis. By isotopic in situ hybridization, Savary et al. (1997) mapped the ALDR gene to 12q11-q12 and its murine homolog to a region of homology of synteny on mouse chromosome 15. The mapping to chromosome 12 was confirmed by PCR analysis of a panel of whole genome radiation hybrids.

[14048] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14049] Lombard-Platet, G.; Savary, S.; Sarde, C.-O.; Mandel, J.-L.;

Chimini, G. : A close relative of the adrenoleukodystrophy (ALD) gene codes for a peroxisomal protein with a specific expression pattern. Proc. Nat. Acad. Sci. 93: 1265–1269, 1996. ; and

[14050] Savary, S.; Troffer–Charlier, N.; Gyapay, G.; Mattei, M.–G.; Chimini, G. : Chromosomal localization of the adrenoleukodystrophy–related gene in man and mice. Europ. J. Hum. Genet. 5: 99–.

[14051] Further studies establishing the function and utilities of ABCD2 are found in John Hopkins OMIM database record ID 601081, and in cited publications numbered 1259–126 and 8796 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Epidermal Growth Factor Receptor (erythroblastic leukemia viral (v–erb–b) Oncogene Homolog, Avian) (EGFR, Accession NM_005228) is another VGAM229 host target gene. EGFR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EGFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFR BINDING SITE, designated SEQ ID:11721, to the nucleotide sequence of VGAM229 RNA,

herein designated VGAM RNA, also designated SEQ ID:2940.

[14052] Another function of VGAM229 is therefore inhibition of Epidermal Growth Factor Receptor (erythroblastic leukemia viral (v-erb-b) Oncogene Homolog, Avian) (EGFR, Accession NM_005228), a gene which is a receptor for egf, but also for other members of the egf family. Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFR. The function of EGFR has been established by previous studies. Maternal uniparental disomy (UPD) of chromosome 7 has been reported in approximately 10% of cases of Silver-Russell syndrome (SRS; 180860). This suggests that at least 1 gene on chromosome 7 is imprinted and involved in the pathogenesis of SRS. Wakeling et al. (1998) investigated the EGFR gene as a candidate for imprinting because the gene maps to 7p12, a region homologous to an imprinted region on mouse chromosome 11. Using a restriction fragment length polymorphism, they found, however, biallelic expression of EGFR in a range of normal human fetal tissues. Expression was also demonstrated in fibroblasts and lymphoblasts from SRS patients with maternal UPD7. Thus, no

evidence that EGFR is imprinted was found, making its involvement in SRS unlikely. However, EGFR was shown to be widely expressed in the human fetus, providing evidence that it plays an important role in early development. The only gene known to be imprinted on chromosome 7 at that time was MEST, also called paternally expressed gene-1 (OMIM Ref. No. 601029), which maps to 7q32. Animal model experiments lend further support to the function of EGFR. Activation of epidermal growth factor receptor triggers mitogenic signaling in gastrointestinal mucosa, and its expression is also upregulated in colon cancers and most neoplasms. Pai et al. (2002) investigated whether prostaglandins transactivate EGFR. Pai et al. (2002) demonstrated that prostaglandin E2 (PGE2; 176804) rapidly phosphorylates EGFR and triggers the extracellular signal-regulated kinase 2 (ERK2; 176948)-mitogenic signaling pathway in normal gastric epithelial and colon cancer cell lines. Inactivation of EGFR kinase with selective inhibitors significantly reduced PGE2-induced ERK2 activation, c-fos mRNA expression, and cell proliferation. Inhibition of matrix metalloproteinases, TGFA, or c-Src (OMIM Ref. No. 190090) blocked PGE2-mediated EGFR transactivation and downstream sig-

naling, indicating that PGE2-induced EGFR transactivation involves signaling transduced via TGF-alpha, an EGFR ligand, likely released by c-Src-activated MMPs.

[14053] It is appreciated that the abovementioned animal model for EGFR is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[14054] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14055] Pai, R.; Soreghan, B.; Szabo, I. L.; Pavelka, M.; Baatar, D.; Tarnawski, A. S. : Prostaglandin E2 transactivates EGF receptor: a novel mechanism for promoting colon cancer growth and gastrointestinal hypertrophy. Nature Med. 8: 289-293, 2002. ; and

[14056] Wakeling, E. L.; Abu-Amero, S. N.; Stanier, P.; Preece, M. A.; Moore, G. E. : Human EGFR, a candidate gene for the Silver-Russell syndrome, is biallelically expressed in a wide range.

[14057] Further studies establishing the function and utilities of EGFR are found in John Hopkins OMIM database record ID 131550, and in cited publications numbered 4645-4649, 369-377, 422 and 4587-4597 listed in the bibliography

section hereinbelow, which are also hereby incorporated by refer-

ence.UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 7 (GalNAc-T7)

(GALNT7, Accession NM_017423) is another VGAM229 host target gene. GALNT7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GALNT7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALNT7 BINDING SITE, designated SEQ ID:18878, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14058] Another function of VGAM229 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 7 (GalNAc-T7) (GALNT7, Accession NM_017423). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT7. Hypoxia-inducible Factor 1, Alpha Subunit (basic helix-loop-helix transcription factor) (HIF1A, Accession NM_001530) is another VGAM229 host target gene. HIF1A BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HIF1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIF1A BINDING SITE, designated SEQ ID:7266, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14059] Another function of VGAM229 is therefore inhibition of Hypoxia-inducible Factor 1, Alpha Subunit (basic helix-loop-helix transcription factor) (HIF1A, Accession NM_001530), a gene which is a basic helix-loop-helix transcription factor and mediates transcriptional responses to hypoxia and dioxin-signaling. Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIF1A. The function of HIF1A has been established by previous studies. HIF1 has a key role in cellular response to hypoxia, including the regulation of genes involved in energy metabolism, angiogenesis, and apoptosis. The alpha subunits of HIF are rapidly degraded by the proteasome under normal conditions but are stabilized by hypoxia. Cobaltous ions or iron chelators mimic hypoxia, in-

dicating that the stimuli may interact through effects on a ferroprotein oxygen sensor. Maxwell et al. (1999) demonstrated a critical role for the von Hippel–Lindau tumor suppressor gene product VHL (OMIM Ref. No. 193300) in HIF1 regulation. In VHL-defective cells, HIF- α subunits were constitutively stabilized and HIF1 was activated. Reexpression of VHL restored oxygen-dependent instability. VHL and HIF- α subunits coimmunoprecipitated, and VHL was present in the hypoxic HIF1 DNA-binding complex. In cells exposed to iron chelation or cobaltous ions, HIF1 is dissociated from VHL. These findings indicated that the interaction between HIF1 and VHL is iron dependent and that it is necessary for the oxygen-dependent degradation of HIF- α subunits. Maxwell et al. (1999) suggested that constitutive HIF1 activation may underlie the angiogenic phenotype of VHL-associated tumors. Animal model experiments lend further support to the function of HIF1A. To investigate whether HIF1 is required for ventilatory responses to hypoxia, Kline et al. (2002) analyzed mice that were either wildtype or heterozygous for a loss-of-function (knockout) allele at the Hif1a locus. Although ventilatory response to acute hypoxia was not impaired in heterozygous Hif1a mice, the

response was primarily mediated via vagal afferents, whereas in wildtype mice, carotid body chemoreceptors played a predominant role. When carotid bodies isolated from wildtype mice were exposed to either cyanide or hypoxia, a marked increase in sinus nerve activity was recorded. In contrast, carotid bodies from heterozygous mice responded to cyanide but not to hypoxia. Histologic analysis revealed no abnormalities of carotid body morphology in heterozygous mice. Wildtype mice exposed to hypoxia for 3 days manifested an augmented ventilatory response to a subsequent acute hypoxic challenge. In contrast, prior chronic hypoxia resulted in a diminished ventilatory response to acute hypoxia in heterozygous Hif1a mice. Thus, partial HIF1A deficiency has a dramatic effect on carotid body neural activity and ventilatory adaptation to chronic hypoxia.

[14060] It is appreciated that the abovementioned animal model for HIF1A is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[14061] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [14062] Maxwell, P. H.; Wiesener, M. S.; Chang, G.-W.; Clifford, S. C.; Vaux, E. C.; Cockman, M. E.; Wykoff, C. C.; Pugh, C. W.; Maher, E. R.; Ratcliffe, P. - [14064] Further studies establishing the function and utilities of HIF1A are found in John Hopkins OMIM database record ID 603348, and in cited publications numbered 5343, 4366, 2691, 7997, 7998-8005, 436 and 8006-8008 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Multiple Endocrine Neoplasia I (MEN1, Accession XM_167804) is another VGAM229 host target gene. MEN1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MEN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEN1 BINDING SITE, designated SEQ ID:44844, to the nucleotide sequence of

VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14065] Another function of VGAM229 is therefore inhibition of Multiple Endocrine Neoplasia I (MEN1, Accession XM_167804). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEN1. Myosin IB (MYO1B, Accession NM_012223) is another VGAM229 host target gene. MYO1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYO1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYO1B BINDING SITE, designated SEQ ID:14523, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14066] Another function of VGAM229 is therefore inhibition of Myosin IB (MYO1B, Accession NM_012223). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYO1B. Transducin (beta)-like 2 (TBL2, Accession NM_012453) is another VGAM229 host target gene. TBL2

BINDING SITE1 and TBL2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TBL2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBL2 BINDING SITE1 and TBL2 BINDING SITE2, designated SEQ ID:14821 and SEQ ID:26867 respectively, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14067] Another function of VGAM229 is therefore inhibition of Transducin (beta)-like 2 (TBL2, Accession NM_012453), a gene which is of unknown function. Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBL2. The function of TBL2 has been established by previous studies. Meng et al. (1998) constructed a physical map encompassing the 1.5-Mb region of chromosome 7q11.23 that is commonly deleted in Williams-Beuren syndrome (WBS; 194050). They identified 3 genes within this region, including TBL2, which they designated WS-beta-TRP. By EST database searching, screening of a testis cDNA library, and sequencing, they cloned a TBL2 cDNA

encoding a deduced 426–amino acid protein with 4 WD (or beta–transducin) repeats. TBL2 shares approximately 40% homology with a hypothetical *C. elegans* protein, suggesting that the gene has been conserved through evolution. Northern blot analysis detected a 2.4–kb transcript in all tissues examined, with high expression in heart, brain, placenta, skeletal muscle, and pancreas. Perez Jurado et al. (1999) cloned a TBL2 cDNA from a fetal brain cDNA library and found that it encodes a deduced 447–amino acid protein with a predicted molecular mass of 49.8 kD. They also cloned the mouse ortholog, which shares 84% sequence identity with the human protein. Northern blot analysis of human tissues detected not only the 2.4–kb transcript, but an approximately 5–kb transcript which was ubiquitously expressed at lower levels. Perez Jurado et al. (1999) also identified an alternatively spliced transcript containing an additional exon (exon 2–prime) with an inframe stop codon that encodes a deduced 75–amino acid protein with 43 amino acids identical to TBL2 at the N terminus and no known functional domain.

[14068] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[14071] Further studies establishing the function and utilities of TBL2 are found in John Hopkins OMIM database record ID 605842, and in cited publications numbered 97 and 6619 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. AUT-like 1, Cysteine Endopeptidase (*S. cerevisiae*) (AUTL1, Accession NM_032852) is another VGAM229 host target gene. AUTL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AUTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AUTL1 BINDING SITE, designated SEQ

ID:26645, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14072] Another function of VGAM229 is therefore inhibition of AUT-like 1, Cysteine Endopeptidase (*S. cerevisiae*) (AUTL1, Accession NM_032852). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AUTL1. B1 (Accession NM_014451) is another VGAM229 host target gene. B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B1 BINDING SITE, designated SEQ ID:15800, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14073] Another function of VGAM229 is therefore inhibition of B1 (Accession NM_014451). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B1. BCL2-associated Athanogene 5 (BAG5, Accession NM_004873) is another VGAM229 host target gene. BAG5

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BAG5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAG5 BINDING SITE, designated SEQ ID:11305, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14074] Another function of VGAM229 is therefore inhibition of BCL2-associated Athanogene 5 (BAG5, Accession NM_004873). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAG5. CDK5 Regulatory Subunit Associated Protein 3 (CDK5RAP3, Accession NM_025197) is another VGAM229 host target gene. CDK5RAP3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CDK5RAP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDK5RAP3 BINDING SITE, designated SEQ ID:24851, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ

ID:2940.

[14075] Another function of VGAM229 is therefore inhibition of CDK5 Regulatory Subunit Associated Protein 3 (CDK5RAP3, Accession NM_025197). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDK5RAP3. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 28 (DDX28, Accession NM_018380) is another VGAM229 host target gene. DDX28 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DDX28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX28 BINDING SITE, designated SEQ ID:20410, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14076] Another function of VGAM229 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 28 (DDX28, Accession NM_018380). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX28. DKFZP434L187 (Accession XM_044070) is another

VGAM229 host target gene. DKFZP434L187 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434L187, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434L187 BINDING SITE, designated SEQ ID:34117, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14077] Another function of VGAM229 is therefore inhibition of DKFZP434L187 (Accession XM_044070). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434L187. FLJ13322 (Accession NM_024722) is another VGAM229 host target gene. FLJ13322 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ13322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13322 BINDING SITE, designated SEQ ID:24059, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14078] Another function of VGAM229 is therefore inhibition of FLJ13322 (Accession NM_024722). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13322. FLJ14564 (Accession XM_084459) is another VGAM229 host target gene. FLJ14564 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14564, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14564 BINDING SITE, designated SEQ ID:37593, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14079] Another function of VGAM229 is therefore inhibition of FLJ14564 (Accession XM_084459). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14564. FLJ20086 (Accession NM_017661) is another VGAM229 host target gene. FLJ20086 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20086, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20086 BINDING SITE, designated SEQ ID:19188, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14080] Another function of VGAM229 is therefore inhibition of FLJ20086 (Accession NM_017661). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20086. FLJ20445 (Accession NM_017824) is another VGAM229 host target gene. FLJ20445 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20445 BINDING SITE, designated SEQ ID:19480, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14081] Another function of VGAM229 is therefore inhibition of FLJ20445 (Accession NM_017824). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20445.

G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM_139201) is another VGAM229 host target gene. GIT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GIT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GIT2 BINDING SITE, designated SEQ ID:29212, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14082] Another function of VGAM229 is therefore inhibition of G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM_139201). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GIT2. H2A Histone Family, Member J (H2AFJ, Accession NM_018267) is another VGAM229 host target gene. H2AFJ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by H2AFJ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H2AFJ BINDING SITE, designated SEQ ID:20236, to the nucleotide se-

quence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14083] Another function of VGAM229 is therefore inhibition of H2A Histone Family, Member J (H2AFJ, Accession NM_018267). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H2AFJ. NPD009 (Accession XM_170795) is another VGAM229 host target gene. NPD009 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NPD009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPD009 BINDING SITE, designated SEQ ID:45562, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14084] Another function of VGAM229 is therefore inhibition of NPD009 (Accession XM_170795). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPD009. Oxysterol Binding Protein-like 2 (OSBPL2, Accession NM_144498) is another VGAM229 host target gene. OS-

BPL2 BINDING SITE1 and OSBPL2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OSBPL2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL2 BINDING SITE1 and OSBPL2 BINDING SITE2, designated SEQ ID:29317 and SEQ ID:16849 respectively, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14085] Another function of VGAM229 is therefore inhibition of Oxysterol Binding Protein-like 2 (OSBPL2, Accession NM_144498). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL2. Ubiquitin-conjugating Enzyme E2G 1 (UBC7 homolog, *C. elegans*) (UBE2G1, Accession NM_003342) is another VGAM229 host target gene. UBE2G1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE2G1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2G1 BINDING SITE,

designated SEQ ID:9348, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14086] Another function of VGAM229 is therefore inhibition of Ubiquitin-conjugating Enzyme E2G 1 (UBC7 homolog, *C. elegans*) (UBE2G1, Accession NM_003342). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2G1. LOC133418 (Accession XM_059649) is another VGAM229 host target gene. LOC133418 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC133418, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133418 BINDING SITE, designated SEQ ID:37037, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14087] Another function of VGAM229 is therefore inhibition of LOC133418 (Accession XM_059649). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133418. LOC143098 (Accession XM_084421) is an-

other VGAM229 host target gene. LOC143098 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC143098, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143098 BINDING SITE, designated SEQ ID:37575, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14088] Another function of VGAM229 is therefore inhibition of LOC143098 (Accession XM_084421). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143098. LOC145622 (Accession XM_085186) is another VGAM229 host target gene. LOC145622 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145622 BINDING SITE, designated SEQ ID:37910, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14089] Another function of VGAM229 is therefore inhibition of LOC145622 (Accession XM_085186). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145622. LOC148195 (Accession XM_097419) is another VGAM229 host target gene. LOC148195 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148195 BINDING SITE, designated SEQ ID:40872, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14090] Another function of VGAM229 is therefore inhibition of LOC148195 (Accession XM_097419). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148195. LOC221510 (Accession XM_165807) is another VGAM229 host target gene. LOC221510 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221510, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221510 BINDING SITE, designated SEQ ID:43769, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:2940.

[14091] Another function of VGAM229 is therefore inhibition of LOC221510 (Accession XM_165807). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221510. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 230 (VGAM230) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14092] VGAM230 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM230 was detected is described hereinabove with reference to Figs. 1–8.

[14093] VGAM230 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM230 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[14094] VGAM230 gene encodes a VGAM230 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM230 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM230 precursor RNA is designated SEQ ID:216, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:216 is located at position 57457 relative to the genome of Calitrichine Herpesvirus 3.

[14095] VGAM230 precursor RNA folds onto itself, forming VGAM230 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14096] An enzyme complex designated DICER COMPLEX, `dices` the VGAM230 folded precursor RNA into VGAM230 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM230 RNA is designated SEQ ID:2941, and is provided hereinbelow with reference to the sequence listing part.

[14097] VGAM230 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM230 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM230 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[14098] VGAM230 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM230 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM230 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM230 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM230 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[14099] The complementary binding of VGAM230 RNA, herein designated VGAM RNA, to host target binding sites on VGAM230 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM230 host target RNA into VGAM230 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[14100] It is appreciated that VGAM230 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM230 host target genes. The mRNA of each one of this plurality of VGAM230 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM230 RNA, herein designated VGAM RNA, and which when bound by VGAM230 RNA causes inhibition of translation of respective one or more VGAM230 host target proteins.

[14101] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM230 gene, herein designated VGAM GENE, on one or more VGAM230 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[14102] It is yet further appreciated that a function of VGAM230 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of viral infection by Callicitricine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM230 correlate with, and may be deduced from, the identity of the host target genes which VGAM230 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14103] Nucleotide sequences of the VGAM230 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM230 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM230 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM230 are further described hereinbelow with reference to Table 1.

[14104] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM230 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM230 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14105] As mentioned hereinabove with reference to Fig. 1, a function of VGAM230 gene, herein designated VGAM is inhibition of expression of VGAM230 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM230 correlate with, and may be deduced from, the identity of the target genes which VGAM230 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14106] Ciliary Neurotrophic Factor Receptor (CNTFR, Accession NM_001842) is a VGAM230 host target gene. CNTFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNTFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNTFR BINDING SITE, designated SEQ ID:7577, to the nucleotide sequence of VGAM230 RNA, herein designated

VGAM RNA, also designated SEQ ID:2941.

[14107] A function of VGAM230 is therefore inhibition of Ciliary Neurotrophic Factor Receptor (CNTFR, Accession NM_001842), a gene which is critical for the developing nervous system. Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNTFR. The function of CNTFR has been established by previous studies. Davis et al. (1991) used the 'tagged-ligand panning' procedure to clone a receptor for ciliary neurotrophic factor (OMIM Ref. No. 118945). This receptor is expressed exclusively in the nervous system and skeletal muscle. The CNTF receptor was found to have a structure unrelated to the receptors utilized by the nerve growth factor family of neurotrophic molecules, but instead is most homologous to the receptor for a cytokine, interleukin-6 (IL6; 147620). This similarity suggested that the CNTF receptor, like the IL6 receptor, requires a second, signal-transducing component. In contrast to all known receptors, the CNTF receptor is anchored to cell membranes by a glycosylphosphatidylinositol linkage. Donaldson et al. (1993) mapped the CNTFR gene to chromosome 9 by PCR on a panel of human/CHO somatic cell hybrids and regional-

ized the assignment to 9p13 by PCR on a panel of radiation hybrids. By interspecific backcross linkage analysis, Pilz et al. (1995) mapped the *Cntfr* gene to mouse chromosome 4. By fluorescence in situ hybridization, Valenzuela et al. (1995) mapped the *CNTFR* gene to 9p13, and by interspecific backcross linkage analysis, they mapped the gene to mouse chromosome 4 in a region of known homology of synteny to 9p. Valenzuela et al. (1995) found that the human and mouse genes have an identical intron/exon structure that correlates well with the domain structure of the protein. The signal peptide and the immunoglobulin-like domain are each encoded by a single exon, the cytokine receptor-like domain is distributed among 4 exons, and the C-terminal glycosylphosphatidylinositol recognition domain is encoded by the final coding exon. The position of the introns within the cytokine receptor-like domain corresponds to that found in other members of the cytokine receptor superfamily.

[14108] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14109] Davis, S.; Aldrich, T. H.; Valenzuela, D. M.; Wong, V.; Furth, M. E.; Squinto, S. P.; Yancopoulos, G. D. : The re-

ceptor for ciliary neurotrophic factor. Science 253: 59–63, 1991. ; and

[14110] Pilz, A.; Woodward, K.; Povey, S.; Abbott, C. : Comparative mapping of 50 human chromosome 9 loci in the laboratory mouse. Genomics 25: 139–149, 1995.

[14111] Further studies establishing the function and utilities of CNTFR are found in John Hopkins OMIM database record ID 118946, and in cited publications numbered 1462, 146 and 1464 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Desmocollin 3 (DSC3, Accession NM_001941) is another VGAM230 host target gene. DSC3 BINDING SITE1 and DSC3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DSC3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSC3 BINDING SITE1 and DSC3 BINDING SITE2, designated SEQ ID:7654 and SEQ ID:23665 respectively, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:2941.

[14112] Another function of VGAM230 is therefore inhibition of Desmocollin 3 (DSC3, Accession NM_001941), a gene

which is a component of intercellular desmosome junctions. Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSC3. The function of DSC3 has been established by previous studies. From a bladder carcinoma cell line cDNA library, Kawamura et al. (1994) cloned a human cDNA encoding for a novel transmembrane protein. Sequence analysis revealed an open reading frame of 2,691 bp encoding a protein of 896 amino acids. Sequence comparisons showed significant homology to desmocollins, intercellular adhesion molecules belonging to the cadherin superfamily. The protein consisted of a signal peptide of 30 amino acids, a precursor segment of 105 amino acids, and a mature protein of 761 amino acids. Antibodies recognizing the predicted mature adhesion molecule of the protein stained antigens along the cell boundaries of normal human keratinocytes resembling the pattern of desmosome localization. Kawamura et al. (1994) concluded that the clone represented a new member of the desmocollin family and tentatively referred to it as desmocollin type 4. King et al. (1995) used the designation DSC3 for a gene encoding a desmocollin present in human foreskin epidermis and stated that the

gene is identical to that encoding the desmocollin isolated from a bladder carcinoma cell line and called DSC4 by Kawamura et al. (1994). They likewise mapped the gene to chromosome 18 by PCR analysis of rodent/human somatic cell hybrids. They stated that the cDNA sequence showed 67% amino acid identity with the original human desmocollin, designated DSC2, and 52% amino acid identity with DSC1. By in situ hybridization studies, they showed that DSC1 was not present in any of the nonkeratinizing human epithelia, such as buccal mucosa, cervix, and esophagus, whereas all these internal epithelia expressed DSC2 and DSC3 and were present in most of the living layers of tissues, including the basal layers.

[14113] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14114] Kawamura, K.; Watanabe, K.; Suzuki, T.; Yamakawa, T.; Kamiyama, T.; Nakagawa, H.; Tsurufuji, S. : cDNA cloning and expression of a novel human desmocollin. J. Biol. Chem. 269: 26295–26302, 1994. ; and

pression p.

[14116] Further studies establishing the function and utilities of DSC3 are found in John Hopkins OMIM database record ID 600271, and in cited publications numbered 7347–7349 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protocadherin Alpha 9 (PCDHA9, Accession NM_014005) is another VGAM230 host target gene. PCDHA9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA9 BINDING SITE, designated SEQ ID:15209, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:2941.

[14117] Another function of VGAM230 is therefore inhibition of Protocadherin Alpha 9 (PCDHA9, Accession NM_014005), a gene which is a calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA9. The function of PCDHA9 and its association with various diseases and clinical con-

ditions, has been established by previous studies, as described hereinabove with reference to VGAM71.RPP30 (Accession NM_006413) is another VGAM230 host target gene. RPP30 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPP30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPP30 BINDING SITE, designated SEQ ID:13124, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:2941.

[14118] Another function of VGAM230 is therefore inhibition of RPP30 (Accession NM_006413), a gene which is a component of ribonuclease p that processes 5' ends of precursor tRNAs. Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPP30. The function of RPP30 has been established by previous studies. By biochemical purification of RNase P, micropeptide sequence analysis, and EST database searching, Eder et al. (1997) obtained a cDNA encoding RPP30. The deduced protein contains 268 amino acids with a predicted molecular mass of nearly 30

kD. Jarrous et al. (1998) determined that RPP30 is a target for antisera from systemic sclerosis patients. Immunoprecipitation analysis showed that polyclonal antibodies raised against RPP20, RPP30, RPP38, or RPP40 interact with RNase P from HeLa cells.

[14119] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14120] Eder, P. S.; Kekuda, R.; Stolc, V.; Altman, S. : Characterization of two scleroderma autoimmune antigens that copurify with human ribonuclease P. Proc. Nat. Acad. Sci. 94: 1101-1106, 1997. ; and

[14121] Jarrous, N.; Eder, P. S.; Guerrier-Takada, C.; Hoog, C.; Altman, S. : Autoantigenic properties of some protein subunits of catalytically active complexes of human ribonuclease P. RNA 4: 407.

[14122] Further studies establishing the function and utilities of RPP30 are found in John Hopkins OMIM database record ID 606115, and in cited publications numbered 74 and 897 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. AFAP (Accession NM_021638) is another VGAM230 host target gene. AFAP BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by AFAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AFAP BINDING SITE, designated SEQ ID:22291, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:2941.

[14123] Another function of VGAM230 is therefore inhibition of AFAP (Accession NM_021638). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AFAP. FLJ10583 (Accession NM_018148) is another VGAM230 host target gene. FLJ10583 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10583, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10583 BINDING SITE, designated SEQ ID:19950, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:2941.

[14124] Another function of VGAM230 is therefore inhibition of FLJ10583 (Accession NM_018148). Accordingly, utilities of

VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10583. FLJ20208 (Accession NM_017712) is another VGAM230 host target gene. FLJ20208 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20208, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20208 BINDING SITE, designated SEQ ID:19292, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:2941.

[14125] Another function of VGAM230 is therefore inhibition of FLJ20208 (Accession NM_017712). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20208. FLJ23519 (Accession NM_032240) is another VGAM230 host target gene. FLJ23519 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23519, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23519 BINDING SITE,

designated SEQ ID:25977, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:2941.

[14126] Another function of VGAM230 is therefore inhibition of FLJ23519 (Accession NM_032240). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23519. TADA3L (Accession NM_133480) is another VGAM230 host target gene. TADA3L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TADA3L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TADA3L BINDING SITE, designated SEQ ID:28548, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:2941.

[14127] Another function of VGAM230 is therefore inhibition of TADA3L (Accession NM_133480). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TADA3L. Ubiquitin Specific Protease 24 (USP24, Accession XM_165973) is another VGAM230 host target gene. USP24

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by USP24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP24 BINDING SITE, designated SEQ ID:43817, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:2941.

[14128] Another function of VGAM230 is therefore inhibition of Ubiquitin Specific Protease 24 (USP24, Accession XM_165973). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP24. LOC118987 (Accession XM_058361) is another VGAM230 host target gene. LOC118987 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC118987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118987 BINDING SITE, designated SEQ ID:36607, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:2941.

[14129] Another function of VGAM230 is therefore inhibition of LOC118987 (Accession XM_058361). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118987. LOC138046 (Accession XM_059936) is another VGAM230 host target gene. LOC138046 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC138046, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138046 BINDING SITE, designated SEQ ID:37115, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:2941.

[14130] Another function of VGAM230 is therefore inhibition of LOC138046 (Accession XM_059936). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138046. LOC147178 (Accession XM_028755) is another VGAM230 host target gene. LOC147178 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147178, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147178 BINDING SITE, designated SEQ ID:30742, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:2941.

[14131] Another function of VGAM230 is therefore inhibition of LOC147178 (Accession XM_028755). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147178. LOC147991 (Accession XM_085993) is another VGAM230 host target gene. LOC147991 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147991, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147991 BINDING SITE, designated SEQ ID:38436, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:2941.

[14132] Another function of VGAM230 is therefore inhibition of LOC147991 (Accession XM_085993). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC147991. LOC155434 (Accession XM_098723) is another VGAM230 host target gene. LOC155434 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155434, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155434 BINDING SITE, designated SEQ ID:41771, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:2941.

[14133] Another function of VGAM230 is therefore inhibition of LOC155434 (Accession XM_098723). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155434. LOC199699 (Accession XM_113990) is another VGAM230 host target gene. LOC199699 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199699, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199699 BINDING SITE, designated SEQ ID:42597, to the nucleotide sequence of VGAM230 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2941.

[14134] Another function of VGAM230 is therefore inhibition of LOC199699 (Accession XM_113990). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199699. LOC93048 (Accession XM_048903) is another VGAM230 host target gene. LOC93048 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93048, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93048 BINDING SITE, designated SEQ ID:35295, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:2941.

[14135] Another function of VGAM230 is therefore inhibition of LOC93048 (Accession XM_048903). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93048. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 231 (VGAM231) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14136] VGAM231 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM231 was detected is described hereinabove with reference to Figs. 1–8.

[14137] VGAM231 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM231 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14138] VGAM231 gene encodes a VGAM231 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM231 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM231 precursor RNA is designated SEQ ID:217, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:217 is located at position 73231 relative to the genome of Callitrichine Herpesvirus 3.

[14139] VGAM231 precursor RNA folds onto itself, forming

VGAM231 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14140] An enzyme complex designated DICER COMPLEX, `dices` the VGAM231 folded precursor RNA into VGAM231 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM231 RNA is designated SEQ ID:2942, and is provided hereinbelow with reference to the sequence listing part.

[14141] VGAM231 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM231 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM231 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[14142] VGAM231 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM231 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM231 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM231 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM231 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[14143] The complementary binding of VGAM231 RNA, herein designated VGAM RNA, to host target binding sites on VGAM231 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM231 host target RNA into VGAM231 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14144] It is appreciated that VGAM231 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM231 host target genes. The mRNA of each one of this plurality of VGAM231 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM231 RNA, herein designated VGAM RNA, and which when bound by VGAM231 RNA causes inhibition of translation of respective one or more VGAM231 host target proteins.

[14145] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM231 gene, herein designated VGAM GENE, on one or more VGAM231 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[14146] It is yet further appreciated that a function of VGAM231 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM231 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM231 correlate with, and may be deduced from, the identity of the host target genes which VGAM231 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[14147] Nucleotide sequences of the VGAM231 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM231 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM231 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM231 are further described hereinbelow with reference to Table 1.

[14148] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM231 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM231 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14149] As mentioned hereinabove with reference to Fig. 1, a function of VGAM231 gene, herein designated VGAM is inhibition of expression of VGAM231 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM231 correlate with, and may be deduced from, the identity of the target genes which VGAM231 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[14150] Amyloid Beta (A4) Precursor-like Protein 2 (APLP2, Accession XM_165592) is a VGAM231 host target gene. APLP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APLP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APLP2 BINDING SITE, designated SEQ ID:43699, to the nucleotide sequence of VGAM231 RNA, herein designated VGAM RNA, also designated SEQ ID:2942.

[14151] A function of VGAM231 is therefore inhibition of Amyloid Beta (A4) Precursor-like Protein 2 (APLP2, Accession XM_165592), a gene which may play a role in the regulation of hemostasis. Accordingly, utilities of VGAM231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APLP2. The function of APLP2 has been established by previous studies. Yan et al. (1990) cloned a cDNA that encoded a human sperm membrane protein identified by a monoclonal antibody raised against this protein and designated YWK-II. They found that the deduced polypeptide contains a segment with high homology to the transmembrane-cytoplasmic do-

mains of the A4 amyloid protein (APP; 104760) found in brain plaques of Alzheimer disease patients. Rather than the lys-lys-lys sequence found in the A4 protein, an arg-lys-arg sequence was found at the probable membrane-cytoplasmic junction that may represent a unique property of sperm membrane proteins. The human amyloid precursor-like protein APLP2 is a highly conserved homolog of a sequence-specific DNA-binding mouse protein with an important function in the cell cycle. The mouse amyloid precursor-like protein Aplp1 has 42% sequence identity to mouse App; the human homolog of APLP1 (OMIM Ref. No. 104775) maps to 19q11-q13.2 (Wasco et al., 1993). By study of somatic cell hybrids segregating human chromosomes, von der Kammer et al. (1994) mapped the APLP2 gene to chromosome 11; by fluorescence in situ hybridization, the assignment was confirmed and further localized to 11q23-q25. By FISH, Leach et al. (1999) mapped the gene to 11q24.

[14152] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14153] Wasco, W.; Brook, J. D.; Tanzi, R. E. : The amyloid precursor-like protein (APLP) gene maps to the long arm of hu-

- man chromosome 19. Genomics 15: 237–239, 1993. ; and
- [14154] Yan, Y. C.; Bai, Y.; Wang, L.; Miao, S.; Koide, S. S. : Characterization of cDNA encoding a human sperm membrane protein related to A4 amyloid protein. Proc. Nat. Acad. Sci. 87: 2405–240.
- [14155] Further studies establishing the function and utilities of APLP2 are found in John Hopkins OMIM database record ID 104776, and in cited publications numbered 4310–4312, 430 and 4313–4314 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Apical Protein–like (*Xenopus laevis*) (APXL, Accession NM_001649) is another VGAM231 host target gene. APXL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by APXL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APXL BINDING SITE, designated SEQ ID:7351, to the nucleotide sequence of VGAM231 RNA, herein designated VGAM RNA, also designated SEQ ID:2942.
- [14156] Another function of VGAM231 is therefore inhibition of Apical Protein–like (*Xenopus laevis*) (APXL, Accession NM_001649), a gene which is implicated in amiloride–sen–

sitive sodium channel activity. Accordingly, utilities of VGAM231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APXL. The function of APXL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152. Collagen, Type I, Alpha 2 (COL1A2, Accession NM_000089) is another VGAM231 host target gene. COL1A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COL1A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL1A2 BINDING SITE, designated SEQ ID:5542, to the nucleotide sequence of VGAM231 RNA, herein designated VGAM RNA, also designated SEQ ID:2942.

[14157] Another function of VGAM231 is therefore inhibition of Collagen, Type I, Alpha 2 (COL1A2, Accession NM_000089). Accordingly, utilities of VGAM231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL1A2. Fucosyltransferase 6 (alpha (1,3) Fucosyltransferase) (FUT6, Accession

NM_000150) is another VGAM231 host target gene. FUT6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FUT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUT6 BINDING SITE, designated SEQ ID:5651, to the nucleotide sequence of VGAM231 RNA, herein designated VGAM RNA, also designated SEQ ID:2942.

[14158] Another function of VGAM231 is therefore inhibition of Fucosyltransferase 6 (alpha (1,3) Fucosyltransferase) (FUT6, Accession NM_000150), a gene which is involved in the biosynthesis of the e-selectin ligand, sialyl-lewis x. catalyzes the transfer of fucose from gdp- beta-fucose to alpha-2,3 sialylated substrates. Accordingly, utilities of VGAM231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT6. The function of FUT6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM194.JJAZ1 (Accession NM_015355) is another VGAM231 host target gene. JJAZ1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by JJAZ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JJAZ1 BINDING SITE, designated SEQ ID:17654, to the nucleotide sequence of VGAM231 RNA, herein designated VGAM RNA, also designated SEQ ID:2942.

[14159] Another function of VGAM231 is therefore inhibition of JJAZ1 (Accession NM_015355), a gene which is a zinc finger protein. Accordingly, utilities of VGAM231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JJAZ1. The function of JJAZ1 has been established by previous studies. Nagase et al. (1995) deduced the sequence of a full-length cDNA clone from cell line KG-1, which they designated KIAA0160, encoding a predicted 803-amino acid protein. Northern blot analysis revealed expression in all tissues tested. A variety of cytogenetic abnormalities involving chromosome 7 have been reported in endometrial stromal sarcomas, including a recurrent t(7;17)(p15;q21). Koontz et al. (2001) identified 2 zinc finger genes, which they termed JAZF1 (OMIM Ref. No. 606246) and JJAZ1, at the sites of the 7p15 and 17q21 breakpoints, respectively. Analyses of

tumor RNA indicated that a JAZF1/JJAZ1 fusion was present in all types of endometrial stromal tumors; however, the fusion appeared to be rarer among endometrial stromal sarcomas that would be considered high-grade according to certain classification schemes

[14160] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14161] Koontz, J. I.; Soreng, A. L.; Nucci, M.; Kuo, F. C.; Pauwels, P.; van den Berghe, H.; Cin, P. D.; Fletcher, J. A.; Sklar, J. : Frequent fusion of the JAZF1 and JJAZ1 genes in endometrial stromal tumors. Proc. Nat. Acad. Sci. 98: 6348–6353, 2001. ; and

[14162] Nagase, T.; Seki, N.; Tanaka, A.; Ishikawa, K.; Nomura, N. : Prediction of the coding sequences of unidentified human genes. IV. The coding sequences of 40 new genes (KIAA0121–KIAA0160).

[14163] Further studies establishing the function and utilities of JJAZ1 are found in John Hopkins OMIM database record ID 606245, and in cited publications numbered 613 and 10969 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Tyrosine Phosphatase, Receptor-type, Z Polypeptide 1

(PTPRZ1, Accession NM_002851) is another VGAM231 host target gene. PTPRZ1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTPRZ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRZ1 BINDING SITE, designated SEQ ID:8745, to the nucleotide sequence of VGAM231 RNA, herein designated VGAM RNA, also designated SEQ ID:2942.

[14164] Another function of VGAM231 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor-type, Z Polypeptide 1 (PTPRZ1, Accession NM_002851), a gene which may be involved in the regulation of specific developmental processes in the CNS. Accordingly, utilities of VGAM231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRZ1. The function of PTPRZ1 has been established by previous studies. Phosphorylation of proteins on tyrosine residues plays a key role in the signaling of cell growth, differentiation, and transformation. The net phosphorylation of cellular proteins on tyrosine residues is controlled by the balanced action of protein-tyrosine kinases and protein-tyrosine

phosphatases present in the cell. Levy et al. (1993) isolated cDNA clones and deduced the complete amino acid sequence of a large receptor-type protein tyrosine phosphatase containing 2,307 amino acids. They found that the protein, designated PTP-zeta (PTPRZ), is a transmembrane protein with 2 cytoplasmic PTPase domains and a 1,616-amino acid extracellular domain. As in PTP-gamma (OMIM Ref. No. 176886), the 266 N-terminal residues of the extracellular domain are homologous to carbonic anhydrases (see OMIM Ref. No. 114880). The human gene encoding PTPRZ was mapped to chromosome 7 by analysis of rodent-human hybrids and was regionalized to 7q31.3-q32 by chromosomal in situ hybridization. Northern blot analysis showed that PTP-zeta is expressed only in the central nervous system. By in situ hybridization, Levy et al. (1993) localized the expression to different regions of the adult brain, including the Purkinje cell layer of the cerebellum, the dentate gyrus, and the subependymal layer of the anterior horn of the lateral ventricle. They stated that this was the first mammalian tyrosine phosphatase whose expression is restricted to the nervous system. High levels of expression in the embryonic brain suggested an important role in CNS development. Ariyama

et al. (1995) localized the PTPRZ gene to 7q31.3 by somatic cell hybrid mapping and fluorescence in situ hybridization. Animal model experiments lend further support to the function of PTPRZ1. Harroch et al. (2002) examined the susceptibility of mice deficient in Pprz to experimental autoimmune encephalomyelitis (EAE), a model of multiple sclerosis (OMIM Ref. No. 126200). They observed that mice deficient in Ptporz showed impaired recovery from EAE induced by myelin-oligodendrocyte glycoprotein (MOG; 159465) peptide. This sustained paralysis was associated with increased apoptosis of mature oligodendrocytes in the spinal cords of mutant mice at the peak of inflammation. They further demonstrated that expression of PTPRZ1, the human homolog, is induced in multiple sclerosis lesions and that the gene is specifically expressed in remyelinating oligodendrocytes in these lesions. These reports support a role for Ptporz in oligodendrocyte survival and in recovery from demyelinating disease.

[14165] It is appreciated that the abovementioned animal model for PTPRZ1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

- [14166] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [14167] Ariyama, T.; Hasegawa, K.; Inazawa, J.; Mizuno, K.; Ogi-moto, M.; Katagiri, T.; Yakura, H. : Assignment of the human protein tyrosine phosphatase, receptor-type, zeta (PTPRZ) gene to chromosome band 7q31.3. *Cytogenet. Cell Genet.* 70: 52–54, 1995. ; and
- [14168] Harroch, S.; Furtado, G. C.; Brueck, W.; Rosenbluth, J.; Lafaille, J.; Chao, M.; Buxbaum, J. D.; Schlessinger, J. : A critical role for the protein tyrosine phosphatase receptor type Z i.
- [14169] Further studies establishing the function and utilities of PTPRZ1 are found in John Hopkins OMIM database record ID 176891, and in cited publications numbered 1058 and 11262 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Rho Guanine Nucleotide Exchange Factor (GEF) 15 (ARHGEF15, Accession NM_014958) is another VGAM231 host target gene. ARHGEF15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARHGEF15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF15 BINDING SITE, designated SEQ ID:17316, to the nucleotide sequence of VGAM231 RNA, herein designated VGAM RNA, also designated SEQ ID:2942.

[14170] Another function of VGAM231 is therefore inhibition of Rho Guanine Nucleotide Exchange Factor (GEF) 15 (ARHGEF15, Accession NM_014958). Accordingly, utilities of VGAM231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF15. Death Associated Transcription Factor 1 (DATF1, Accession NM_022105) is another VGAM231 host target gene. DATF1 BINDING SITE1 and DATF1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DATF1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DATF1 BINDING SITE1 and DATF1 BINDING SITE2, designated SEQ ID:22651 and SEQ ID:28062 respectively, to the nucleotide sequence of VGAM231 RNA, herein designated VGAM RNA, also designated SEQ ID:2942.

[14171] Another function of VGAM231 is therefore inhibition of

Death Associated Transcription Factor 1 (DATF1, Accession NM_022105). Accordingly, utilities of VGAM231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DATF1. DKFZp761B0514 (Accession NM_032289) is another VGAM231 host target gene. DKFZp761B0514 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761B0514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761B0514 BINDING SITE, designated SEQ ID:26051, to the nucleotide sequence of VGAM231 RNA, herein designated VGAM RNA, also designated SEQ ID:2942.

[14172] Another function of VGAM231 is therefore inhibition of DKFZp761B0514 (Accession NM_032289). Accordingly, utilities of VGAM231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761B0514. Family with Sequence Similarity 3, Member C (FAM3C, Accession NM_014888) is another VGAM231 host target gene. FAM3C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by FAM3C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FAM3C BINDING SITE, designated SEQ ID:17039, to the nucleotide sequence of VGAM231 RNA, herein designated VGAM RNA, also designated SEQ ID:2942.

[14173] Another function of VGAM231 is therefore inhibition of Family with Sequence Similarity 3, Member C (FAM3C, Accession NM_014888). Accordingly, utilities of VGAM231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAM3C. FLJ20337 (Accession NM_017772) is another VGAM231 host target gene. FLJ20337 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20337 BINDING SITE, designated SEQ ID:19394, to the nucleotide sequence of VGAM231 RNA, herein designated VGAM RNA, also designated SEQ ID:2942.

[14174] Another function of VGAM231 is therefore inhibition of

FLJ20337 (Accession NM_017772). Accordingly, utilities of VGAM231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20337. Fucosyltransferase 10 (alpha (1,3) Fucosyltransferase) (FUT10, Accession NM_032664) is another VGAM231 host target gene. FUT10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FUT10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUT10 BINDING SITE, designated SEQ ID:26393, to the nucleotide sequence of VGAM231 RNA, herein designated VGAM RNA, also designated SEQ ID:2942.

[14175] Another function of VGAM231 is therefore inhibition of Fucosyltransferase 10 (alpha (1,3) Fucosyltransferase) (FUT10, Accession NM_032664). Accordingly, utilities of VGAM231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT10. HEF1 (Accession NM_006403) is another VGAM231 host target gene. HEF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HEF1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEF1 BINDING SITE, designated SEQ ID:13112, to the nucleotide sequence of VGAM231 RNA, herein designated VGAM RNA, also designated SEQ ID:2942.

[14176] Another function of VGAM231 is therefore inhibition of HEF1 (Accession NM_006403). Accordingly, utilities of VGAM231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEF1. KIAA0903 (Accession XM_049251) is another VGAM231 host target gene. KIAA0903 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0903, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0903 BINDING SITE, designated SEQ ID:35367, to the nucleotide sequence of VGAM231 RNA, herein designated VGAM RNA, also designated SEQ ID:2942.

[14177] Another function of VGAM231 is therefore inhibition of KIAA0903 (Accession XM_049251). Accordingly, utilities of VGAM231 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0903. MBLL39 (Accession NM_144778) is another VGAM231 host target gene. MBLL39 BINDING SITE1 and MBLL39 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MBLL39, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBLL39 BINDING SITE1 and MBLL39 BINDING SITE2, designated SEQ ID:29577 and SEQ ID:12320 respectively, to the nucleotide sequence of VGAM231 RNA, herein designated VGAM RNA, also designated SEQ ID:2942.

[14178] Another function of VGAM231 is therefore inhibition of MBLL39 (Accession NM_144778). Accordingly, utilities of VGAM231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBLL39. LOC145241 (Accession XM_031799) is another VGAM231 host target gene. LOC145241 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145241, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of LOC145241 BINDING SITE, designated SEQ ID:31483, to the nucleotide sequence of VGAM231 RNA, herein designated VGAM RNA, also designated SEQ ID:2942.

[14179] Another function of VGAM231 is therefore inhibition of LOC145241 (Accession XM_031799). Accordingly, utilities of VGAM231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145241. LOC157503 (Accession XM_098767) is another VGAM231 host target gene. LOC157503 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157503, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157503 BINDING SITE, designated SEQ ID:41811, to the nucleotide sequence of VGAM231 RNA, herein designated VGAM RNA, also designated SEQ ID:2942.

[14180] Another function of VGAM231 is therefore inhibition of LOC157503 (Accession XM_098767). Accordingly, utilities of VGAM231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157503. LOC163231 (Accession XM_092094) is an-

other VGAM231 host target gene. LOC163231 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163231 BINDING SITE, designated SEQ ID:40094, to the nucleotide sequence of VGAM231 RNA, herein designated VGAM RNA, also designated SEQ ID:2942.

[14181] Another function of VGAM231 is therefore inhibition of LOC163231 (Accession XM_092094). Accordingly, utilities of VGAM231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163231. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 232 (VGAM232) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14182] VGAM232 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM232 was detected is described

hereinabove with reference to Figs. 1–8.

[14183] VGAM232 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM232 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14184] VGAM232 gene encodes a VGAM232 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM232 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM232 precursor RNA is designated SEQ ID:218, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:218 is located at position 121062 relative to the genome of Callitrichine Herpesvirus 3.

[14185] VGAM232 precursor RNA folds onto itself, forming VGAM232 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14186] An enzyme complex designated DICER COMPLEX, `dices` the VGAM232 folded precursor RNA into VGAM232 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM232 RNA is designated SEQ ID:2943, and is provided hereinbelow with reference to the sequence listing part.

[14187] VGAM232 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM232 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM232 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[14188] VGAM232 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM232 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM232 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM232 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM232 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[14189] The complementary binding of VGAM232 RNA, herein designated VGAM RNA, to host target binding sites on VGAM232 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM232 host target RNA into VGAM232 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14190] It is appreciated that VGAM232 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM232 host target genes. The mRNA of each one of this plurality of VGAM232 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM232 RNA, herein designated VGAM RNA, and which when bound by VGAM232 RNA causes inhibition of translation of respective one or more VGAM232 host target proteins.

[14191] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM232 gene, herein designated VGAM GENE, on one or more VGAM232 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[14192] It is yet further appreciated that a function of VGAM232 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM232 correlate with, and may be deduced from, the identity of the host target genes which VGAM232 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14193] Nucleotide sequences of the VGAM232 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM232 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM232 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM232 are further described hereinbelow with reference to Table 1.

[14194] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM232 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM232 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14195] As mentioned hereinabove with reference to Fig. 1, a function of VGAM232 gene, herein designated VGAM is inhibition of expression of VGAM232 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM232 correlate with, and may be deduced from, the identity of the target genes which VGAM232 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14196] Arylsulfatase D (ARSD, Accession NM_009589) is a VGAM232 host target gene. ARSD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARSD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARSD BINDING SITE, designated SEQ ID:14317, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14197] A function of VGAM232 is therefore inhibition of Arylsulfatase D (ARSD, Accession NM_009589), a gene which hydrolyzes sulfate groups from sugar residues in complex glycoconjugates. Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARSD. The function of ARSD has been established by previous studies. In the course of positional cloning of the gene mutant in X-linked chondrodysplasia punctata (OMIM Ref. No. 302950), Franco et al. (1995) identified a cluster of 3 sulfatase genes located in the region Xp22.3. The genes were arylsulfatases and were designated ARSD, ARSE (OMIM Ref. No. 300180), and ARSF (OMIM Ref. No. 300003), in that order, proceeding from the telomere of Xp toward the centromere. Mutations in ARSE were identified in males with chondrodysplasia punctata. Franco et al. (1995) showed that both ARSD and ARSE have 11 exons and are transcribed toward the telomere. Their natural substrate

was not determined. Meroni et al. (1996) reported that ARSD and ARSE have several typical features of genes that map in the pseudoautosomal region of the X chromosome, i.e., they escape X inactivation, have homologs on the Y chromosome, and are not conserved in mouse.

Meroni et al. (1996) noted that ARSD, ARSE, and STS have a conserved gene structure; alignment of the genomic structures revealed perfect conservation of the intron-exon junctions. Sequence analysis of the Y-linked homologs of ARSD and ARSE indicated that they represent truncated pseudogenes.

[14198] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14199] Franco, B.; Meroni, G.; Parenti, G.; Levilliers, J.; Bernard, L.; Gebbia, M.; Cox, L.; Maroteaux, P.; Sheffield, L.; Rappold, G. A.; Andria, G.; Petit, C.; Ballabio, A. : A cluster of sulfatase genes on Xp22.3: mutations in chondrodysplasia punctata (CDPX) and implications for warfarin embryopathy. Cell 81: 1-20, 1995. ; and

[14200] Meroni, G.; Franco, B.; Archidiacono, N.; Messali, S.; Andolfi, G.; Rocchi, M.; Ballabio, A. : Characterization of a cluster of sulfatase genes on Xp22.3 suggests gene dupli-

cations in a.

[14201] Further studies establishing the function and utilities of ARSD are found in John Hopkins OMIM database record ID 300002, and in cited publications numbered 9009–9010 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BRF1 Homolog, Subunit of RNA Polymerase III Transcription Initiation Factor IIIB (*S. cerevisiae*) (BRF1, Accession NM_001519) is another VGAM232 host target gene. BRF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BRF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRF1 BINDING SITE, designated SEQ ID:7258, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14202] Another function of VGAM232 is therefore inhibition of BRF1 Homolog, Subunit of RNA Polymerase III Transcription Initiation Factor IIIB (*S. cerevisiae*) (BRF1, Accession NM_001519), a gene which is a general activator of RNA polymerase III. Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with BRF1. The function of BRF1 has been established by previous studies. By screening a Burkitt lymphoma and other human cDNA cell libraries using degenerate PCR primers corresponding to peptide sequences of the 90-kD subunit of GTF3B, Wang and Roeder (1995) obtained a cDNA encoding TAF3B2, which they called TFIIIB90. Sequence analysis revealed that the 675-amino acid TAF3B2 protein contains a high mobility group protein-2 (HMG2; 163906)-related region in the highly charged C-terminal half of the protein and a sequence related to GTF2B (OMIM Ref. No. 189963) in the N terminus. Western blot analysis showed that TAF3B2 is expressed as a 92-kD protein, the C terminus of which binds TBP. Recombinant TAF3B2 together with TBP, but neither alone, could replace purified natural GTF3B. Deletion of either the N-terminal GTF2B-related or the C-terminal HMG2-related half of the protein abolished activity. Mital et al. (1996) cloned a cDNA identical to the TAF3B2 cDNA obtained by Wang and Roeder (1995) except for scattered nucleotide differences and the presence of 6 additional nucleotides. These last differences change the open reading frame, predicting a different sequence over 67 amino acids of the TAF3B2 protein, which Mital et

al. (1996) called BRF due to its homology with the *S. cerevisiae* BRF protein. Mital et al. (1996) confirmed the association of TAF3B2 with TBP reported by Wang and Roeder (1995).

[14203] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14204] Wang, Z.; Roeder, R. G. : Structure and function of a human transcription factor TFIIB subunit that is evolutionarily conserved and contains both TFIIB- and high-mobility-group protein 2-related domains. *Proc. Nat. Acad. Sci.* 92: 7026-7030, 1995. ; and

[14205] Mital, R.; Kobayashi, R.; Hernandez, N. : RNA polymerase III transcription from the human U6 and adenovirus type 2 VAI promoters has different requirements for human BRF, a subunit of hu.

[14206] Further studies establishing the function and utilities of BRF1 are found in John Hopkins OMIM database record ID 604902, and in cited publications numbered 2908-2909 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 3 (DDX3, Accession NM_024005) is another VGAM232 host target gene.

DDX3 BINDING SITE1 and DDX3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DDX3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX3 BINDING SITE1 and DDX3 BINDING SITE2, designated SEQ ID:23433 and SEQ ID:7037 respectively, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14207] Another function of VGAM232 is therefore inhibition of DEAD/H (Asp–Glu–Ala–Asp/His) Box Polypeptide 3 (DDX3, Accession NM_024005), a gene which interacts with hepatitis c virus core protein resulting a change in intracellular location. Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX3. The function of DDX3 has been established by previous studies. DEAD box proteins are putative RNA helicases that have a characteristic Asp–Glu–Ala–Asp (DEAD) box as 1 of 8 highly conserved sequence motifs. See 600396. Chung et al. (1995) cloned cDNAs encoding DDX3 (Genbank U50553), a putative RNA helicase belonging to the DEAD box protein family. Lahn

and Page (1997) identified DDX3, which they called DBX, as 1 of 5 X-linked genes that have homologs located in the nonrecombining region of the Y chromosome (NRY). See DBY (OMIM Ref. No. 400010). They determined that these 5 X-linked genes escape X inactivation. Lahn and Page (1997) postulated that these 5 genes are cases in which gene expression is maintained at comparable levels in males and females by preservation of homologous genes on both the X and the NRY, with male and female cells expressing both copies of each gene. Sequence analysis revealed that DBX shares 91% protein sequence identity with DBY, the Y-linked homolog.

[14208] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14209] Lahn, B. T.; Page, D. C. : Functional coherence of the human Y chromosome. *Science* 278: 675–680, 1997. ; and

[14211] Further studies establishing the function and utilities of DDX3 are found in John Hopkins OMIM database record ID

300160, and in cited publications numbered 1099 and 11000 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Engrailed Homolog 2 (EN2, Accession NM_001427) is another VGAM232 host target gene. EN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EN2 BINDING SITE, designated SEQ ID:7145, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14212] Another function of VGAM232 is therefore inhibition of Engrailed Homolog 2 (EN2, Accession NM_001427), a gene which may be required for normal cerebellar development; a homeobox protein, very strongly similar to murine En2. Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EN2. The function of EN2 has been established by previous studies. In *Drosophila*, the 'engrailed' (en) homeo box protein plays an important role during development in segmentation, where it is required

for the formation of posterior compartments. See EN1 (OMIM Ref. No. 131290). By low stringency hybridization, Poole et al. (1989) isolated from a human cosmid genomic library sequences homologous with a probe from the *Drosophila* 'engrailed' gene. Partial nucleotide sequence analysis showed a consensus splice acceptor site followed by an open reading frame capable of coding 104 amino acids; the first 94 amino acids showed 71% identity with the *Drosophila* engrailed protein. The shared region contained a homeo domain. At the amino acid level, the human sequence was 85% identical with the mouse En1 gene and 100% identical with the mouse En2 gene. Logan et al. (1992) isolated human and chicken genomic clones of the EN1 and EN2 genes. As in mouse, the predicted coding region of the human and chicken EN2 genes is interrupted by a single intron. The deduced 333-amino acid human EN2 protein is 90% identical to mouse En1. By sequence analysis, the authors determined that En proteins from various species contain 5 distinct conserved subregions. Northern blot analysis revealed that EN2, but not EN1, is expressed as a 4-kb mRNA in human cerebellum. Similarly, Western blots indicated that only EN2 is expressed fetal cerebellum. To study the role of the En2 gene in de-

velopment, Joyner et al. (1989) created mutations in 3 pluripotent embryonic stem cell (ES) lines by homologous recombination. Joyner et al. (1991) generated mice homozygous for a targeted deletion of the En2 homeo box. The mutant mice were viable and showed no obvious defects in embryonic development. The authors suggested that this might be due to functional redundancy of En2 and En1. They found that the mutant mice had abnormal foliation in the adult cerebellum, where normally only En2 is expressed. To determine whether the contrasting phenotypes of En2 and En1 reflect differences in temporal expression or biochemical activity of the En proteins, Hanks et al. (1995) replaced En1 coding sequences with En2 sequences in transgenic mice by gene targeting. The En2 sequences rescued all En1 mutant defects, demonstrating that the difference between En1 and En2 stems from their divergent expression patterns. By Southern blot analysis of DNA from a panel of human-hamster somatic cell hybrids, Poole et al. (1989) mapped the EN2 gene to human chromosome 7; regional mapping by in situ hybridization localized it to 7q36. Logan et al. (1989) arrived independently at the same assignment.

[14213] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [14214] Hanks, M.; Wurst, W.; Anson–Cartwright, L.; Auerbach, A. B.; Joyner, A. L. : Rescue of the En–1 mutant phenotype by replacement of En–1 with En–2. Science 269: 679–682, 1995. ; and
- [14215] Joyner, A. L.; Herrup, K.; Auerbach, B. A.; Davis, C. A.; Rossant, J. : Subtle cerebellar phenotype in mice homozygous for a targeted deletion of the En–2 homeobox. Science 251: 1239–124.
- [14216] Further studies establishing the function and utilities of EN2 are found in John Hopkins OMIM database record ID 131310, and in cited publications numbered 2603, 2977–2978, 2606–260 and 2979 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Growth Arrest–specific 7 (GAS7, Accession NM_003644) is another VGAM232 host target gene. GAS7 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GAS7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAS7 BINDING SITE, designated SEQ ID:9716,

to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14217] Another function of VGAM232 is therefore inhibition of Growth Arrest-specific 7 (GAS7, Accession NM_003644), a gene which may play a role in promoting maturation and morphological differentiation of cerebellar neurons. Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAS7. The function of GAS7 has been established by previous studies. Growth arrest-specific (GAS) genes are expressed preferentially in cells that enter a quiescent state. Ju et al. (1998) described the isolation and characterization of a GAS gene (GAS7) that is expressed primarily in vivo in terminally differentiated brain cells and particularly prominently in mature cerebellar Purkinje neurons. The gene had originally been identified in serum-starved murine fibroblasts. GAS7 transcripts encode a 48-kD protein containing a structural domain that resembles sequences of OCT2 (OMIM Ref. No. 602608), a POU transcription factor implicated in neuronal development, and synapsins, e.g., synapsin I (SYN1; 313440), which have a role in modulating neurotransmitter release. Using in situ hybridization and immunocytochemical anal-

ysis, Ju et al. (1998) showed that inhibition of production of GAS7 in terminally differentiating cultures of embryonic murine cerebellum impedes neurite outgrowth from maturing Purkinje cells. Conversely, GAS7 overexpression in undifferentiated neuroblastoma cell cultures dramatically promotes neurite-like outgrowth. Collectively, the results provided evidence for an association between expression of GAS7 and neuronal development. By analysis of cell hybrid DNAs prepared from a panel of 21 Chinese hamster/mouse hybrid cell lines, Ju et al. (1998) mapped the mouse Gas7 gene to chromosome 11. They reported that a human DNA fragment (GenBank G13706) having 85% sequence identity with Gas7 mapped to 17p, which is largely syngeneic with mouse chromosome 11 (Kurtz and Zimmer, 1995).

[14218] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14221] Further studies establishing the function and utilities of GAS7 are found in John Hopkins OMIM database record ID 603127, and in cited publications numbered 641–64 and 644 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glutathione Peroxidase 3 (plasma) (GPX3, Accession NM_002084) is another VGAM232 host target gene. GPX3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPX3 BINDING SITE, designated SEQ ID:7879, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14222] Another function of VGAM232 is therefore inhibition of Glutathione Peroxidase 3 (plasma) (GPX3, Accession NM_002084), a gene which reduces lipid hydroperoxide

and H₂O₂ in plasma. Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPX3. The function of GPX3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM225. Kelch-like 1 (Drosophila) (KLHL1, Accession NM_020866) is another VGAM232 host target gene. KLHL1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KLHL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL1 BINDING SITE, designated SEQ ID:21919, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14223] Another function of VGAM232 is therefore inhibition of Kelch-like 1 (Drosophila) (KLHL1, Accession NM_020866). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL1. Megalencephalic Leukoencephalopathy with Subcortical Cysts 1 (MLC1, Accession

NM_015166) is another VGAM232 host target gene. MLC1 BINDING SITE1 and MLC1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MLC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLC1 BINDING SITE1 and MLC1 BINDING SITE2, designated SEQ ID:17525 and SEQ ID:29219 respectively, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14224] Another function of VGAM232 is therefore inhibition of Megalencephalic Leukoencephalopathy with Subcortical Cysts 1 (MLC1, Accession NM_015166). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLC1. Neurofibromin 1 (neurofibromatosis, von Recklinghausen disease, Watson disease) (NF1, Accession NM_000267) is another VGAM232 host target gene. NF1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of NF1 BINDING SITE, designated SEQ ID:5813, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14225] Another function of VGAM232 is therefore inhibition of Neurofibromin 1 (neurofibromatosis, von Recklinghausen disease, Watson disease) (NF1, Accession NM_000267). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NF1. Neurotensin Receptor 1 (high affinity) (NTSR1, Accession NM_002531) is another VGAM232 host target gene. NTSR1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NTSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTSR1 BINDING SITE, designated SEQ ID:8370, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14226] Another function of VGAM232 is therefore inhibition of Neurotensin Receptor 1 (high affinity) (NTSR1, Accession NM_002531), a gene which is associated with G proteins

that activate a phosphatidylinositol– calcium second messenger system. Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTSR1. The function of NTSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. Protein Kinase C-like 1 (PRKCL1, Accession XM_031273) is another VGAM232 host target gene. PRKCL1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRKCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKCL1 BINDING SITE, designated SEQ ID:31329, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14227] Another function of VGAM232 is therefore inhibition of Protein Kinase C-like 1 (PRKCL1, Accession XM_031273). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKCL1. RAD52 Homolog (*S. cerevisiae*)

(RAD52, Accession NM_134422) is another VGAM232 host target gene. RAD52 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAD52, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD52 BINDING SITE, designated SEQ ID:28645, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14228] Another function of VGAM232 is therefore inhibition of RAD52 Homolog (*S. cerevisiae*) (RAD52, Accession NM_134422). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD52. Receptor Tyrosine Kinase-like Orphan Receptor 2 (ROR2, Accession NM_004560) is another VGAM232 host target gene. ROR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ROR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROR2 BINDING SITE, designated SEQ ID:10899, to the nu-

cleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14229] Another function of VGAM232 is therefore inhibition of Receptor Tyrosine Kinase-like Orphan Receptor 2 (ROR2, Accession NM_004560), a gene which may be involved in the early formayion of the chonrocytes. Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROR2. The function of ROR2 has been established by previous studies. Receptor tyrosine kinases often have critical roles in particular cell lineages by initiating signal cascades in those lineages. Many lineage-restricted receptor tyrosine kinases were initially identified as 'orphans' homologous to known receptors, and only subsequently used to identify their unknown growth factors. DeChiara et al. (2000) identified one such orphan, encoded by Ror2. They reported that disruption of mouse Ror2 leads to profound skeletal abnormalities, with essentially all endochondrally derived bones foreshortened or misshapen, albeit to differing degrees. Further, they found that Ror2 is selectively expressed in the chondrocytes of all developing cartilage anlagen, where it is essential during initial growth and patterning, as well as subsequently in the

proliferating chondrocytes of mature growth plates, where it is required for normal expansion. Thus, Ror2 encodes a receptor-like tyrosine kinase that is selectively expressed in, and particularly important for, the chondrocyte lineage. Animal model experiments lend further support to the function of ROR2. Takeuchi et al. (2000) generated mice with a mutation in the Ror2 gene and observed that homozygous mutant mice died just after birth, exhibiting dwarfism, severe cyanosis, and short limbs and tails.

Whole-mount in situ hybridization analysis showed that Ror2 is expressed in the branchial arches, heart, and limb/tailbuds, in addition to the developing nervous system. The Ror2-deficient mice had cardiac septal defects and skeletal abnormalities, including shorter limbs, vertebrae, and facial structure, with a particular defect in their distal portions. Takeuchi et al. (2000) concluded that Ror2 plays essential roles in the development of the heart and in limb/tail formation, in particular cardiac septal formation and ossification of distal portions of limbs and tails.

[14230] It is appreciated that the abovementioned animal model for ROR2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[14231] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14232] Takeuchi, S.; Takeda, K.; Oishi, I.; Nomi, M.; Ikeya, M.; Itoh, K.; Tamura, S.; Ueda, T.; Hatta, T.; Otani, H.; Terashima, T.; Takada, S.; Yamamura, H.; Akira, S.; Minami, Y. : Mouse Ror2 receptor tyrosine kinase is required for the heart development and limb formation. *Genes Cells* 5: 71–78, 2000. ; and

[14233] DeChiara, T. M.; Kimble, R. B.; Poueymirou, W. T.; Rojas, J.; Masiakowski, P.; Valenzuela, D. M.; Yancopoulos, G. D. : Ror2, encoding a receptor–like tyrosine kinase, is required for carti.

[14234] Further studies establishing the function and utilities of ROR2 are found in John Hopkins OMIM database record ID 602337, and in cited publications numbered 6739, 12054, 2780–2781, 6013, 6310, 4678, 4846–278 and 6740 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Serine (or cysteine) Proteinase Inhibitor, Clade E (nexin, plasminogen activator inhibitor type 1), Member 2 (SERPINE2, Accession XM_059422) is another VGAM232 host target gene. SERPINE2 BINDING SITE is HOST TARGET binding site found in

the 5' untranslated region of mRNA encoded by SERPINE2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERPINE2 BINDING SITE, designated SEQ ID:36988, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14235] Another function of VGAM232 is therefore inhibition of Serine (or cysteine) Proteinase Inhibitor, Clade E (nexin, plasminogen activator inhibitor type 1), Member 2 (SERPINE2, Accession XM_059422), a gene which inhibits thrombin, trypsin, and urokinase. binds heparin. promotes neurite extension. Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINE2. The function of SERPINE2 has been established by previous studies. Protease nexin I is the most important physiologic regulator of alpha-thrombin in tissues. PN1 is highly expressed and developmentally regulated in the nervous system where it is concentrated at neuromuscular junctions and also central synapses in the hippocampus and striatum. Approximately 10% of identified proteins at

mammalian neuromuscular junctions are serine protease inhibitors, consistent with their central role in balancing serine protease activity to develop, maintain, and remodel synapses. By Southern blot hybridization of PN1 cDNA to somatic cell hybrid DNAs, Carter et al. (1995) mapped the PN1 gene, also known as PI7, to 2q33–q35. The regional localization was achieved by studying microcell hybrids that retained fragments of chromosome 2. The gene was located between the markers CRYGA (OMIM Ref. No. 123660) and MYL1 (OMIM Ref. No. 160780), both of which are located in the 2q33–q35 region. Further observations indicated that PN1 is close to MYL1 and farther removed from CRYGA. By hybrid cell methods, Carter et al. (1995) mapped the homologous gene to mouse chromosome 1 and sheep 2q, which are known to have regions of homology of synteny to human 2q. Carter et al. (1995) noted that a form of juvenile-onset amyotrophic lateral sclerosis maps to this same region of chromosome 2, making PN1 a candidate gene. The mammalian sex-determining pathway is controlled by the presence or absence of SRY (OMIM Ref. No. 480000) expression in the embryonic gonad. In order to identify additional sex-determining or gonadal differentiation genes, Grimmond

et al. (2000) screened for genes exhibiting sexually dimorphic patterns of expression in the mouse gonad at 12.5 and 13.5 days postcoitum, after overt gonad differentiation, by comparing complex cDNA probes derived from male and female gonadal tissue at these stages on microarrays constructed from a normalized urogenital ridge library. Using in situ hybridization analysis, they determined that mouse Pn1 and vanin-1 (OMIM Ref. No. 603570) exhibit male-specific expression prior to overt gonadal differentiation and are detected in the somatic portion of the developing gonad, suggesting to the authors a possible direct link to the testis-determining pathway for both genes. . Grimmond, S.; Van Hateren, N.; Siggers, P.; Arkell, R.; Larder, R.; Soares, M. B.; de Fatima Bonaldo, M.; Smith, L.; Tymowska-Lalanne, Z.; Wells, C.; Greenfield, A. : Sexually dimorphic expression of protease nexin-1 and vanin-1 in the developing mouse gonad prior to overt differentiation suggests a role in mammalian sexual development. Hum. Molec. Genet. 9: 1553-1560, 2000. PubMed ID : 10888606

[14236] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [14237] Carter, R. E.; Cerosaletti, K. M.; Burkin, D. J.; Fournier, R. E. K.; Jones, C.; Greenberg, B. D.; Citron, B. A.; Festoff, B. W. : The gene for the serpin thrombin inhibitor (P17), pro-tease nexin 1, is located on human chromosome 2q33–q35 and on syntenic regions in the mouse and sheep genomes. *Genomics* 27: 196–199, 1995. ; and
- [14238] Grimmond, S.; Van Hateren, N.; Siggers, P.; Arkell, R.; Larder, R.; Soares, M. B.; de Fatima Bonaldo, M.; Smith, L.; Tymowska-Lalanne, Z.; Wells, C.; Greenfield, A. : Sexually dimorphic ex.
- [14239] Further studies establishing the function and utilities of SERPINE2 are found in John Hopkins OMIM database record ID 177010, and in cited publications numbered 2752–2753, 1 and 1160–1161 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 20 (phosphate transporter), Member 2 (SLC20A2, Accession NM_006749) is another VGAM232 host target gene. SLC20A2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLC20A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

SLC20A2 BINDING SITE, designated SEQ ID:13603, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14240] Another function of VGAM232 is therefore inhibition of Solute Carrier Family 20 (phosphate transporter), Member 2 (SLC20A2, Accession NM_006749), a gene which is a sodium–phosphate symporter. Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC20A2. The function of SLC20A2 has been established by previous studies. The host range of retroviruses is determined primarily by the presence of specific receptors on target cells which are recognized by the retroviral envelope glycoprotein. Somatic cell hybrids have been used to determine the chromosomal location of several retroviral receptors in mice prior to their molecular cloning. By use of human–Chinese hamster somatic cell hybrids and a retroviral vector, Garcia et al. (1991) mapped the receptor for the amphotropic murine leukemia virus to the pericentromeric region of human chromosome 8. Kaelbling et al. (1991) described a receptor for the gibbon ape leukemia retrovirus. In an effort to isolate related human genes to determine if these function as receptors for any other

retroviruses, van Zeijl et al. (1993, 1994) screened a human cDNA library at low stringency using GLVR1 (OMIM Ref. No. 137570) as a probe. A single GLVR1-related cDNA (designated GLVR2) was isolated and found to have 62% identity to GLVR1 and its amino acid sequence. Using a somatic cell hybrid panel, GLVR2 was found to map to human chromosome 8, a location distinct from that for GLVR1, which maps to human chromosome 2. The location of GLVR2 on chromosome 8 highlighted the possibility that the locus may encode a receptor for the murine amphotropic virus because a receptor gene (MLVAR) for this virus was mapped to chromosome 8 by Garcia et al. (1991). Expression of GLVR2 in CHO-K1 cells, which are resistant to infection by amphotropic virus because of the absence of a receptor, rendered the cells sensitive to infection by the virus. Thus, GLVR2 is a receptor for amphotropic virus. It was pointed out by van Zeijl et al. (1994) that expression of the GLVR2 protein might be a requirement for infection of human cells by amphotropic retroviral vectors for purposes of gene therapy.

[14241] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14243] Garcia, J. V.; Jones, C.; Miller, A. D. : Localization of the amphotropic murine leukemia virus receptor gene to the pericentromeric region of human chromosome 8. *J. Virol.* 65: 6316–6319.

[14244] Further studies establishing the function and utilities of SLC20A2 are found in John Hopkins OMIM database record ID 158378, and in cited publications numbered 380 and 4026–3802 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 30 (zinc transporter), Member 3 (SLC30A3, Accession NM_003459) is another VGAM232 host target gene. SLC30A3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC30A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC30A3 BINDING SITE, designated SEQ ID:9527, to the nucleotide sequence of

VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14245] Another function of VGAM232 is therefore inhibition of Solute Carrier Family 30 (zinc transporter), Member 3 (SLC30A3, Accession NM_003459). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC30A3. Spondin 1, (f-spondin) Extracellular Matrix Protein (SPON1, Accession XM_031184) is another VGAM232 host target gene. SPON1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPON1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPON1 BINDING SITE, designated SEQ ID:31301, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14246] Another function of VGAM232 is therefore inhibition of Spondin 1, (f-spondin) Extracellular Matrix Protein (SPON1, Accession XM_031184). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPON1.

Vascular Endothelial Growth Factor (VEGF, Accession NM_003376) is another VGAM232 host target gene. VEGF BINDING SITE1 and VEGF BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by VEGF, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VEGF BINDING SITE1 and VEGF BINDING SITE2, designated SEQ ID:9408 and SEQ ID:9409 respectively, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14247] Another function of VGAM232 is therefore inhibition of Vascular Endothelial Growth Factor (VEGF, Accession NM_003376), a gene which induces endothelial cell proliferation and vascular permeability. Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VEGF. The function of VEGF has been established by previous studies. To explore the possibility that VEGF and angiopoietins (see OMIM Ref. No. ANG2, 601922) collaborate during tumor angiogenesis, Holash et al. (1999) analyzed several different murine and human tumor models. Holash et al.

(1999) noted that angiopoietin-1 (ANG1; 601667) was antiapoptotic for cultured endothelial cells and expression of its antagonist angiopoietin-2 was induced in the endothelium of co-opted tumor vessels before their regression. In contrast, marked induction of VEGF expression occurred much later in tumor progression, in the hypoxic periphery of tumor cells surrounding the few remaining internal vessels, as well as adjacent to the robust plexus of vessels at the tumor margin. Expression of Ang2 in the few surviving internal vessels and in the angiogenic vessels at the tumor margin suggested that the destabilizing action of angiopoietin-2 facilitates the angiogenic action of VEGF at the tumor rim. Holash et al. (1999) implanted rat RBA mammary adenocarcinoma cells into rat brains. Tumor cells rapidly associated with and migrated along cerebral blood vessels. There was minimal upregulation of VEGF. Holash et al. (1999) suggested that a subset of tumors rapidly co-opts existing host vessels to form an initially well vascularized tumor mass. Perhaps as part of a host defense mechanism there is widespread regression of these initially co-opted vessels, leading to a secondarily avascular tumor and a massive tumor cell loss. However, the remaining tumor is ultimately rescued by robust an-

giogenesis at the tumor margin. Animal model experiments lend further support to the function of VEGF. De Fraipont et al. (2000) measured the cytosolic concentrations of 3 proteins involved in angiogenesis, namely, platelet-derived endothelial cell growth factor (PDEC GF; 131222), VEGFA, and thrombospondin-1 (THBS1; 188060) in a series of 43 human sporadic adrenocortical tumors. The tumors were classified as adenomas, transitional tumors, or carcinomas. PDEC GF/thymidine phosphorylase levels were not significantly different among these 3 groups. One hundred percent of the adenomas and 73% of the transitional tumors showed VEGFA concentrations under the threshold value of 107 ng/g protein, whereas 75% of the carcinomas had VEGFA concentrations above this threshold value. Similarly, 89% of the adenomas showed THBS1 concentrations above the threshold value of 57 microg/g protein, whereas only 25% of the carcinomas and 33% of the transitional tumor samples did so. IGF2 (OMIM Ref. No. 147470) overexpression, a common genetic alteration of adrenocortical carcinomas, was significantly correlated with higher VEGFA and lower THBS1 concentrations. The authors concluded that a decrease in THBS1 expression is an event that precedes an increase in VEGFA

expression during adrenocortical tumor progression. The population of premalignant tumors with low THBS1 and normal VEGFA levels could represent a selective target for antiangiogenic therapies.

[14248] It is appreciated that the abovementioned animal model for VEGF is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[14249] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14250] Holash, J.; Maisonpierre, P. C.; Compton, D.; Boland, P.; Alexander, C. R.; Zagzag, D.; Yancopoulos, G. D.; Wiegand, S. J. : Vessel cooption, regression, and growth in tumors mediated by angiopoietins and VEGF. Science 284: 1994–1998, 1999. ; and

[14251] de Fraipont, F.; El Atifi, M.; Gicquel, C.; Bertagna, X.; Chambaz, E. M.; Feige, J. J. : Expression of the angiogenesis markers vascular endothelial growth factor-A, thrombospondin-1, and.

[14252] Further studies establishing the function and utilities of VEGF are found in John Hopkins OMIM database record ID 192240, and in cited publications numbered 3273,

11896, 10431–10432, 10516–10435, 11162–10442, 10595, 11761–1045 and 10479–9662 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Calcium Channel, Voltage-dependent, Gamma Subunit 4 (CACNG4, Accession NM_014405) is another VGAM232 host target gene. CACNG4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CACNG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNG4 BINDING SITE, designated SEQ ID:15745, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14253] Another function of VGAM232 is therefore inhibition of Calcium Channel, Voltage-dependent, Gamma Subunit 4 (CACNG4, Accession NM_014405). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNG4. Calcium/calmodulin-dependent Protein Kinase Kinase 1, Alpha (CAMKK1, Accession NM_032294) is another VGAM232 host target gene. CAMKK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by CAMKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMKK1 BINDING SITE, designated SEQ ID:26069, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14254] Another function of VGAM232 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase Kinase 1, Alpha (CAMKK1, Accession NM_032294). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK1. CAMP-GEFII (Accession NM_007023) is another VGAM232 host target gene. CAMP-GEFII BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAMP-GEFII, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMP-GEFII BINDING SITE, designated SEQ ID:13882, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14255] Another function of VGAM232 is therefore inhibition of

CAMP-GEFII (Accession NM_007023). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMP-GEFII. Claudin 7 (CLDN7, Accession NM_001307) is another VGAM232 host target gene. CLDN7 BINDING SITE1 and CLDN7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CLDN7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLDN7 BINDING SITE1 and CLDN7 BINDING SITE2, designated SEQ ID:6989 and SEQ ID:45384 respectively, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14256] Another function of VGAM232 is therefore inhibition of Claudin 7 (CLDN7, Accession NM_001307). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLDN7. Erythrocyte Membrane Protein Band 4.1-like 1 (EPB41L1, Accession XM_047295) is another VGAM232 host target gene. EPB41L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by EPB41L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPB41L1 BINDING SITE, designated SEQ ID:34941, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14257] Another function of VGAM232 is therefore inhibition of Erythrocyte Membrane Protein Band 4.1-like 1 (EPB41L1, Accession XM_047295). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB41L1. FLJ20886 (Accession XM_170820) is another VGAM232 host target gene. FLJ20886 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20886, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20886 BINDING SITE, designated SEQ ID:45595, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14258] Another function of VGAM232 is therefore inhibition of

FLJ20886 (Accession XM_170820). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20886. FLJ23024 (Accession NM_024936) is another VGAM232 host target gene. FLJ23024 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23024 BINDING SITE, designated SEQ ID:24473, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14259] Another function of VGAM232 is therefore inhibition of FLJ23024 (Accession NM_024936). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23024. FLJ31709 (Accession NM_144636) is another VGAM232 host target gene. FLJ31709 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ31709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ31709 BINDING SITE, designated SEQ ID:29457, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14260] Another function of VGAM232 is therefore inhibition of FLJ31709 (Accession NM_144636). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31709. GPCR150 (Accession NM_014373) is another VGAM232 host target gene. GPCR150 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GPCR150, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPCR150 BINDING SITE, designated SEQ ID:15708, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14261] Another function of VGAM232 is therefore inhibition of GPCR150 (Accession NM_014373). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPCR150. HELO1 (Accession NM_021814) is another VGAM232 host

target gene. HELO1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HELO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HELO1 BINDING SITE, designated SEQ ID:22384, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14262] Another function of VGAM232 is therefore inhibition of HELO1 (Accession NM_021814). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HELO1. IDI2 (Accession NM_033261) is another VGAM232 host target gene. IDI2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IDI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IDI2 BINDING SITE, designated SEQ ID:27092, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14263] Another function of VGAM232 is therefore inhibition of IDI2 (Accession NM_033261). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IDI2. KIAA0515 (Accession XM_033380) is another VGAM232 host target gene. KIAA0515 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0515 BINDING SITE, designated SEQ ID:31926, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14264] Another function of VGAM232 is therefore inhibition of KIAA0515 (Accession XM_033380). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0515. KIAA0561 (Accession XM_038150) is another VGAM232 host target gene. KIAA0561 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0561, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0561 BINDING SITE, designated SEQ ID:32765, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14265] Another function of VGAM232 is therefore inhibition of KIAA0561 (Accession XM_038150). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0561. KIAA1052 (Accession NM_014956) is another VGAM232 host target gene. KIAA1052 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1052 BINDING SITE, designated SEQ ID:17314, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14266] Another function of VGAM232 is therefore inhibition of KIAA1052 (Accession NM_014956). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1052. KIAA1509 (Accession XM_029353) is another VGAM232 host target gene. KIAA1509 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1509, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1509 BINDING SITE, designated SEQ ID:30874, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14267] Another function of VGAM232 is therefore inhibition of KIAA1509 (Accession XM_029353). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1509. KIAA1855 (Accession XM_166453) is another VGAM232 host target gene. KIAA1855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1855 BINDING SITE, designated SEQ ID:44360, to the nucleotide sequence of VGAM232 RNA, herein designated

VGAM RNA, also designated SEQ ID:2943.

[14268] Another function of VGAM232 is therefore inhibition of KIAA1855 (Accession XM_166453). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1855. LIM and SH3 Protein 1 (LASP1, Accession NM_006148) is another VGAM232 host target gene. LASP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LASP1 BINDING SITE, designated SEQ ID:12800, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14269] Another function of VGAM232 is therefore inhibition of LIM and SH3 Protein 1 (LASP1, Accession NM_006148). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LASP1. MGC13057 (Accession NM_032321) is another VGAM232 host target gene. MGC13057 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by

MGC13057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13057 BINDING SITE, designated SEQ ID:26126, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14270] Another function of VGAM232 is therefore inhibition of MGC13057 (Accession NM_032321). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13057. Netrin 4 (NTN4, Accession XM_031896) is another VGAM232 host target gene. NTN4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NTN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTN4 BINDING SITE, designated SEQ ID:31514, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14271] Another function of VGAM232 is therefore inhibition of Netrin 4 (NTN4, Accession XM_031896). Accordingly, util-

ities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTN4. PPI5PIV (Accession NM_019892) is another VGAM232 host target gene. PPI5PIV BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPI5PIV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPI5PIV BINDING SITE, designated SEQ ID:21276, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14272] Another function of VGAM232 is therefore inhibition of PPI5PIV (Accession NM_019892). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPI5PIV. SKIP (Accession NM_016532) is another VGAM232 host target gene. SKIP BINDING SITE1 and SKIP BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SKIP, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SKIP BINDING

SITE1 and SKIP BINDING SITE2, designated SEQ ID:18598 and SEQ ID:28261 respectively, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14273] Another function of VGAM232 is therefore inhibition of SKIP (Accession NM_016532). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SKIP. ZNF340 (Accession XM_097701) is another VGAM232 host target gene. ZNF340 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF340 BINDING SITE, designated SEQ ID:41033, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14274] Another function of VGAM232 is therefore inhibition of ZNF340 (Accession XM_097701). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF340. LOC113763 (Accession NM_138434) is another VGAM232

host target gene. LOC113763 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC113763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC113763 BINDING SITE, designated SEQ ID:28802, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14275] Another function of VGAM232 is therefore inhibition of LOC113763 (Accession NM_138434). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113763. LOC145482 (Accession XM_085154) is another VGAM232 host target gene. LOC145482 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145482, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145482 BINDING SITE, designated SEQ ID:37877, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14276] Another function of VGAM232 is therefore inhibition of LOC145482 (Accession XM_085154). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145482. LOC145694 (Accession XM_096838) is another VGAM232 host target gene. LOC145694 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145694, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145694 BINDING SITE, designated SEQ ID:40557, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14277] Another function of VGAM232 is therefore inhibition of LOC145694 (Accession XM_096838). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145694. LOC149171 (Accession XM_086450) is another VGAM232 host target gene. LOC149171 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149171, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149171 BINDING SITE, designated SEQ ID:38667, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14278] Another function of VGAM232 is therefore inhibition of LOC149171 (Accession XM_086450). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149171. LOC149706 (Accession XM_097718) is another VGAM232 host target gene. LOC149706 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149706, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149706 BINDING SITE, designated SEQ ID:41058, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14279] Another function of VGAM232 is therefore inhibition of LOC149706 (Accession XM_097718). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC149706. LOC164382 (Accession XM_104390) is another VGAM232 host target gene. LOC164382 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC164382, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164382 BINDING SITE, designated SEQ ID:42164, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14280] Another function of VGAM232 is therefore inhibition of LOC164382 (Accession XM_104390). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164382. LOC166042 (Accession XM_093623) is another VGAM232 host target gene. LOC166042 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC166042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC166042 BINDING SITE, designated SEQ ID:40200, to the nucleotide sequence of VGAM232 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2943.

[14281] Another function of VGAM232 is therefore inhibition of LOC166042 (Accession XM_093623). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166042. LOC204161 (Accession XM_118480) is another VGAM232 host target gene. LOC204161 BINDING SITE1 and LOC204161 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC204161, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204161 BINDING SITE1 and LOC204161 BINDING SITE2, designated SEQ ID:43580 and SEQ ID:43581 respectively, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:2943.

[14282] Another function of VGAM232 is therefore inhibition of LOC204161 (Accession XM_118480). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204161. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 233 (VGAM233) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14283] VGAM233 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM233 was detected is described hereinabove with reference to Figs. 1–8.

[14284] VGAM233 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM233 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14285] VGAM233 gene encodes a VGAM233 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM233

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM233 precursor RNA is designated SEQ ID:219, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:219 is located at position 55213 relative to the genome of Calitrichine Herpesvirus 3.

[14286] VGAM233 precursor RNA folds onto itself, forming VGAM233 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14287] An enzyme complex designated DICER COMPLEX, `dices` the VGAM233 folded precursor RNA into VGAM233 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 60%) nucleotide sequence of VGAM233 RNA is designated SEQ ID:2944, and is provided hereinbelow with reference to the sequence listing part.

[14288] VGAM233 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM233 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM233 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[14289] VGAM233 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM233 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM233 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM233 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM233 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[14290] The complementary binding of VGAM233 RNA, herein designated VGAM RNA, to host target binding sites on VGAM233 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM233 host target RNA into VGAM233 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14291] It is appreciated that VGAM233 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM233 host target genes. The mRNA of each one of this plurality of VGAM233 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM233 RNA, herein designated VGAM RNA, and which when bound by VGAM233 RNA causes inhibition of translation of respective one or more VGAM233 host target proteins.

[14292] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM233 gene, herein designated VGAM GENE, on one or more VGAM233 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[14293] It is yet further appreciated that a function of VGAM233 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM233 correlate with, and may be deduced from, the identity of the host target genes which VGAM233 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14294] Nucleotide sequences of the VGAM233 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM233 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM233 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM233 are further described hereinbelow with reference to Table 1.

[14295] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM233 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM233 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[14296] As mentioned hereinabove with reference to Fig. 1, a function of VGAM233 gene, herein designated VGAM is inhibition of expression of VGAM233 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM233 correlate with, and may be deduced from, the identity of the target genes which VGAM233 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14297] Bone Morphogenetic Protein 6 (BMP6, Accession NM_001718) is a VGAM233 host target gene. BMP6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BMP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BMP6 BINDING SITE, designated SEQ ID:7454, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14298] A function of VGAM233 is therefore inhibition of Bone Morphogenetic Protein 6 (BMP6, Accession NM_001718), a gene which induces cartilage and bone formation. Accordingly, utilities of VGAM233 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with BMP6. The function of BMP6 has been established by previous studies. See BMP5 (OMIM Ref. No. 112265). Hahn et al. (1992) mapped both BMP5 and BMP6 to human chromosome 6 by study of human/rodent somatic cell hybrid lines with cDNA probes. Olavesen et al. (1997) reported fine mapping of 39 ESTs on 6p25–p23. Most of the ESTs (31 of 39) were positioned in the 6p24–p23 interval; of these, 8 were located within a single PAC clone. BMP6 was 1 of the 8 loci on the PAC, between TFAP2 (OMIM Ref. No. 107580) at the centromeric side and DSP (OMIM Ref. No. 125647) on the telomeric side. Rickard et al. (1998) presented evidence that the skeletal effects of estrogen on bone and cartilage may be mediated by increased production of BMP6 by osteoblasts. They investigated the effect of estrogen on BMP production in 2 estrogen-responsive, human immortalized cell lines that display the mature osteoblast phenotype.

[14299] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14300] Hahn, G. V.; Cohen, R. B.; Wozney, J. M.; Levitz, C. L.; Shore, E. M.; Zasloff, M. A.; Kaplan, F. S. : A bone morpho-

genetic protein subfamily: chromosomal localization of human genes for BMP5, BMP6, and BMP7. Genomics 14: 759–762, 1992. ; and

[14301] Rickard, D. J.; Hofbauer, L. C.; Bonde, S. K.; Gori, F.; Spelsberg, T. C.; Riggs, B. L. : Bone morphogenetic protein–6 production in human osteoblastic cell lines: selective regulation b.

[14302] Further studies establishing the function and utilities of BMP6 are found in John Hopkins OMIM database record ID 112266, and in cited publications numbered 2714–191 and 4585 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Calcium Channel, Voltage–dependent, Beta 1 Subunit (CACNB1, Accession NM_000723) is another VGAM233 host target gene. CACNB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CACNB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNB1 BINDING SITE, designated SEQ ID:6386, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14303] Another function of VGAM233 is therefore inhibition of Calcium Channel, Voltage-dependent, Beta 1 Subunit (CACNB1, Accession NM_000723), a gene which may not only play an important role in the transport/insertion of the alpha-1S subunit into the membrane. Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNB1. The function of CACNB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM114. Disrupted In Schizophrenia 1 (DISC1, Accession NM_018662) is another VGAM233 host target gene. DISC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DISC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DISC1 BINDING SITE, designated SEQ ID:20735, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14304] Another function of VGAM233 is therefore inhibition of Disrupted In Schizophrenia 1 (DISC1, Accession

NM_018662), a gene which has globular N-terminal domain(s) and a helical C-terminal domain. Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DISC1. The function of DISC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Ectodermal-neural Cortex (with BTB-like domain) (ENC1, Accession NM_003633) is another VGAM233 host target gene. ENC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ENC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENC1 BINDING SITE, designated SEQ ID:9698, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14305] Another function of VGAM233 is therefore inhibition of Ectodermal-neural Cortex (with BTB-like domain) (ENC1, Accession NM_003633), a gene which is an actin-binding protein involved in the regulation of neuronal process formation and in differentiation of neural crest cells. Accord-

ingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENC1. The function of ENC1 has been established by previous studies. DNA damage and/or hyperproliferative signals activate wildtype p53 tumor suppressor protein (TP53; 191170), inducing cell cycle arrest or apoptosis. Mutations that inactivate p53 occur in 50% of all tumors. Polyak et al. (1997) used serial analysis of gene expression (SAGE) to evaluate cellular mRNA levels in a colorectal cancer cell line transfected with p53. Of 7,202 transcripts identified, only 14 were expressed at levels more than 10-fold higher in p53-expressing cells than in control cells. Polyak et al. (1997) termed these genes 'p53-induced genes,' or PIGs, several of which were predicted to encode redox-controlling proteins. They noted that reactive oxygen species (ROS) are potent inducers of apoptosis. Flow cytometric analysis showed that p53 expression induces ROS production, which increases as apoptosis progresses under some conditions. The authors stated that the PIG10 gene, also called ENC1, encodes an actin-binding protein. By screening fetal and adult hippocampus cDNA libraries using a brain development-related cDNA as the probe, Kim et al. (1998) obtained cD-

NAs encoding ENC1, which they called NRPB (nuclear-restricted protein/brain). Human and mouse ENC1 share 99% amino acid identity. The deduced 589-amino acid ENC1 protein has a 114-amino acid BTB/POZ-like domain in the alpha-helical N terminus and a beta sheet bearing a 50-amino acid 'kelch' motif repeated 6 times in the C terminus. The kelch motif invariably contains 2 adjacent glycine residues and shares homology with several actin-associated proteins, including the *Drosophila* kelch protein. Northern blot analysis detected abundant expression of a 5.5-kb ENC1 transcript in fetal brain, with moderate expression in fetal heart, lung, and kidney. In adult tissues, high levels of ENC1 were detected in brain, particularly in amygdala and hippocampus, and lower levels were detected in pancreas. In 12 day- but not 10 day-postcoitus mouse embryos, expression of Enc1 was 50-fold higher in brain than in other tissues. Immunoprecipitation and Western blot analysis showed that ENC1 is expressed as a 67-kD protein in nuclear pellets and as 67- and 57-kD proteins in total cell lysates from primary neurons. Western blot analysis, immunofluorescence, and confocal microscopy demonstrated that Enc1 is expressed in the nuclear matrix of rat hippocampal neu-

rons but not at all in astrocytes. By searching an EST database for homologs of mouse *Enc1*, Hernandez et al. (1998) identified human *ENC1*. Northern blot analysis detected abundant expression of an approximately 4.5-kb *ENC1* transcript in brain, with lower expression in pancreas and no expression in other tissues. Within the central nervous system, expression was highest in cerebral cortex, frontal and temporal lobes, putamen, and spinal cord; lower expression was found in medulla and cerebellum, and very low levels of expression were found in the occipital pole. Low levels of *ENC1* were also detected in a variety of neural tumor cell lines. *ENC1* expression increased dramatically in a neuroblastoma cell line undergoing retinoic acid-induced differentiation. By differential display, Zhao et al. (2000) identified rat *Enc1* as a transcript associated with differentiation of rat preadipocytes in primary culture. Using the fragment identified by differential display as probe, they cloned full-length *Enc1* cDNA from a mouse brain cDNA library. By Northern blot analysis of rat tissues, Zhao et al. (2000) found high expression in brain, low expression in testis, and no expression in other tissues tested. They also found high expression of *Enc1* in the stroma-vascular fraction of adipose

tissue but very little in mature adipocyte fraction. Transient transfection in a 3T3 fibroblastic preadipocyte cell line resulted in subcellular colocalization with F-actin (OMIM Ref. No. 102560). Kim et al. (1998) showed that expression of ENC1 induced neuronal process formation, whereas antisense treatment inhibited neurite development. Immunoblot analysis showed that ENC1 can be phosphorylated and binds to the functionally active hypophosphorylated form of the nuclear matrix protein RB1 (OMIM Ref. No. 180200) during neuronal differentiation. Using primary cell culture of rat stroma-vascular cells, Zhao et al. (2000) found that transient early expression of Enc1 preceded the conversion of the fibroblastic preadipocytes to mature adipose. Enc1 expression also preceded expression of adipocyte-specific markers, including transcription factors known to activate adipocyte genes. Antisense transfection blocked differentiation to the mature adipocyte morphology.

[14306] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14307] Zhao, L.; Gregoire, F.; Sul, H. S. : Transient induction of ENC-1, a kelch-related actin-binding protein, is required

for adipocyte differentiation. J. Biol. Chem. 275:

16845–16850, 2000. ; and

[14308] Hernandez, M.-C.; Andres-Barquin, P. J.; Israel, M. A. : Assignment of the ectodermal-neural cortex 1 gene (Enc1) to mouse chromosome band 13D1 by fluorescence in situ hybridization. Cy.

[14309] Further studies establishing the function and utilities of ENC1 are found in John Hopkins OMIM database record ID 605173, and in cited publications numbered 2332–2335, 233 and 4795 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. F-box and WD-40 Domain Protein 1B (FBXW1B, Accession NM_012300) is another VGAM233 host target gene. FBXW1B BINDING SITE1 through FBXW1B BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FBXW1B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXW1B BINDING SITE1 through FBXW1B BINDING SITE3, designated SEQ ID:14662, SEQ ID:27364 and SEQ ID:27374 respectively, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ

ID:2944.

[14310] Another function of VGAM233 is therefore inhibition of F-box and WD-40 Domain Protein 1B (FBXW1B, Accession NM_012300), a gene which somehow is involved in the process of neuronal cell differentiation or brain development. Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXW1B. The function of FBXW1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM25.Protocadherin Gamma Subfamily A, 11

(PCDHGA11, Accession NM_018914) is another VGAM233 host target gene. PCDHGA11 BINDING SITE1 through PCDHGA11 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHGA11, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHGA11 BINDING SITE1 through PCDHGA11 BINDING SITE3, designated SEQ ID:20983, SEQ ID:25788 and SEQ ID:25789 respectively, to the nucleotide sequence of VGAM233 RNA, herein designated

VGAM RNA, also designated SEQ ID:2944.

[14311] Another function of VGAM233 is therefore inhibition of Protocadherin Gamma Subfamily A, 11 (PCDHGA11, Accession NM_018914). Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHGA11. Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112) is another VGAM233 host target gene. TRPS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPS1 BINDING SITE, designated SEQ ID:15349, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14312] Another function of VGAM233 is therefore inhibition of Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112), a gene which may function as a transcriptional activator protein. Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPS1. The function of TRPS1 and its association with various diseases

and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172.A Kinase (PRKA) Anchor Protein (yotiao) 9 (AKAP9, Accession NM_005751) is another VGAM233 host target gene. AKAP9 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AKAP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP9 BINDING SITE, designated SEQ ID:12313, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14313] Another function of VGAM233 is therefore inhibition of A Kinase (PRKA) Anchor Protein (yotiao) 9 (AKAP9, Accession NM_005751). Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP9. Rho GDP Dissociation Inhibitor (GDI) Gamma (ARHGDIG, Accession NM_001176) is another VGAM233 host target gene. ARHGDIG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARHGDIG, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGDIG BINDING SITE, designated SEQ ID:6851, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14314] Another function of VGAM233 is therefore inhibition of Rho GDP Dissociation Inhibitor (GDI) Gamma (ARHGDIG, Accession NM_001176). Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGDIG.

FLJ00001 (Accession XM_088525) is another VGAM233 host target gene. FLJ00001 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ00001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00001 BINDING SITE, designated SEQ ID:39776, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14315] Another function of VGAM233 is therefore inhibition of FLJ00001 (Accession XM_088525). Accordingly, utilities of

VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00001. FLJ13842 (Accession NM_024645) is another VGAM233 host target gene. FLJ13842 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13842 BINDING SITE, designated SEQ ID:23928, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14316] Another function of VGAM233 is therefore inhibition of FLJ13842 (Accession NM_024645). Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13842. Guanine Nucleotide Binding Protein (G protein), Gamma 4 (GNG4, Accession NM_004485) is another VGAM233 host target gene. GNG4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GNG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of GNG4 BINDING SITE, designated SEQ ID:10808, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14317] Another function of VGAM233 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Gamma 4 (GNG4, Accession NM_004485). Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNG4. Potassium Voltage-gated Channel, Delayed-rectifier, Sub-family S, Member 1 (KCNS1, Accession NM_002251) is another VGAM233 host target gene. KCNS1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCNS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNS1 BINDING SITE, designated SEQ ID:8042, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14318] Another function of VGAM233 is therefore inhibition of Potassium Voltage-gated Channel, Delayed-rectifier, Sub-family S, Member 1 (KCNS1, Accession NM_002251). Ac-

cordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNS1. KIAA0513 (Accession NM_014732) is another VGAM233 host target gene. KIAA0513 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0513, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0513 BINDING SITE, designated SEQ ID:16352, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14319] Another function of VGAM233 is therefore inhibition of KIAA0513 (Accession NM_014732). Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0513. KIAA0555 (Accession NM_014790) is another VGAM233 host target gene. KIAA0555 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0555, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0555 BINDING SITE, designated SEQ ID:16683, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14320] Another function of VGAM233 is therefore inhibition of KIAA0555 (Accession NM_014790). Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0555. KIAA1497 (Accession XM_041431) is another VGAM233 host target gene. KIAA1497 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1497, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1497 BINDING SITE, designated SEQ ID:33526, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14321] Another function of VGAM233 is therefore inhibition of KIAA1497 (Accession XM_041431). Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1497. Mannosidase, Alpha, Class 1C, Member 1 (MAN1C1, Accession NM_020379) is another VGAM233

host target gene. MAN1C1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAN1C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAN1C1 BINDING SITE, designated SEQ ID:21644, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14322] Another function of VGAM233 is therefore inhibition of Mannosidase, Alpha, Class 1C, Member 1 (MAN1C1, Accession NM_020379). Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAN1C1. LOC124402 (Accession NM_145253) is another VGAM233 host target gene. LOC124402 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124402, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124402 BINDING SITE, designated SEQ ID:29766, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA,

also designated SEQ ID:2944.

[14323] Another function of VGAM233 is therefore inhibition of LOC124402 (Accession NM_145253). Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124402. LOC142955 (Accession XM_084389) is another VGAM233 host target gene. LOC142955 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC142955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142955 BINDING SITE, designated SEQ ID:37573, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14324] Another function of VGAM233 is therefore inhibition of LOC142955 (Accession XM_084389). Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142955. LOC147054 (Accession XM_097172) is another VGAM233 host target gene. LOC147054 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147054, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147054 BINDING SITE, designated SEQ ID:40790, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14325] Another function of VGAM233 is therefore inhibition of LOC147054 (Accession XM_097172). Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147054. LOC150538 (Accession XM_086945) is another VGAM233 host target gene. LOC150538 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150538 BINDING SITE, designated SEQ ID:38991, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14326] Another function of VGAM233 is therefore inhibition of LOC150538 (Accession XM_086945). Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC150538. LOC153454 (Accession XM_087672) is another VGAM233 host target gene. LOC153454 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC153454, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153454 BINDING SITE, designated SEQ ID:39374, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14327] Another function of VGAM233 is therefore inhibition of LOC153454 (Accession XM_087672). Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153454. LOC196411 (Accession XM_113714) is another VGAM233 host target gene. LOC196411 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196411 BINDING SITE, designated SEQ ID:42363, to

the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14328] Another function of VGAM233 is therefore inhibition of LOC196411 (Accession XM_113714). Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196411. LOC200317 (Accession XM_114208) is another VGAM233 host target gene. LOC200317 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200317 BINDING SITE, designated SEQ ID:42802, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14329] Another function of VGAM233 is therefore inhibition of LOC200317 (Accession XM_114208). Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200317. LOC200609 (Accession XM_117256) is another VGAM233 host target gene. LOC200609 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC200609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200609 BINDING SITE, designated SEQ ID:43327, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14330] Another function of VGAM233 is therefore inhibition of LOC200609 (Accession XM_117256). Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200609. LOC203595 (Accession XM_119962) is another VGAM233 host target gene. LOC203595 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203595, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203595 BINDING SITE, designated SEQ ID:43605, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14331] Another function of VGAM233 is therefore inhibition of LOC203595 (Accession XM_119962). Accordingly, utilities

of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203595. LOC254196 (Accession XM_173220) is another VGAM233 host target gene. LOC254196 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254196 BINDING SITE, designated SEQ ID:46476, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14332] Another function of VGAM233 is therefore inhibition of LOC254196 (Accession XM_173220). Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254196. LOC255040 (Accession XM_172837) is another VGAM233 host target gene. LOC255040 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC255040 BINDING SITE, designated SEQ ID:46108, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14333] Another function of VGAM233 is therefore inhibition of LOC255040 (Accession XM_172837). Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255040. LOC255041 (Accession XM_172838) is another VGAM233 host target gene. LOC255041 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255041, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255041 BINDING SITE, designated SEQ ID:46111, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14334] Another function of VGAM233 is therefore inhibition of LOC255041 (Accession XM_172838). Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255041. LOC91907 (Accession XM_041430) is another VGAM233 host target gene. LOC91907 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91907, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91907 BINDING SITE, designated SEQ ID:33520, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:2944.

[14335] Another function of VGAM233 is therefore inhibition of LOC91907 (Accession XM_041430). Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91907. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 234 (VGAM234) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14336] VGAM234 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM234 was detected is described hereinabove with reference to Figs. 1-8.

[14337] VGAM234 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM234 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14338] VGAM234 gene encodes a VGAM234 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM234 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM234 precursor RNA is designated SEQ ID:220, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:220 is located at position 25253 relative to the genome of Callitrichine Herpesvirus 3.

[14339] VGAM234 precursor RNA folds onto itself, forming VGAM234 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[14340] An enzyme complex designated DICER COMPLEX, `dices` the VGAM234 folded precursor RNA into VGAM234 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM234 RNA is designated SEQ ID:2945, and is provided hereinbelow with reference to the sequence listing part.

[14341] VGAM234 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM234 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM234 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[14342] VGAM234 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM234 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM234 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM234 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM234 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[14343] The complementary binding of VGAM234 RNA, herein designated VGAM RNA, to host target binding sites on VGAM234 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM234 host target RNA into VGAM234 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14344] It is appreciated that VGAM234 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM234 host target genes. The mRNA of each one of this plurality of VGAM234 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM234 RNA, herein designated VGAM RNA, and which when bound by VGAM234 RNA causes inhibition of translation of respective one or more VGAM234 host target proteins.

[14345] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM234 gene, herein designated VGAM GENE, on one or more VGAM234 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[14346] It is yet further appreciated that a function of VGAM234 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM234 correlate with, and may be deduced from, the identity of the host target genes which VGAM234 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14347] Nucleotide sequences of the VGAM234 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM234 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM234 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM234 are further described hereinbelow with reference to Table 1.

[14348] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM234 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM234 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14349] As mentioned hereinabove with reference to Fig. 1, a function of VGAM234 gene, herein designated VGAM is inhibition of expression of VGAM234 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM234 correlate with, and may be deduced from, the identity of the target genes which VGAM234 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14350] Adenosine A1 Receptor (ADORA1, Accession NM_000674) is a VGAM234 host target gene. ADORA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADORA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of ADORA1 BINDING SITE, designated SEQ ID:6329, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14351] A function of VGAM234 is therefore inhibition of Adenosine A1 Receptor (ADORA1, Accession NM_000674), a gene which the activity of this receptor is mediated by G proteins which inhibit adenylyl cyclase. Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADORA1. The function of ADORA1 has been established by previous studies. Diverse physiologic effects of adenosine were recognized as early as the 1920s (Drury and Szent-Gyorgyi, 1929; Berne, 1963). Once released, adenosine activates adenosine receptors, which in turn regulate a diverse set of physiologic functions including cardiac rate and contractility, smooth muscle tone, sedation, release of neurotransmitters, platelet function, lipolysis, renal function, and white blood cell function. Stiles (1992) reviewed the structure and function of adenosine receptors important in the mediation of these multiple effects. Also see adenosine A2 receptor (ADORA2A; 102776). Libert et al. (1991) obtained cDNA clones for 4

receptors of the G protein-coupled receptor family by selective amplification of cloning from thyroid cDNA and termed them RDC1 (VIPR1; 192321), RDC4 (HTR1D; 182133), RDC7, and RDC8 (ADORA2A). RDC7 and RDC8 were identified as A1 and A2 adenosine receptors, respectively. By in situ hybridization, Libert et al. (1991) assigned the RDC7 gene to 22q11.2-q13.1. However, using fluorescence in situ hybridization, Townsend-Nicholson et al. (1995) demonstrated that the ADORA1 gene is located on 1q32.1. Animal model experiments lend further support to the function of ADORA1. Sun et al. (2001) used homologous recombination to generate viable mice without gross behavioral or anatomic defects that were deficient in the 2-exon A1ar gene, which encodes a protein 87% identical to the human protein.

[14352] It is appreciated that the abovementioned animal model for ADORA1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[14353] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14354] Stiles, G. L. : Adenosine receptors. J. Biol. Chem. 267:

6451–6454, 1992. ; and

[14355] Sun, D.; Samuelson, L. C.; Yang, T.; Huang, Y.; Paliege, A.; Saunders, T.; Briggs, J.; Schnermann, J. : Mediation of tubuloglomerular feedback by adenosine: evidence from mice lacking ad.

[14356] Further studies establishing the function and utilities of ADORA1 are found in John Hopkins OMIM database record ID 102775, and in cited publications numbered 12772–192 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CAMP Responsive Element Binding Protein–like 2 (CREBL2, Accession NM_001310) is another VGAM234 host target gene. CREBL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CREBL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CREBL2 BINDING SITE, designated SEQ ID:6997, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14357] Another function of VGAM234 is therefore inhibition of CAMP Responsive Element Binding Protein–like 2 (CREBL2,

Accession NM_001310). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CREBL2. Early Growth Response 2 (Krox-20 homolog, Drosophila) (EGR2, Accession NM_000399) is another VGAM234 host target gene. EGR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGR2 BINDING SITE, designated SEQ ID:5972, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14358] Another function of VGAM234 is therefore inhibition of Early Growth Response 2 (Krox-20 homolog, Drosophila) (EGR2, Accession NM_000399), a gene which binds to two specific dna sites located in the promoter region of hox-1.4. Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGR2. The function of EGR2 has been established by previous studies. Timmerman et al. (1999) screened 170 unrelated neuropathy patients and identified 2 with Dejerine-Sottas neuropathy (DSN;

145900) who had a heterozygous R359W mutation (129010.0004) in the alpha-helix domain of the first zinc finger of EGR2. Boerkoel et al. (2001) reported 2 additional DSN patients with the R359W mutation and suggested that it is the most common neuropathy-associated EGR2 mutation and consistently causes DSN. The expressivity ranged from that typical for DSN to a more rapidly progressive neuropathy that can cause death by age 6 years. Furthermore, in contrast to patients with typical DSN, patients with the EGR2 R359W mutation had more respiratory compromise and cranial nerve involvement. Animal model experiments lend further support to the function of EGR2. Congenital hypomyelinating neuropathy (CHN; 605253) is characterized clinically by early onset of hypotonia, areflexia, distal muscle weakness, and very slow nerve conduction velocities. Warner et al. (1997, 1998) noted that pathologic findings on sural nerve biopsies show hypomyelination of most or all fibers. Based on these findings, CHN is considered to be a result of congenital impairment in myelin formation. The disorder is inherited as an autosomal recessive. The EGR2 gene attracted the attention of Warner et al. (1997, 1998) as a potential candidate for CHN because of the expression

and knockout phenotype of its mouse homolog, Krox20. Krox20, a member of a multigene family of zinc finger proteins, is thought to function as an immediate early protein with basal expression in selected neuronal populations of the central and peripheral nervous systems. Krox20 knockout mice showed disrupted hindbrain segmentation and development and a block of Schwann cells at an early stage of differentiation as evidenced by the fact that the expression of early myelin genes, such as myelin-associated glycoprotein (OMIM Ref. No. 159460), are barely affected while the expression of the late myelin genes, myelin basic protein (OMIM Ref. No. 159430) and myelin protein zero (MPZ; 159440), are decreased or absent.

[14359] It is appreciated that the abovementioned animal model for EGR2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[14360] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14361] Timmerman, V.; De Jonghe, P.; Ceuterick, C.; De Vriendt, E.; Lofgren, A.; Nelis, E.; Warner, L. E.; Lupski, J. R.; Martin,

J.-J.; Van Broeckhoven, C. : Novel missense mutation in the early growth response 2 gene associated with Dejerine-Sottas syndrome phenotype. *Neurology* 52: 1827-1832, 1999. ; and

[14362] Warner, L. E.; Mancias, P.; Butler, I. J.; McDonald, C. M.; Keppen, L.; Koob, K. G.; Lupski, J. R. : Mutations in the early growth response 2 (EGR2) gene are associated with hereditary.

[14363] Further studies establishing the function and utilities of EGR2 are found in John Hopkins OMIM database record ID 129010, and in cited publications numbered 1167 and 12036-12043 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fms-related Tyrosine Kinase 1 (vascular endothelial growth factor/vascular permeability factor receptor) (FLT1, Accession NM_002019) is another VGAM234 host target gene. FLT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLT1 BINDING SITE, designated SEQ ID:7767, to the nucleotide sequence of VGAM234 RNA, herein des-

ignated VGAM RNA, also designated SEQ ID:2945.

[14364] Another function of VGAM234 is therefore inhibition of Fms-related Tyrosine Kinase 1 (vascular endothelial growth factor/vascular permeability factor receptor) (FLT1, Accession NM_002019). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLT1. GATA Binding Protein 3 (GATA3, Accession NM_002051) is another VGAM234 host target gene. GATA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GATA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GATA3 BINDING SITE, designated SEQ ID:7808, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14365] Another function of VGAM234 is therefore inhibition of GATA Binding Protein 3 (GATA3, Accession NM_002051). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GATA3. LAPTM5 (Accession NM_006762) is another VGAM234 host target gene. LAPTM5 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LAPTM5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAPTM5 BINDING SITE, designated SEQ ID:13619, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14366] Another function of VGAM234 is therefore inhibition of LAPTM5 (Accession NM_006762). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAPTM5. Platelet-derived Growth Factor Beta Polypeptide (simian sarcoma viral (v-sis) Oncogene Homolog) (PDGFB, Accession NM_002608) is another VGAM234 host target gene. PDGFB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDGFB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDGFB BINDING SITE, designated SEQ ID:8472, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14367] Another function of VGAM234 is therefore inhibition of Platelet-derived Growth Factor Beta Polypeptide (simian sarcoma viral (v-sis) Oncogene Homolog) (PDGFB, Accession NM_002608), a gene which plays an important role in stimulating adjacent cells to grow and thereby heal the wound. Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDGFB. The function of PDGFB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173. Solute Carrier Family 6 (neurotransmitter transporter, taurine), Member 6 (SLC6A6, Accession NM_003043) is another VGAM234 host target gene. SLC6A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC6A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A6 BINDING SITE, designated SEQ ID:9008, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14368] Another function of VGAM234 is therefore inhibition of

Solute Carrier Family 6 (neurotransmitter transporter, taurine), Member 6 (SLC6A6, Accession NM_003043), a gene which transports taurine and other beta-amino acids like beta-alanine. Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A6. The function of SLC6A6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM36. Tumor Necrosis Factor (ligand) Superfamily, Member 6 (TNFSF6, Accession NM_000639) is another VGAM234 host target gene. TNFSF6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFSF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF6 BINDING SITE, designated SEQ ID:6275, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14369] Another function of VGAM234 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 6 (TNFSF6, Accession NM_000639). Accordingly, utilities of

VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF6. Reserved (C8orf13, Accession XM_088377) is another VGAM234 host target gene. C8orf13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C8orf13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf13 BINDING SITE, designated SEQ ID:39659, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14370] Another function of VGAM234 is therefore inhibition of Reserved (C8orf13, Accession XM_088377). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf13. DKFZP434E2135 (Accession NM_030804) is another VGAM234 host target gene. DKFZP434E2135 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434E2135, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of DKFZP434E2135 BINDING SITE, designated SEQ ID:25120, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14371] Another function of VGAM234 is therefore inhibition of DKFZP434E2135 (Accession NM_030804). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434E2135. DKFZp762L0311 (Accession NM_018719) is another VGAM234 host target gene. DKFZp762L0311 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp762L0311, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762L0311 BINDING SITE, designated SEQ ID:20800, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14372] Another function of VGAM234 is therefore inhibition of DKFZp762L0311 (Accession NM_018719). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZp762L0311. Endothelial Cell-specific Molecule 1 (ESM1, Accession NM_007036) is another VGAM234 host target gene. ESM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ESM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESM1 BINDING SITE, designated SEQ ID:13914, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14373] Another function of VGAM234 is therefore inhibition of Endothelial Cell-specific Molecule 1 (ESM1, Accession NM_007036). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESM1. FLJ13798 (Accession XM_102377) is another VGAM234 host target gene. FLJ13798 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13798, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13798 BINDING SITE, designated SEQ

ID:42112, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14374] Another function of VGAM234 is therefore inhibition of FLJ13798 (Accession XM_102377). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13798. FLJ20047 (Accession NM_017639) is another VGAM234 host target gene. FLJ20047 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20047, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20047 BINDING SITE, designated SEQ ID:19145, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14375] Another function of VGAM234 is therefore inhibition of FLJ20047 (Accession NM_017639). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20047. G2 (Accession XM_039515) is another VGAM234 host target gene. G2 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by G2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G2 BINDING SITE, designated SEQ ID:33114, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14376] Another function of VGAM234 is therefore inhibition of G2 (Accession XM_039515). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G2.

KIAA0016 (Accession NM_014765) is another VGAM234 host target gene. KIAA0016 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0016, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0016 BINDING SITE, designated SEQ ID:16532, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14377] Another function of VGAM234 is therefore inhibition of KIAA0016 (Accession NM_014765). Accordingly, utilities

of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0016. KIAA1822 (Accession XM_041566) is another VGAM234 host target gene. KIAA1822 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1822, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1822 BINDING SITE, designated SEQ ID:33555, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14378] Another function of VGAM234 is therefore inhibition of KIAA1822 (Accession XM_041566). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1822. KOC1 (Accession XM_165847) is another VGAM234 host target gene. KOC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KOC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KOC1 BINDING SITE,

designated SEQ ID:43777, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14379] Another function of VGAM234 is therefore inhibition of KOC1 (Accession XM_165847). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KOC1. MEF-2 (Accession XM_034883) is another VGAM234 host target gene. MEF-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEF-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEF-2 BINDING SITE, designated SEQ ID:32182, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14380] Another function of VGAM234 is therefore inhibition of MEF-2 (Accession XM_034883). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEF-2. MGC20496 (Accession NM_052845) is another VGAM234 host target gene. MGC20496 BINDING SITE is HOST TAR-

GET binding site found in the 3' untranslated region of mRNA encoded by MGC20496, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20496 BINDING SITE, designated SEQ ID:27426, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14381] Another function of VGAM234 is therefore inhibition of MGC20496 (Accession NM_052845). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20496. N4BP3 (Accession XM_038920) is another VGAM234 host target gene. N4BP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by N4BP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of N4BP3 BINDING SITE, designated SEQ ID:32942, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14382] Another function of VGAM234 is therefore inhibition of

N4BP3 (Accession XM_038920). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with N4BP3. PTK6 Protein Tyrosine Kinase 6 (PTK6, Accession NM_005975) is another VGAM234 host target gene. PTK6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PTK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTK6 BINDING SITE, designated SEQ ID:12602, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14383] Another function of VGAM234 is therefore inhibition of PTK6 Protein Tyrosine Kinase 6 (PTK6, Accession NM_005975). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTK6. LOC145622 (Accession XM_085186) is another VGAM234 host target gene. LOC145622 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145622 BINDING SITE, designated SEQ ID:37903, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14384] Another function of VGAM234 is therefore inhibition of LOC145622 (Accession XM_085186). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145622. LOC154092 (Accession XM_098466) is another VGAM234 host target gene. LOC154092 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154092 BINDING SITE, designated SEQ ID:41683, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14385] Another function of VGAM234 is therefore inhibition of LOC154092 (Accession XM_098466). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC154092. LOC170063 (Accession XM_104820) is another VGAM234 host target gene. LOC170063 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC170063, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170063 BINDING SITE, designated SEQ ID:42185, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14386] Another function of VGAM234 is therefore inhibition of LOC170063 (Accession XM_104820). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170063. LOC205327 (Accession XM_115788) is another VGAM234 host target gene. LOC205327 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC205327, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC205327 BINDING SITE, designated SEQ ID:43106, to the nucleotide sequence of VGAM234 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2945.

[14387] Another function of VGAM234 is therefore inhibition of LOC205327 (Accession XM_115788). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205327. LOC221463 (Accession XM_166374) is another VGAM234 host target gene. LOC221463 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221463 BINDING SITE, designated SEQ ID:44206, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14388] Another function of VGAM234 is therefore inhibition of LOC221463 (Accession XM_166374). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221463. LOC221466 (Accession XM_168087) is another VGAM234 host target gene. LOC221466 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221466, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221466 BINDING SITE, designated SEQ ID:44997, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14389] Another function of VGAM234 is therefore inhibition of LOC221466 (Accession XM_168087). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221466. LOC51031 (Accession NM_016080) is another VGAM234 host target gene. LOC51031 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51031, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51031 BINDING SITE, designated SEQ ID:18154, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:2945.

[14390] Another function of VGAM234 is therefore inhibition of LOC51031 (Accession NM_016080). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC51031. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 235 (VGAM235) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14391] VGAM235 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM235 was detected is described hereinabove with reference to Figs. 1–8.

[14392] VGAM235 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM235 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14393] VGAM235 gene encodes a VGAM235 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM235 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM235 precursor RNA is designated SEQ

ID:221, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:221 is located at position 99717 relative to the genome of Calitrichine Herpesvirus 3.

[14394] VGAM235 precursor RNA folds onto itself, forming VGAM235 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14395] An enzyme complex designated DICER COMPLEX, `dices` the VGAM235 folded precursor RNA into VGAM235 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM235 RNA is designated SEQ ID:2946, and is provided hereinbelow with reference to the sequence

listing part.

[14396] VGAM235 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM235 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM235 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[14397] VGAM235 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM235 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM235 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM235 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM235 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[14398] The complementary binding of VGAM235 RNA, herein designated VGAM RNA, to host target binding sites on VGAM235 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM235 host target RNA into VGAM235 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14399] It is appreciated that VGAM235 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM235 host target genes. The mRNA of each one of this plurality of VGAM235 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM235 RNA, herein designated VGAM

RNA, and which when bound by VGAM235 RNA causes inhibition of translation of respective one or more VGAM235 host target proteins.

[14400] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM235 gene, herein designated VGAM GENE, on one or more VGAM235 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[14401] It is yet further appreciated that a function of VGAM235 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM235 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM235 correlate with, and may be deduced from, the identity of the host target genes which VGAM235 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14402] Nucleotide sequences of the VGAM235 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM235 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM235 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM235 are further described hereinbelow with reference to Table 1.

[14403] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM235 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM235 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14404] As mentioned hereinabove with reference to Fig. 1, a function of VGAM235 gene, herein designated VGAM is

inhibition of expression of VGAM235 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM235 correlate with, and may be deduced from, the identity of the target genes which VGAM235 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14405] Apolipoprotein L, 1 (APOL1, Accession NM_003661) is a VGAM235 host target gene. APOL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APOL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOL1 BINDING SITE, designated SEQ ID:9732, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:2946.

[14406] A function of VGAM235 is therefore inhibition of Apolipoprotein L, 1 (APOL1, Accession NM_003661), a gene which may participate in reverse cholesterol transport from peripheral cells to the liver. Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOL1. The function of APOL1 has been established by previous

studies. By genomic sequence analysis, Page et al. (2001) identified APOL1 within the APOL gene cluster. The predicted 398-amino acid protein has a calculated molecular mass of 43.9 kD. They noted that the APOL proteins share significant identity within the predicted amphipathic alpha helices. Semiquantitative RT-PCR revealed ubiquitous expression of APOL1, with highest levels in lung, spleen, prostate, and placenta, and weak expression in fetal brain and pancreas. In situ hybridization of human placenta revealed expression in all 3 tissue layers, including the basal plate, cytotrophoblast, and chorionic plate. In a microarray analysis of gene expression in the prefrontal cortex of schizophrenia (OMIM Ref. No. 181500) and control brains, Mimmack et al. (2002) found significant upregulation of the APOL1, APOL2 (OMIM Ref. No. 607252), and APOL4 (OMIM Ref. No. 607254) genes.

[14407] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14408] Mimmack, M. L.; Ryan, M.; Baba, H.; Navarro-Ruiz, J.; Iritani, S.; Faull, R. L. M.; McKenna, P. J.; Jones, P. B.; Arai, H.; Starkey, M.; Emson, P. C.; Bahn, S. : Gene expression analysis in schizophrenia: reproducible up-regulation of sev-

eral members of the apolipoprotein L family located in a high-susceptibility locus for schizophrenia on chromosome 22. Proc. Nat. Acad. Sci. 99: 4680–4685, 2002. ; and

- [14409] Page, N. M.; Butlin, D. J.; Lomthaisong, K.; Lowry, P. J. : The human apolipoprotein L gene cluster: identification, classification, and sites of distribution. Genomics 74: 71–78, 200.
- [14410] Further studies establishing the function and utilities of APOL1 are found in John Hopkins OMIM database record ID 603743, and in cited publications numbered 2899–290 and 4884–2902 listed in the bibliography section herein–below, which are also hereby incorporated by reference. 24-dehydrocholesterol Reductase (DHCR24, Accession NM_014762) is another VGAM235 host target gene. DHCR24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DHCR24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DHCR24 BINDING SITE, designated SEQ ID:16528, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ

ID:2946.

[14411] Another function of VGAM235 is therefore inhibition of 24-dehydrocholesterol Reductase (DHCR24, Accession NM_014762), a gene which catalyzes the reduction of sterol intermediates. Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DHCR24. The function of DHCR24 has been established by previous studies. Sarkar et al. (2001) showed that the gene encoding seladin-1, a human homolog of the Diminuto/Dwarf1 gene described in plants and *C. elegans*, has adenoma-specific overexpression. Northern blot analysis revealed that seladin-1 mRNA was overexpressed in the adenoma tissue of 14 patients with Cushing syndrome in comparison to the adjacent nontumorous adrenal gland. In situ hybridization using a seladin-1 cRNA probe showed its abundant expression in the tumor cells, whereas the nontumorous cells showed a low level of expression. Almost no apoptotic cell was detected in the tumor or in the normal adrenal cortex where seladin-1 expression was abundant. The authors noted that their results were compatible with a recent report that seladin-1 acts as an antiapoptotic factor in neurons (Greeve et al., 2000). In addition,

expression of seladin-1 in the normal adrenal cortex was most abundant in the zona fasciculata, suggesting its possible regulation by ACTH/cAMP. The authors concluded that the overexpression of seladin-1 in the adenoma could be due to the abundant expression of ACTH receptor and hypothesized that seladin-1 might be involved in the molecular events of adrenocortical tumorigenesis by facilitating steroid synthesis and cell growth. In a severely affected infant with desmosterolosis (OMIM Ref. No. 602398), Waterham et al. (2001) identified 3 mutations in the DHCR24 gene. The mutation inherited from the mother was a 1412A→C change resulting in a tyr471→ser (Y471S) substitution. Expression studies in *S. cerevisiae* showed nondetectable activity of this variant, consistent with the severe phenotype of the patient. Two mutations on the same allele were inherited from the father: an 881A→C change resulting in an asn294→thr substitution (N294T), and a 918G→C change resulting in a lys306→asn (K306N) substitution (606418.0002). Expression studies in *S. cerevisiae* of the N294T and K306N variants showed 14.4% and 49.8% of wildtype activity, respectively. Expression studies in *S. cerevisiae* of an allele with both mutations from the father showed less than 1%

of wildtype activity. To determine whether one of the mutations inherited from the father was a common polymorphic variant, 50 alleles of controls were analyzed but neither mutation was detected.

[14412] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

J. Clin. Endocr. Metab. 86: 5130–5137, 2001. ; and

[14414] Greeve, I.; Hermans-Borgmeyer, I.; Brellinger, C.; Kasper, D.; Gomez-Isla, T.; Behl, C.; Levkau, B.; Nitsch, R. M. : The human DIMINUTO/DWARF1 homolog seladin-1 confers resistance to A.

[14415] Further studies establishing the function and utilities of DHCR24 are found in John Hopkins OMIM database record ID 606418, and in cited publications numbered 676 and 6949 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Gamma-glutamyltransferase 2 (GGT2, Accession

XM_057166) is another VGAM235 host target gene. GGT2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GGT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGT2 BINDING SITE, designated SEQ ID:36488, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:2946.

[14416] Another function of VGAM235 is therefore inhibition of Gamma-glutamyltransferase 2 (GGT2, Accession XM_057166). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGT2. Kell Blood Group Precursor (McLeod phenotype) (XK, Accession NM_021083) is another VGAM235 host target gene. XK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XK BINDING SITE, designated SEQ ID:22059, to the nucleotide sequence of VGAM235 RNA, herein designated

VGAM RNA, also designated SEQ ID:2946.

[14417] Another function of VGAM235 is therefore inhibition of Kell Blood Group Precursor (McLeod phenotype) (XK, Accession NM_021083). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XK. DKFZp434C0328 (Accession NM_017577) is another VGAM235 host target gene. DKFZp434C0328 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434C0328, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434C0328 BINDING SITE, designated SEQ ID:19015, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:2946.

[14418] Another function of VGAM235 is therefore inhibition of DKFZp434C0328 (Accession NM_017577). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434C0328. FLJ21195 (Accession NM_022469) is another VGAM235 host target gene. FLJ21195 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21195 BINDING SITE, designated SEQ ID:22825, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:2946.

[14419] Another function of VGAM235 is therefore inhibition of FLJ21195 (Accession NM_022469). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21195. MEGF11 (Accession NM_032445) is another VGAM235 host target gene. MEGF11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MEGF11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEGF11 BINDING SITE, designated SEQ ID:26205, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:2946.

[14420] Another function of VGAM235 is therefore inhibition of

MEGF11 (Accession NM_032445). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEGF11. LOC153937 (Accession XM_087813) is another VGAM235 host target gene. LOC153937 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153937 BINDING SITE, designated SEQ ID:39449, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:2946.

[14421] Another function of VGAM235 is therefore inhibition of LOC153937 (Accession XM_087813). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153937. LOC85414 (Accession NM_033102) is another VGAM235 host target gene. LOC85414 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC85414, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC85414 BINDING SITE, designated SEQ ID:26954, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:2946.

[14422] Another function of VGAM235 is therefore inhibition of LOC85414 (Accession NM_033102). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC85414. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 236 (VGAM236) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14423] VGAM236 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM236 was detected is described hereinabove with reference to Figs. 1–8.

[14424] VGAM236 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM236 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[14425] VGAM236 gene encodes a VGAM236 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM236 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM236 precursor RNA is designated SEQ ID:222, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:222 is located at position 88403 relative to the genome of Calitrichine Herpesvirus 3.

[14426] VGAM236 precursor RNA folds onto itself, forming VGAM236 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14427] An enzyme complex designated DICER COMPLEX, `dices` the VGAM236 folded precursor RNA into VGAM236 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM236 RNA is designated SEQ ID:2947, and is provided hereinbelow with reference to the sequence listing part.

[14428] VGAM236 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM236 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM236 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[14429] VGAM236 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM236 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM236 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM236 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM236 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[14430] The complementary binding of VGAM236 RNA, herein designated VGAM RNA, to host target binding sites on VGAM236 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM236 host target RNA into VGAM236 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14431] It is appreciated that VGAM236 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM236 host target genes. The mRNA of each one of this plurality of VGAM236 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM236 RNA, herein designated VGAM RNA, and which when bound by VGAM236 RNA causes inhibition of translation of respective one or more VGAM236 host target proteins.

[14432] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM236 gene, herein designated VGAM GENE, on one or more VGAM236 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[14433] It is yet further appreciated that a function of VGAM236 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM236 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM236 correlate with, and may be deduced from, the identity of the host target genes which VGAM236 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14434] Nucleotide sequences of the VGAM236 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM236 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM236 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM236 are further described hereinbelow with reference to Table 1.

[14435] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM236 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM236 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14436] As mentioned hereinabove with reference to Fig. 1, a function of VGAM236 gene, herein designated VGAM is inhibition of expression of VGAM236 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM236 correlate with, and may be deduced from, the identity of the target genes which VGAM236 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14437] V-abl Abelson Murine Leukemia Viral Oncogene Homolog 1 (ABL1, Accession NM_005157) is a VGAM236 host target gene. ABL1 BINDING SITE1 and ABL1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABL1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABL1 BINDING SITE1 and ABL1 BINDING SITE2, designated SEQ ID:11636 and SEQ ID:14225 respectively, to the nucleotide sequence of

VGAM236 RNA, herein designated VGAM RNA, also designated SEQ ID:2947.

[14438] A function of VGAM236 is therefore inhibition of V-abl Abelson Murine Leukemia Viral Oncogene Homolog 1 (ABL1, Accession NM_005157). Accordingly, utilities of VGAM236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABL1. Sodium Channel, Voltage-gated, Type I, Alpha Polypeptide (SCN1A, Accession XM_114281) is another VGAM236 host target gene. SCN1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCN1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCN1A BINDING SITE, designated SEQ ID:42828, to the nucleotide sequence of VGAM236 RNA, herein designated VGAM RNA, also designated SEQ ID:2947.

[14439] Another function of VGAM236 is therefore inhibition of Sodium Channel, Voltage-gated, Type I, Alpha Polypeptide (SCN1A, Accession XM_114281). Accordingly, utilities of VGAM236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN1A.

Wolf–Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_014919) is another VGAM236 host target gene. WHSC1 BINDING SITE1 through WHSC1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WHSC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE1 through WHSC1 BINDING SITE3, designated SEQ ID:17174, SEQ ID:28438 and SEQ ID:28455 respectively, to the nucleotide sequence of VGAM236 RNA, herein designated VGAM RNA, also designated SEQ ID:2947.

[14440] Another function of VGAM236 is therefore inhibition of Wolf–Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_014919), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1. The function of WHSC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.Synaptojanin 2 (SYNJ2, Accession XM_029746) is another VGAM236 host target gene. SYNJ2 BINDING SITE

is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYNJ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNJ2 BINDING SITE, designated SEQ ID:30940, to the nucleotide sequence of VGAM236 RNA, herein designated VGAM RNA, also designated SEQ ID:2947.

[14441] Another function of VGAM236 is therefore inhibition of Synaptojanin 2 (SYNJ2, Accession XM_029746). Accordingly, utilities of VGAM236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNJ2. Synaptotagmin XIII (SYT13, Accession XM_167880) is another VGAM236 host target gene. SYT13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYT13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYT13 BINDING SITE, designated SEQ ID:44884, to the nucleotide sequence of VGAM236 RNA, herein designated VGAM RNA, also designated SEQ ID:2947.

[14442] Another function of VGAM236 is therefore inhibition of

Synaptotagmin XIII (SYT13, Accession XM_167880). Accordingly, utilities of VGAM236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT13. LOC152698 (Accession XM_017241) is another VGAM236 host target gene. LOC152698 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152698, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152698 BINDING SITE, designated SEQ ID:30311, to the nucleotide sequence of VGAM236 RNA, herein designated VGAM RNA, also designated SEQ ID:2947.

[14443] Another function of VGAM236 is therefore inhibition of LOC152698 (Accession XM_017241). Accordingly, utilities of VGAM236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152698. LOC157280 (Accession XM_058301) is another VGAM236 host target gene. LOC157280 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157280, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC157280 BINDING SITE, designated SEQ ID:36590, to the nucleotide sequence of VGAM236 RNA, herein designated VGAM RNA, also designated SEQ ID:2947.

[14444] Another function of VGAM236 is therefore inhibition of LOC157280 (Accession XM_058301). Accordingly, utilities of VGAM236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157280. LOC255448 (Accession XM_170623) is another VGAM236 host target gene. LOC255448 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255448, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255448 BINDING SITE, designated SEQ ID:45400, to the nucleotide sequence of VGAM236 RNA, herein designated VGAM RNA, also designated SEQ ID:2947.

[14445] Another function of VGAM236 is therefore inhibition of LOC255448 (Accession XM_170623). Accordingly, utilities of VGAM236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255448. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 237 (VGAM237) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14446] VGAM237 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM237 was detected is described hereinabove with reference to Figs. 1–8.

[14447] VGAM237 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM237 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14448] VGAM237 gene encodes a VGAM237 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM237 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM237 precursor RNA is designated SEQ ID:223, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:223 is

located at position 74899 relative to the genome of Calitrichine Herpesvirus 3.

[14449] VGAM237 precursor RNA folds onto itself, forming VGAM237 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14450] An enzyme complex designated DICER COMPLEX, `dices` the VGAM237 folded precursor RNA into VGAM237 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM237 RNA is designated SEQ ID:2948, and is provided hereinbelow with reference to the sequence listing part.

[14451] VGAM237 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM237 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM237 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[14452] VGAM237 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM237 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM237 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM237 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM237 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[14453] The complementary binding of VGAM237 RNA, herein designated VGAM RNA, to host target binding sites on VGAM237 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM237 host target RNA into VGAM237 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14454] It is appreciated that VGAM237 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM237 host target genes. The mRNA of each one of this plurality of VGAM237 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM237 RNA, herein designated VGAM RNA, and which when bound by VGAM237 RNA causes inhibition of translation of respective one or more VGAM237

host target proteins.

[14455] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM237 gene, herein designated VGAM GENE, on one or more VGAM237 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[14456] It is yet further appreciated that a function of VGAM237 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM237 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3.

Specific functions, and accordingly utilities, of VGAM237 correlate with, and may be deduced from, the identity of the host target genes which VGAM237 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [14457] Nucleotide sequences of the VGAM237 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM237 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM237 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM237 are further described hereinbelow with reference to Table 1.
- [14458] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM237 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM237 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [14459] As mentioned hereinabove with reference to Fig. 1, a function of VGAM237 gene, herein designated VGAM is inhibition of expression of VGAM237 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM237 correlate with, and may be deduced from, the identity of the target genes which VGAM237 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14460] Chemokine-like Receptor 1 (CMKLR1, Accession NM_004072) is a VGAM237 host target gene. CMKLR1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CMKLR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CMKLR1 BINDING SITE, designated SEQ ID:10276, to the nucleotide sequence of VGAM237 RNA, herein designated VGAM RNA, also designated SEQ ID:2948.

[14461] A function of VGAM237 is therefore inhibition of Chemokine-like Receptor 1 (CMKLR1, Accession NM_004072), a gene which may have a function in bone metabolism. Accordingly, utilities of VGAM237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CMKLR1. The function of CMKLR1 has been established by previous studies. Chemokines, a family of small cytokines, recruit leuko-

cytes during inflammation and immune responses.

Chemokine receptors, such as the somatostatin receptors (see, OMIM Ref. No., e.g., 182451), belong to the family of 7-transmembrane G protein-coupled receptors. Gantz et al. (1996) cloned CMKLR1 by PCR of genomic DNA with degenerate primers based on the conserved regions of somatostatin receptors 1–4. The predicted 371-amino acid protein has 7 hydrophobic domains. The CMKLR1 gene has over 40% nucleotide sequence homology to the somatostatin receptors 1–4 and over 50% to IL81R (OMIM Ref. No. 146929) and FPR1 (OMIM Ref. No. 136537).

Northern blot analysis revealed expression of multiple transcripts of different size in all tissues examined. Gantz et al. (1996) mapped the CMKLR1 gene to chromosome 12q24.1 by fluorescence in situ hybridization. While attempting to identify new neuropeptide receptors from a neuroblastoma x glioma cell line by RT-PCR with primers based on conserved regions of G protein-coupled neuropeptide receptors, Methner et al. (1997) cloned a mouse *Cmk1r1* cDNA, which they designated *Dez*. Using in situ hybridization, Methner et al. (1997) found that *Dez* is differentially regulated during mouse development, with prominent expression in developing osseous and carti-

luginous tissues. Owman et al. (1997) cloned the rat homolog, which they designated Cmkrl3, from a liver cDNA library. Using in situ hybridization, they found that Cmkrl3 is widely expressed in the brain and periphery, particularly in cardiovascular elements

[14462] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14463] Gantz, I.; Konda, Y.; Yang, Y.-K.; Miller, D. E.; Dierick, H. A.; Yamada, T. : Molecular cloning of a novel receptor (CMKLR1) with homology to the chemotactic factor receptors. Cytogenet. Cell Genet. 74: 286–290, 1996. ; and

[14464] Methner, A.; Hermey, G.; Schinke, B.; Hermans-Borgmeyer, I. : A novel G protein-coupled receptor with homology to neuropeptide and chemoattractant receptors expressed during bone develop.

[14465] Further studies establishing the function and utilities of CMKLR1 are found in John Hopkins OMIM database record ID 602351, and in cited publications numbered 1015–101 and 1018 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fibroblast Growth Factor 23 (FGF23, Accession NM_020638) is another VGAM237 host target gene.

FGF23 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGF23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF23 BINDING SITE, designated SEQ ID:21790, to the nucleotide sequence of VGAM237 RNA, herein designated VGAM RNA, also designated SEQ ID:2948.

[14466] Another function of VGAM237 is therefore inhibition of Fibroblast Growth Factor 23 (FGF23, Accession NM_020638), a gene which is a member of the fibroblast growth factor family. Accordingly, utilities of VGAM237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF23. The function of FGF23 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM24. Pim-1 Oncogene (PIM1, Accession XM_165800) is another VGAM237 host target gene. PIM1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIM1 BINDING SITE, designated SEQ ID:43755, to the nucleotide sequence of VGAM237 RNA, herein designated VGAM RNA, also designated SEQ ID:2948.

[14467] Another function of VGAM237 is therefore inhibition of Pim-1 Oncogene (PIM1, Accession XM_165800), a gene which is a protooncogene. Accordingly, utilities of VGAM237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIM1. The function of PIM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95. Thrombomodulin (THBD, Accession NM_000361) is another VGAM237 host target gene. THBD BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by THBD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THBD BINDING SITE, designated SEQ ID:5921, to the nucleotide sequence of VGAM237 RNA, herein designated VGAM RNA, also designated SEQ ID:2948.

[14468] Another function of VGAM237 is therefore inhibition of Thrombomodulin (THBD, Accession NM_000361). Accordingly, utilities of VGAM237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THBD. KIAA1056 (Accession NM_014894) is another VGAM237 host target gene. KIAA1056 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1056 BINDING SITE, designated SEQ ID:17044, to the nucleotide sequence of VGAM237 RNA, herein designated VGAM RNA, also designated SEQ ID:2948.

[14469] Another function of VGAM237 is therefore inhibition of KIAA1056 (Accession NM_014894). Accordingly, utilities of VGAM237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1056. LOC118786 (Accession XM_061147) is another VGAM237 host target gene. LOC118786 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC118786, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118786 BINDING SITE, designated SEQ ID:37198, to the nucleotide sequence of VGAM237 RNA, herein designated VGAM RNA, also designated SEQ ID:2948.

[14470] Another function of VGAM237 is therefore inhibition of LOC118786 (Accession XM_061147). Accordingly, utilities of VGAM237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118786. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 238 (VGAM238) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14471] VGAM238 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM238 was detected is described hereinabove with reference to Figs. 1-8.

[14472] VGAM238 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM238 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[14473] VGAM238 gene encodes a VGAM238 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM238 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM238 precursor RNA is designated SEQ ID:224, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:224 is located at position 31365 relative to the genome of Calitrichine Herpesvirus 3.

[14474] VGAM238 precursor RNA folds onto itself, forming VGAM238 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14475] An enzyme complex designated DICER COMPLEX, `dices` the VGAM238 folded precursor RNA into VGAM238 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM238 RNA is designated SEQ ID:2949, and is provided hereinbelow with reference to the sequence listing part.

[14476] VGAM238 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM238 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM238 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[14477] VGAM238 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM238 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM238 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM238 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM238 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[14478] The complementary binding of VGAM238 RNA, herein designated VGAM RNA, to host target binding sites on VGAM238 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM238 host target RNA into VGAM238 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[14479] It is appreciated that VGAM238 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM238 host target genes. The mRNA of each one of this plurality of VGAM238 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM238 RNA, herein designated VGAM RNA, and which when bound by VGAM238 RNA causes inhibition of translation of respective one or more VGAM238 host target proteins.

[14480] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM238 gene, herein designated VGAM GENE, on one or more VGAM238 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[14481] It is yet further appreciated that a function of VGAM238 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM238 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM238 correlate with, and may be deduced from, the identity of the host target genes which VGAM238 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14482] Nucleotide sequences of the VGAM238 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM238 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM238 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM238 are further described hereinbelow with reference to Table 1.

[14483] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM238 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM238 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14484] As mentioned hereinabove with reference to Fig. 1, a function of VGAM238 gene, herein designated VGAM is inhibition of expression of VGAM238 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM238 correlate with, and may be deduced from, the identity of the target genes which VGAM238 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14485] KIAA0441 (Accession NM_014797) is a VGAM238 host target gene. KIAA0441 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0441 BINDING SITE, designated SEQ ID:16706, to the nucleotide sequence of VGAM238 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2949.

[14486] A function of VGAM238 is therefore inhibition of KIAA0441 (Accession NM_014797). Accordingly, utilities of VGAM238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0441. KIAA0481 (Accession XM_050144) is another VGAM238 host target gene. KIAA0481 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0481, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0481 BINDING SITE, designated SEQ ID:35566, to the nucleotide sequence of VGAM238 RNA, herein designated VGAM RNA, also designated SEQ ID:2949.

[14487] Another function of VGAM238 is therefore inhibition of KIAA0481 (Accession XM_050144). Accordingly, utilities of VGAM238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0481. KIAA0721 (Accession XM_171125) is another VGAM238 host target gene. KIAA0721 BINDING SITE1 and KIAA0721 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by

KIAA0721, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0721 BINDING SITE1 and KIAA0721 BINDING SITE2, designated SEQ ID:45923 and SEQ ID:22316 respectively, to the nucleotide sequence of VGAM238 RNA, herein designated VGAM RNA, also designated SEQ ID:2949.

[14488] Another function of VGAM238 is therefore inhibition of KIAA0721 (Accession XM_171125). Accordingly, utilities of VGAM238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0721. LOC131870 (Accession XM_059544) is another VGAM238 host target gene. LOC131870 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC131870, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131870 BINDING SITE, designated SEQ ID:37014, to the nucleotide sequence of VGAM238 RNA, herein designated VGAM RNA, also designated SEQ ID:2949.

[14489] Another function of VGAM238 is therefore inhibition of

LOC131870 (Accession XM_059544). Accordingly, utilities of VGAM238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131870. LOC202018 (Accession XM_114420) is another VGAM238 host target gene. LOC202018 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202018 BINDING SITE, designated SEQ ID:42957, to the nucleotide sequence of VGAM238 RNA, herein designated VGAM RNA, also designated SEQ ID:2949.

[14490] Another function of VGAM238 is therefore inhibition of LOC202018 (Accession XM_114420). Accordingly, utilities of VGAM238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202018. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 239 (VGAM239) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[14491] VGAM239 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM239 was detected is described hereinabove with reference to Figs. 1–8.

[14492] VGAM239 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM239 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14493] VGAM239 gene encodes a VGAM239 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM239 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM239 precursor RNA is designated SEQ ID:225, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:225 is located at position 83602 relative to the genome of Callitrichine Herpesvirus 3.

[14494] VGAM239 precursor RNA folds onto itself, forming VGAM239 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[14495] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM239 folded precursor RNA into VGAM239 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 41%) nucleotide se-
quence of VGAM239 RNA is designated SEQ ID:2950, and
is provided hereinbelow with reference to the sequence
listing part.

[14496] VGAM239 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM239 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM239 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[14497] VGAM239 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM239 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM239 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM239 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM239 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[14498] The complementary binding of VGAM239 RNA, herein designated VGAM RNA, to host target binding sites on VGAM239 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM239 host target RNA into VGAM239 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14499] It is appreciated that VGAM239 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM239 host target genes. The mRNA of each one of this plurality of VGAM239 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM239 RNA, herein designated VGAM RNA, and which when bound by VGAM239 RNA causes inhibition of translation of respective one or more VGAM239 host target proteins.

[14500] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM239 gene, herein designated VGAM GENE, on one or

more VGAM239 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[14501] It is yet further appreciated that a function of VGAM239 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM239 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM239 correlate with, and may be deduced from, the identity of the host target genes which VGAM239 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14502] Nucleotide sequences of the VGAM239 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM239 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM239 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM239 are further described hereinbelow with reference to Table 1.

[14503] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM239 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM239 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14504] As mentioned hereinabove with reference to Fig. 1, a function of VGAM239 gene, herein designated VGAM is inhibition of expression of VGAM239 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM239 correlate with, and may be deduced from, the identity of the target genes which VGAM239 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14505] Neurocalcin Delta (NCALD, Accession NM_032041) is a

VGAM239 host target gene. NCALD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCALD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCALD BINDING SITE, designated SEQ ID:25741, to the nucleotide sequence of VGAM239 RNA, herein designated VGAM RNA, also designated SEQ ID:2950.

[14506] A function of VGAM239 is therefore inhibition of Neuro-calcin Delta (NCALD, Accession NM_032041). Accordingly, utilities of VGAM239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCALD. Chromosome 20 Open Reading Frame 20 (C20orf20, Accession NM_018270) is another VGAM239 host target gene. C20orf20 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf20 BINDING SITE, designated SEQ ID:20243, to the nucleotide sequence of VGAM239 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2950.

[14507] Another function of VGAM239 is therefore inhibition of Chromosome 20 Open Reading Frame 20 (C20orf20, Accession NM_018270). Accordingly, utilities of VGAM239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf20. DKFZP434I0714 (Accession XM_098247) is another VGAM239 host target gene. DKFZP434I0714 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434I0714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434I0714 BINDING SITE, designated SEQ ID:41527, to the nucleotide sequence of VGAM239 RNA, herein designated VGAM RNA, also designated SEQ ID:2950.

[14508] Another function of VGAM239 is therefore inhibition of DKFZP434I0714 (Accession XM_098247). Accordingly, utilities of VGAM239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434I0714. DKFZP564L0862 (Accession NM_024087) is another VGAM239 host target gene. DKFZP564L0862 BINDING SITE is HOST TARGET binding site

found in the 5` untranslated region of mRNA encoded by DKFZP564L0862, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564L0862 BINDING SITE, designated SEQ ID:23530, to the nucleotide sequence of VGAM239 RNA, herein designated VGAM RNA, also designated SEQ ID:2950.

[14509] Another function of VGAM239 is therefore inhibition of DKFZP564L0862 (Accession NM_024087). Accordingly, utilities of VGAM239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564L0862. KIAA1649 (Accession NM_032311) is another VGAM239 host target gene. KIAA1649 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1649, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1649 BINDING SITE, designated SEQ ID:26101, to the nucleotide sequence of VGAM239 RNA, herein designated VGAM RNA, also designated SEQ ID:2950.

[14510] Another function of VGAM239 is therefore inhibition of

KIAA1649 (Accession NM_032311). Accordingly, utilities of VGAM239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1649. PR Domain Containing 15 (PRDM15, Accession XM_029600) is another VGAM239 host target gene. PRDM15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRDM15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM15 BINDING SITE, designated SEQ ID:30915, to the nucleotide sequence of VGAM239 RNA, herein designated VGAM RNA, also designated SEQ ID:2950.

[14511] Another function of VGAM239 is therefore inhibition of PR Domain Containing 15 (PRDM15, Accession XM_029600). Accordingly, utilities of VGAM239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM15. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 240 (VGAM240) viral gene, which modulates expression of respective host tar-

get genes thereof, the function and utility of which host target genes is known in the art.

[14512] VGAM240 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM240 was detected is described hereinabove with reference to Figs. 1–8.

[14513] VGAM240 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM240 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14514] VGAM240 gene encodes a VGAM240 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM240 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM240 precursor RNA is designated SEQ ID:226, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:226 is located at position 32744 relative to the genome of Callitrichine Herpesvirus 3.

[14515] VGAM240 precursor RNA folds onto itself, forming VGAM240 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional
`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[14516] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM240 folded precursor RNA into VGAM240 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 41%) nucleotide se-
quence of VGAM240 RNA is designated SEQ ID:2951, and
is provided hereinbelow with reference to the sequence
listing part.

[14517] VGAM240 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM240 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM240 host target RNA comprises
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[14518] VGAM240 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM240 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM240 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM240 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM240 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[14519] The complementary binding of VGAM240 RNA, herein designated VGAM RNA, to host target binding sites on VGAM240 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM240 host target RNA into VGAM240 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14520] It is appreciated that VGAM240 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM240 host target genes. The mRNA of each one of this plurality of VGAM240 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM240 RNA, herein designated VGAM RNA, and which when bound by VGAM240 RNA causes inhibition of translation of respective one or more VGAM240 host target proteins.

[14521] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM240 gene, herein designated VGAM GENE, on one or more VGAM240 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[14522] It is yet further appreciated that a function of VGAM240 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM240 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM240 correlate with, and may be deduced from, the identity of the host target genes which VGAM240 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

- [14523] Nucleotide sequences of the VGAM240 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM240 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM240 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM240 are further described hereinbelow with reference to Table 1.
- [14524] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM240 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM240 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [14525] As mentioned hereinabove with reference to Fig. 1, a function of VGAM240 gene, herein designated VGAM is inhibition of expression of VGAM240 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM240 correlate with, and may be deduced from, the identity of the target genes which VGAM240 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14526] Cell Matrix Adhesion Regulator (CMAR, Accession NM_005200) is a VGAM240 host target gene. CMAR BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CMAR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CMAR BINDING SITE, designated SEQ ID:11698, to the nucleotide sequence of VGAM240 RNA, herein designated VGAM RNA, also designated SEQ ID:2951.

[14527] A function of VGAM240 is therefore inhibition of Cell Matrix Adhesion Regulator (CMAR, Accession NM_005200). Accordingly, utilities of VGAM240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CMAR. Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM_004009) is another VGAM240 host target gene. DMD BINDING SITE1 and DMD BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DMD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE1 and DMD

BINDING SITE2, designated SEQ ID:10167 and SEQ ID:10173 respectively, to the nucleotide sequence of VGAM240 RNA, herein designated VGAM RNA, also designated SEQ ID:2951.

[14528] Another function of VGAM240 is therefore inhibition of Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM_004009), a gene which muscular dystrophy . Accordingly, utilities of VGAM240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMD. The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM218.MGC22014 (Accession XM_035307) is another VGAM240 host target gene. MGC22014 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC22014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC22014 BINDING SITE, designated SEQ ID:32223, to the nucleotide sequence of VGAM240 RNA, herein designated VGAM RNA, also designated SEQ ID:2951.

[14529] Another function of VGAM240 is therefore inhibition of MGC22014 (Accession XM_035307). Accordingly, utilities of VGAM240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC22014. Serum/glucocorticoid Regulated Kinase-like (SGKL, Accession NM_013257) is another VGAM240 host target gene. SGKL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SGKL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SGKL BINDING SITE, designated SEQ ID:14929, to the nucleotide sequence of VGAM240 RNA, herein designated VGAM RNA, also designated SEQ ID:2951.

[14530] Another function of VGAM240 is therefore inhibition of Serum/glucocorticoid Regulated Kinase-like (SGKL, Accession NM_013257). Accordingly, utilities of VGAM240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SGKL. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 241

(VGAM241) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14531] VGAM241 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM241 was detected is described hereinabove with reference to Figs. 1–8.

[14532] VGAM241 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM241 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14533] VGAM241 gene encodes a VGAM241 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM241 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM241 precursor RNA is designated SEQ ID:227, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:227 is located at position 21896 relative to the genome of Callitrichine Herpesvirus 3.

[14534] VGAM241 precursor RNA folds onto itself, forming

VGAM241 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14535] An enzyme complex designated DICER COMPLEX, `dices` the VGAM241 folded precursor RNA into VGAM241 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM241 RNA is designated SEQ ID:2952, and is provided hereinbelow with reference to the sequence listing part.

[14536] VGAM241 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM241 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM241 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[14537] VGAM241 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM241 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM241 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM241 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM241 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[14538] The complementary binding of VGAM241 RNA, herein designated VGAM RNA, to host target binding sites on VGAM241 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM241 host target RNA into VGAM241 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14539] It is appreciated that VGAM241 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM241 host target genes. The mRNA of each one of this plurality of VGAM241 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM241 RNA, herein designated VGAM RNA, and which when bound by VGAM241 RNA causes inhibition of translation of respective one or more VGAM241 host target proteins.

[14540] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM241 gene, herein designated VGAM GENE, on one or more VGAM241 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[14541] It is yet further appreciated that a function of VGAM241 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM241 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM241 correlate with, and may be deduced from, the identity of the host target genes which VGAM241 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[14542] Nucleotide sequences of the VGAM241 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM241 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM241 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM241 are further described hereinbelow with reference to Table 1.

[14543] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM241 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM241 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14544] As mentioned hereinabove with reference to Fig. 1, a function of VGAM241 gene, herein designated VGAM is inhibition of expression of VGAM241 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM241 correlate with, and may be deduced from, the identity of the target genes which VGAM241 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[14545] Cystinosis, Nephropathic (CTNS, Accession NM_004937) is a VGAM241 host target gene. CTNS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CTNS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTNS BINDING SITE, designated SEQ ID:11381, to the nucleotide sequence of VGAM241 RNA, herein designated VGAM RNA, also designated SEQ ID:2952.

[14546] A function of VGAM241 is therefore inhibition of Cystinosis, Nephropathic (CTNS, Accession NM_004937). Accordingly, utilities of VGAM241 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTNS. RAS Guanyl Releasing Protein 1 (calcium and DAG-regulated) (RASGRP1, Accession NM_005739) is another VGAM241 host target gene. RASGRP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASGRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of RASGRP1 BINDING SITE, designated SEQ ID:12300, to the nucleotide sequence of VGAM241 RNA, herein designated VGAM RNA, also designated SEQ ID:2952.

[14547] Another function of VGAM241 is therefore inhibition of RAS Guanyl Releasing Protein 1 (calcium and DAG-regulated) (RASGRP1, Accession NM_005739). Accordingly, utilities of VGAM241 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASGRP1. X-ray Repair Complementing Defective Repair In Chinese Hamster Cells 2 (XRCC2, Accession NM_005431) is another VGAM241 host target gene. XRCC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XRCC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XRCC2 BINDING SITE, designated SEQ ID:11899, to the nucleotide sequence of VGAM241 RNA, herein designated VGAM RNA, also designated SEQ ID:2952.

[14548] Another function of VGAM241 is therefore inhibition of X-ray Repair Complementing Defective Repair In Chinese

Hamster Cells 2 (XRCC2, Accession NM_005431), a gene which involves in the homologous recombination repair (hrr) pathway of double-stranded dna. Accordingly, utilities of VGAM241 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XRCC2. The function of XRCC2 has been established by previous studies. Johnson et al. (1999) demonstrated that XRCC2 is essential for the efficient repair of DNA double-strand breaks by homologous recombination between sister chromatids. Hamster cells deficient in XRCC2 showed a more than 100-fold decrease in homologous recombination induced by double-strand breaks compared with the parental cell line. This defect was corrected to almost wildtype levels by transient transfection with a plasmid expressing XRCC2. The repair defect in XRCC2 mutant cells appeared to be restricted to recombinational repair because nonhomologous end joining was normal. Johnson et al. (1999) concluded that XRCC2 is involved in the repair of DNA double-strand breaks by homologous recombination. Using a yeast 2-hybrid assay, Braybrooke et al. (2000) identified a direct interaction between XRCC2 and RAD51L3 (OMIM Ref. No. 602954), and they confirmed the interaction by pull-down assays between recombinant

XRCC2 and endogenous RAD51L3 in HeLa cell extracts. Size-exclusion chromatography followed by Western blot analysis suggested that the 2 proteins exist as a heterodimer of about 70 kD.

[14549] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14550] Johnson, R. D.; Liu, N.; Jasin, M. : Mammalian XRCC2 promotes the repair of DNA double-strand breaks by homologous recombination. *Nature* 401: 397–399, 1999. ; and

[14551] Braybrooke, J. P.; Spink, K. G.; Thacker, J.; Hickson, I. D. : The RAD51 family member, RAD51L3, is a DNA-stimulated ATPase that forms a complex with XRCC2. *J. Biol. Chem.* 275: 29100–29.

[14552] Further studies establishing the function and utilities of XRCC2 are found in John Hopkins OMIM database record ID 600375, and in cited publications numbered 1597–1605 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP434O047 (Accession NM_015594) is another VGAM241 host target gene. DKFZP434O047 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434O047, correspond–

ing to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434O047 BINDING SITE, designated SEQ ID:17858, to the nucleotide sequence of VGAM241 RNA, herein designated VGAM RNA, also designated SEQ ID:2952.

[14553] Another function of VGAM241 is therefore inhibition of DKFZP434O047 (Accession NM_015594). Accordingly, utilities of VGAM241 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434O047. F-box Only Protein 9 (FBXO9, Accession NM_033480) is another VGAM241 host target gene. FBXO9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXO9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO9 BINDING SITE, designated SEQ ID:27259, to the nucleotide sequence of VGAM241 RNA, herein designated VGAM RNA, also designated SEQ ID:2952.

[14554] Another function of VGAM241 is therefore inhibition of F-box Only Protein 9 (FBXO9, Accession NM_033480). Ac-

cordingly, utilities of VGAM241 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO9. FLJ21940 (Accession NM_022828) is another VGAM241 host target gene. FLJ21940 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21940 BINDING SITE, designated SEQ ID:23106, to the nucleotide sequence of VGAM241 RNA, herein designated VGAM RNA, also designated SEQ ID:2952.

[14555] Another function of VGAM241 is therefore inhibition of FLJ21940 (Accession NM_022828). Accordingly, utilities of VGAM241 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21940. FLJ22031 (Accession NM_025074) is another VGAM241 host target gene. FLJ22031 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22031, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22031 BINDING SITE,

designated SEQ ID:24675, to the nucleotide sequence of VGAM241 RNA, herein designated VGAM RNA, also designated SEQ ID:2952.

[14556] Another function of VGAM241 is therefore inhibition of FLJ22031 (Accession NM_025074). Accordingly, utilities of VGAM241 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22031. Interferon Regulatory Factor 7 (IRF7, Accession NM_004030) is another VGAM241 host target gene. IRF7 BINDING SITE1 through IRF7 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by IRF7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRF7 BINDING SITE1 through IRF7 BINDING SITE4, designated SEQ ID:10250, SEQ ID:7302, SEQ ID:10252 and SEQ ID:10248 respectively, to the nucleotide sequence of VGAM241 RNA, herein designated VGAM RNA, also designated SEQ ID:2952.

[14557] Another function of VGAM241 is therefore inhibition of Interferon Regulatory Factor 7 (IRF7, Accession NM_004030). Accordingly, utilities of VGAM241 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with IRF7. KIAA1431 (Accession XM_032055) is another VGAM241 host target gene.

KIAA1431 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1431, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1431 BINDING SITE, designated SEQ ID:31550, to the nucleotide sequence of VGAM241 RNA, herein designated VGAM RNA, also designated SEQ ID:2952.

[14558] Another function of VGAM241 is therefore inhibition of KIAA1431 (Accession XM_032055). Accordingly, utilities of VGAM241 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1431. PP1628 (Accession NM_025201) is another VGAM241 host target gene. PP1628 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PP1628, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP1628 BINDING

SITE, designated SEQ ID:24854, to the nucleotide sequence of VGAM241 RNA, herein designated VGAM RNA, also designated SEQ ID:2952.

[14559] Another function of VGAM241 is therefore inhibition of PP1628 (Accession NM_025201). Accordingly, utilities of VGAM241 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP1628. QKI (Accession XM_037438) is another VGAM241 host target gene. QKI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by QKI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of QKI BINDING SITE, designated SEQ ID:32615, to the nucleotide sequence of VGAM241 RNA, herein designated VGAM RNA, also designated SEQ ID:2952.

[14560] Another function of VGAM241 is therefore inhibition of QKI (Accession XM_037438). Accordingly, utilities of VGAM241 include diagnosis, prevention and treatment of diseases and clinical conditions associated with QKI. Sero-logically Defined Colon Cancer Antigen 33 (SDCCAG33, Accession NM_005786) is another VGAM241 host target gene. SDCCAG33 BINDING SITE is HOST TARGET binding

site found in the 5` untranslated region of mRNA encoded by SDCCAG33, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDCCAG33 BINDING SITE, designated SEQ ID:12369, to the nucleotide sequence of VGAM241 RNA, herein designated VGAM RNA, also designated SEQ ID:2952.

[14561] Another function of VGAM241 is therefore inhibition of Serologically Defined Colon Cancer Antigen 33 (SDCCAG33, Accession NM_005786). Accordingly, utilities of VGAM241 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDCCAG33. Syntrophin (SNPH, Accession NM_014723) is another VGAM241 host target gene. SNPH BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SNPH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNPH BINDING SITE, designated SEQ ID:16300, to the nucleotide sequence of VGAM241 RNA, herein designated VGAM RNA, also designated SEQ ID:2952.

[14562] Another function of VGAM241 is therefore inhibition of Syntaphilin (SNPH, Accession NM_014723). Accordingly, utilities of VGAM241 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNPH. LOC145644 (Accession XM_035608) is another VGAM241 host target gene. LOC145644 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145644, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145644 BINDING SITE, designated SEQ ID:32288, to the nucleotide sequence of VGAM241 RNA, herein designated VGAM RNA, also designated SEQ ID:2952.

[14563] Another function of VGAM241 is therefore inhibition of LOC145644 (Accession XM_035608). Accordingly, utilities of VGAM241 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145644. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 242 (VGAM242) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[14564] VGAM242 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM242 was detected is described hereinabove with reference to Figs. 1–8.

[14565] VGAM242 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM242 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14566] VGAM242 gene encodes a VGAM242 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM242 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM242 precursor RNA is designated SEQ ID:228, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:228 is located at position 102669 relative to the genome of Callitrichine Herpesvirus 3.

[14567] VGAM242 precursor RNA folds onto itself, forming VGAM242 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional
`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[14568] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM242 folded precursor RNA into VGAM242 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 49%) nucleotide se-
quence of VGAM242 RNA is designated SEQ ID:2953, and
is provided hereinbelow with reference to the sequence
listing part.

[14569] VGAM242 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM242 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM242 host target RNA comprises
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[14570] VGAM242 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM242 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM242 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM242 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM242 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[14571] The complementary binding of VGAM242 RNA, herein designated VGAM RNA, to host target binding sites on VGAM242 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM242 host target RNA into VGAM242 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14572] It is appreciated that VGAM242 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM242 host target genes. The mRNA of each one of this plurality of VGAM242 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM242 RNA, herein designated VGAM RNA, and which when bound by VGAM242 RNA causes inhibition of translation of respective one or more VGAM242 host target proteins.

[14573] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM242 gene, herein designated VGAM GENE, on one or more VGAM242 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[14574] It is yet further appreciated that a function of VGAM242 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM242 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM242 correlate with, and may be deduced from, the identity of the host target genes which VGAM242 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

- [14575] Nucleotide sequences of the VGAM242 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM242 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM242 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM242 are further described hereinbelow with reference to Table 1.
- [14576] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM242 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM242 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [14577] As mentioned hereinabove with reference to Fig. 1, a function of VGAM242 gene, herein designated VGAM is inhibition of expression of VGAM242 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM242 correlate with, and may be deduced from, the identity of the target genes which VGAM242 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14578] Adenylate Cyclase 6 (ADCY6, Accession NM_015270) is a VGAM242 host target gene. ADCY6 BINDING SITE1 and ADCY6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADCY6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY6 BINDING SITE1 and ADCY6 BINDING SITE2, designated SEQ ID:17587 and SEQ ID:21975 respectively, to the nucleotide sequence of VGAM242 RNA, herein designated VGAM RNA, also designated SEQ ID:2953.

[14579] A function of VGAM242 is therefore inhibition of Adenylate Cyclase 6 (ADCY6, Accession NM_015270), a gene which this a membrane-bound, Ca^{2+} -inhibitable adenylyl cyclase (by similarity). Accordingly, utilities of VGAM242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY6. The function of ADCY6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM22. Frizzled Homolog 10 (Drosophila) (FZD10, Accession NM_007197) is another VGAM242 host target

gene. FZD10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FZD10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FZD10 BINDING SITE, designated SEQ ID:14051, to the nucleotide sequence of VGAM242 RNA, herein designated VGAM RNA, also designated SEQ ID:2953.

[14580] Another function of VGAM242 is therefore inhibition of Frizzled Homolog 10 (Drosophila) (FZD10, Accession NM_007197). Accordingly, utilities of VGAM242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FZD10. Homeo Box C4 (HOXC4, Accession NM_014620) is another VGAM242 host target gene. HOXC4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HOXC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXC4 BINDING SITE, designated SEQ ID:15973, to the nucleotide sequence of VGAM242 RNA, herein designated VGAM RNA, also designated SEQ

ID:2953.

[14581] Another function of VGAM242 is therefore inhibition of Homeo Box C4 (HOXC4, Accession NM_014620), a gene which is part of a developmental regulatory system that provides cells with specific positional identities on the anterior-posterior axis. Accordingly, utilities of VGAM242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXC4. The function of HOXC4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.DnaJ (Hsp40) Homolog, Subfamily B, Member 5 (DNAJB5, Accession NM_012266) is another VGAM242 host target gene. DNAJB5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNAJB5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAJB5 BINDING SITE, designated SEQ ID:14588, to the nucleotide sequence of VGAM242 RNA, herein designated VGAM RNA, also designated SEQ ID:2953.

[14582] Another function of VGAM242 is therefore inhibition of

DnaJ (Hsp40) Homolog, Subfamily B, Member 5 (DNAJB5, Accession NM_012266). Accordingly, utilities of VGAM242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJB5. DRIL2 (Accession NM_006465) is another VGAM242 host target gene. DRIL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DRIL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DRIL2 BINDING SITE, designated SEQ ID:13185, to the nucleotide sequence of VGAM242 RNA, herein designated VGAM RNA, also designated SEQ ID:2953.

[14583] Another function of VGAM242 is therefore inhibition of DRIL2 (Accession NM_006465). Accordingly, utilities of VGAM242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRIL2. KIAA0418 (Accession NM_014631) is another VGAM242 host target gene. KIAA0418 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0418, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0418 BINDING SITE, designated SEQ ID:15996, to the nucleotide sequence of VGAM242 RNA, herein designated VGAM RNA, also designated SEQ ID:2953.

[14584] Another function of VGAM242 is therefore inhibition of KIAA0418 (Accession NM_014631). Accordingly, utilities of VGAM242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0418. Phosphatidylinositol-4-phosphate 5-kinase, Type II, Beta (PIP5K2B, Accession NM_003559) is another VGAM242 host target gene. PIP5K2B BINDING SITE1 and PIP5K2B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PIP5K2B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP5K2B BINDING SITE1 and PIP5K2B BINDING SITE2, designated SEQ ID:9608 and SEQ ID:9609 respectively, to the nucleotide sequence of VGAM242 RNA, herein designated VGAM RNA, also designated SEQ ID:2953.

[14585] Another function of VGAM242 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, Type II, Beta

(PIP5K2B, Accession NM_003559). Accordingly, utilities of VGAM242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K2B. Retinoic Acid Induced 15 (RAI15, Accession XM_039548) is another VGAM242 host target gene. RAI15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAI15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI15 BINDING SITE, designated SEQ ID:33118, to the nucleotide sequence of VGAM242 RNA, herein designated VGAM RNA, also designated SEQ ID:2953.

[14586] Another function of VGAM242 is therefore inhibition of Retinoic Acid Induced 15 (RAI15, Accession XM_039548). Accordingly, utilities of VGAM242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI15. SEC14-like 2 (*S. cerevisiae*) (SEC14L2, Accession NM_012429) is another VGAM242 host target gene. SEC14L2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEC14L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC14L2 BINDING SITE, designated SEQ ID:14805, to the nucleotide sequence of VGAM242 RNA, herein designated VGAM RNA, also designated SEQ ID:2953.

[14587] Another function of VGAM242 is therefore inhibition of SEC14-like 2 (*S. cerevisiae*) (SEC14L2, Accession NM_012429). Accordingly, utilities of VGAM242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC14L2. LOC127534 (Accession XM_060532) is another VGAM242 host target gene. LOC127534 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127534 BINDING SITE, designated SEQ ID:37167, to the nucleotide sequence of VGAM242 RNA, herein designated VGAM RNA, also designated SEQ ID:2953.

[14588] Another function of VGAM242 is therefore inhibition of LOC127534 (Accession XM_060532). Accordingly, utilities of VGAM242 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC127534. LOC143916 (Accession XM_084664) is another VGAM242 host target gene. LOC143916 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143916, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143916 BINDING SITE, designated SEQ ID:37650, to the nucleotide sequence of VGAM242 RNA, herein designated VGAM RNA, also designated SEQ ID:2953.

[14589] Another function of VGAM242 is therefore inhibition of LOC143916 (Accession XM_084664). Accordingly, utilities of VGAM242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143916. LOC253917 (Accession XM_171832) is another VGAM242 host target gene. LOC253917 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253917, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253917 BINDING SITE, designated SEQ ID:46065, to

the nucleotide sequence of VGAM242 RNA, herein designated VGAM RNA, also designated SEQ ID:2953.

[14590] Another function of VGAM242 is therefore inhibition of LOC253917 (Accession XM_171832). Accordingly, utilities of VGAM242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253917. LOC92568 (Accession XM_045852) is another VGAM242 host target gene. LOC92568 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92568, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92568 BINDING SITE, designated SEQ ID:34577, to the nucleotide sequence of VGAM242 RNA, herein designated VGAM RNA, also designated SEQ ID:2953.

[14591] Another function of VGAM242 is therefore inhibition of LOC92568 (Accession XM_045852). Accordingly, utilities of VGAM242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92568. LOC93589 (Accession XM_052387) is another VGAM242 host target gene. LOC93589 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC93589, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93589 BINDING SITE, designated SEQ ID:35978, to the nucleotide sequence of VGAM242 RNA, herein designated VGAM RNA, also designated SEQ ID:2953.

[14592] Another function of VGAM242 is therefore inhibition of LOC93589 (Accession XM_052387). Accordingly, utilities of VGAM242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93589. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 243 (VGAM243) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14593] VGAM243 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM243 was detected is described hereinabove with reference to Figs. 1–8.

[14594] VGAM243 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Callitrichine Herpesvirus 3. VGAM243 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14595] VGAM243 gene encodes a VGAM243 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM243 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM243 precursor RNA is designated SEQ ID:229, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:229 is located at position 30312 relative to the genome of Callitrichine Herpesvirus 3.

[14596] VGAM243 precursor RNA folds onto itself, forming VGAM243 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14597] An enzyme complex designated DICER COMPLEX, `dices` the VGAM243 folded precursor RNA into VGAM243 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM243 RNA is designated SEQ ID:2954, and is provided hereinbelow with reference to the sequence listing part.

[14598] VGAM243 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM243 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM243 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[14599] VGAM243 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM243 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM243 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM243 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM243 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[14600] The complementary binding of VGAM243 RNA, herein designated VGAM RNA, to host target binding sites on VGAM243 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM243 host tar-

get RNA into VGAM243 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14601] It is appreciated that VGAM243 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM243 host target genes. The mRNA of each one of this plurality of VGAM243 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM243 RNA, herein designated VGAM RNA, and which when bound by VGAM243 RNA causes inhibition of translation of respective one or more VGAM243 host target proteins.

[14602] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM243 gene, herein designated VGAM GENE, on one or more VGAM243 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[14603] It is yet further appreciated that a function of VGAM243 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM243 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM243 correlate with, and may be deduced from, the identity of the host target genes which VGAM243 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14604] Nucleotide sequences of the VGAM243 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM243 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM243 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM243 are further

described hereinbelow with reference to Table 1.

[14605] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM243 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM243 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14606] As mentioned hereinabove with reference to Fig. 1, a function of VGAM243 gene, herein designated VGAM is inhibition of expression of VGAM243 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM243 correlate with, and may be deduced from, the identity of the target genes which VGAM243 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14607] Kinesin Family Member 3C (KIF3C, Accession NM_002254) is a VGAM243 host target gene. KIF3C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIF3C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIF3C BIND-

ING SITE, designated SEQ ID:8060, to the nucleotide sequence of VGAM243 RNA, herein designated VGAM RNA, also designated SEQ ID:2954.

[14608] A function of VGAM243 is therefore inhibition of Kinesin Family Member 3C (KIF3C, Accession NM_002254). Accordingly, utilities of VGAM243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF3C. KIAA1828 (Accession XM_057526) is another VGAM243 host target gene. KIAA1828 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1828, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1828 BINDING SITE, designated SEQ ID:36524, to the nucleotide sequence of VGAM243 RNA, herein designated VGAM RNA, also designated SEQ ID:2954.

[14609] Another function of VGAM243 is therefore inhibition of KIAA1828 (Accession XM_057526). Accordingly, utilities of VGAM243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1828. Kv6.3 (Accession NM_133490) is another VGAM243 host target gene. Kv6.3 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by Kv6.3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Kv6.3 BINDING SITE, designated SEQ ID:28564, to the nucleotide sequence of VGAM243 RNA, herein designated VGAM RNA, also designated SEQ ID:2954.

[14610] Another function of VGAM243 is therefore inhibition of Kv6.3 (Accession NM_133490). Accordingly, utilities of VGAM243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Kv6.3. Matrin 3 (MATR3, Accession NM_018834) is another VGAM243 host target gene. MATR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MATR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MATR3 BINDING SITE, designated SEQ ID:20819, to the nucleotide sequence of VGAM243 RNA, herein designated VGAM RNA, also designated SEQ ID:2954.

[14611] Another function of VGAM243 is therefore inhibition of

Matrin 3 (MATR3, Accession NM_018834). Accordingly, utilities of VGAM243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MATR3. RRN3 (Accession NM_018427) is another VGAM243 host target gene. RRN3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RRN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RRN3 BINDING SITE, designated SEQ ID:20486, to the nucleotide sequence of VGAM243 RNA, herein designated VGAM RNA, also designated SEQ ID:2954.

[14612] Another function of VGAM243 is therefore inhibition of RRN3 (Accession NM_018427). Accordingly, utilities of VGAM243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RRN3. LOC253039 (Accession XM_171203) is another VGAM243 host target gene. LOC253039 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253039, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253039 BINDING SITE, designated SEQ ID:20487, to the nucleotide sequence of VGAM243 RNA, herein designated VGAM RNA, also designated SEQ ID:2955.

tarity of the nucleotide sequences of LOC253039 BINDING SITE, designated SEQ ID:45993, to the nucleotide sequence of VGAM243 RNA, herein designated VGAM RNA, also designated SEQ ID:2954.

[14613] Another function of VGAM243 is therefore inhibition of LOC253039 (Accession XM_171203). Accordingly, utilities of VGAM243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253039. LOC51634 (Accession NM_016024) is another VGAM243 host target gene. LOC51634 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51634, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51634 BINDING SITE, designated SEQ ID:18100, to the nucleotide sequence of VGAM243 RNA, herein designated VGAM RNA, also designated SEQ ID:2954.

[14614] Another function of VGAM243 is therefore inhibition of LOC51634 (Accession NM_016024). Accordingly, utilities of VGAM243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51634. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 244 (VGAM244) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14615] VGAM244 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM244 was detected is described hereinabove with reference to Figs. 1–8.

[14616] VGAM244 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM244 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14617] VGAM244 gene encodes a VGAM244 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM244 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM244 precursor RNA is designated SEQ ID:230, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:230 is

located at position 84833 relative to the genome of Calitrichine Herpesvirus 3.

[14618] VGAM244 precursor RNA folds onto itself, forming VGAM244 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14619] An enzyme complex designated DICER COMPLEX, `dices` the VGAM244 folded precursor RNA into VGAM244 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM244 RNA is designated SEQ ID:2955, and is provided hereinbelow with reference to the sequence listing part.

[14620] VGAM244 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM244 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM244 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[14621] VGAM244 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM244 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM244 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM244 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM244 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[14622] The complementary binding of VGAM244 RNA, herein designated VGAM RNA, to host target binding sites on VGAM244 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM244 host target RNA into VGAM244 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14623] It is appreciated that VGAM244 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM244 host target genes. The mRNA of each one of this plurality of VGAM244 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM244 RNA, herein designated VGAM RNA, and which when bound by VGAM244 RNA causes inhibition of translation of respective one or more VGAM244

host target proteins.

[14624] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM244 gene, herein designated VGAM GENE, on one or more VGAM244 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[14625] It is yet further appreciated that a function of VGAM244 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM244 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3.

Specific functions, and accordingly utilities, of VGAM244 correlate with, and may be deduced from, the identity of the host target genes which VGAM244 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [14626] Nucleotide sequences of the VGAM244 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM244 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM244 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM244 are further described hereinbelow with reference to Table 1.
- [14627] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM244 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM244 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [14628] As mentioned hereinabove with reference to Fig. 1, a function of VGAM244 gene, herein designated VGAM is inhibition of expression of VGAM244 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM244 correlate with, and may be deduced from, the identity of the target genes which VGAM244 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14629] Sirtuin Silent Mating Type Information Regulation 2 Homolog 1 (*S. cerevisiae*) (SIRT1, Accession NM_012238) is a VGAM244 host target gene. SIRT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIRT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIRT1 BINDING SITE, designated SEQ ID:14541, to the nucleotide sequence of VGAM244 RNA, herein designated VGAM RNA, also designated SEQ ID:2955.

[14630] A function of VGAM244 is therefore inhibition of Sirtuin Silent Mating Type Information Regulation 2 Homolog 1 (*S. cerevisiae*) (SIRT1, Accession NM_012238), a gene which may function as intracellular regulatory protein with mono-ADP-ribosyltransferase activity. Accordingly, utilities of VGAM244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIRT1. The function of SIRT1 has been established by pre-

vious studies. Vaziri et al. (2001) showed that the SIRT1 protein binds and deacetylates the p53 protein (OMIM Ref. No. 191170) with a specificity for its C-terminal lys382 residue, modification of which is implicated in the activation of p53 as a transcription factor. Expression of wild-type SIRT1 in human cells reduced the transcriptional activity of p53. In contrast, expression of a catalytically inactive SIRT1 protein potentiated p53-dependent apoptosis and radiosensitivity. These results suggested that SIRT1 is involved in the regulation of p53 function via deacetylation. Luo et al. (2001) showed that mammalian SIRT1 physically interacts with p53 and attenuates p53-mediated functions. Nicotinamide (vitamin B3) inhibited an NAD-dependent p53 deacetylation induced by SIRT1 and also enhanced the p53 acetylation levels in vivo. Furthermore, SIRT1 repressed p53-dependent apoptosis in response to DNA damage and oxidative stress, whereas expression of a SIRT1 point mutant increased the sensitivity of cells in the stress response.

[14631] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14632] Vaziri, H.; Dessain, S. K.; Eaton, E. N.; Imai, S.-I.; Frye, R.

A.; Pandita, T. K.; Guarente, L.; Weinberg, R. A. :
hSIR2-SIRT1 functions as an NAD-dependent p53
deacetylase. Cell 107: 149-159, 2001. ; and

[14633] Luo, J.; Nikolaev, A. Y.; Imai, S.; Chen, D.; Su, F.; Shiloh, A.;

Sir2-alpha promotes cell survival under stress. Cell 107:
137-148, 2.

[14634] Further studies establishing the function and utilities of
SIRT1 are found in John Hopkins OMIM database record ID
604479, and in cited publications numbered 5008-5010,
504 and 5049-5052 listed in the bibliography section
hereinbelow, which are also hereby incorporated by refer-
ence. Zinc Finger Protein 10 (KOX 1) (ZNF10, Accession
NM_015394) is another VGAM244 host target gene.
ZNF10 BINDING SITE is HOST TARGET binding site found
in the 3' untranslated region of mRNA encoded by ZNF10,
corresponding to a HOST TARGET binding site such as
BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2
illustrates the complementarity of the nucleotide se-
quences of ZNF10 BINDING SITE, designated SEQ
ID:17692, to the nucleotide sequence of VGAM244 RNA,
herein designated VGAM RNA, also designated SEQ
ID:2955.

[14635] Another function of VGAM244 is therefore inhibition of Zinc Finger Protein 10 (KOX 1) (ZNF10, Accession NM_015394), a gene which may function as a transcriptional regulator. Accordingly, utilities of VGAM244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF10. The function of ZNF10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM36. Rho Guanine Nucleotide Exchange Factor (GEF) 11 (ARHGEF11, Accession NM_014784) is another VGAM244 host target gene. ARHGEF11 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ARHGEF11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF11 BINDING SITE, designated SEQ ID:16639, to the nucleotide sequence of VGAM244 RNA, herein designated VGAM RNA, also designated SEQ ID:2955.

[14636] Another function of VGAM244 is therefore inhibition of Rho Guanine Nucleotide Exchange Factor (GEF) 11 (ARHGEF11, Accession NM_014784). Accordingly, utilities

of VGAM244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF11. Low Density Lipoprotein-related Protein 1B (deleted in tumors) (LRP1B, Accession NM_018557) is another VGAM244 host target gene. LRP1B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LRP1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP1B BINDING SITE, designated SEQ ID:20637, to the nucleotide sequence of VGAM244 RNA, herein designated VGAM RNA, also designated SEQ ID:2955.

[14637] Another function of VGAM244 is therefore inhibition of Low Density Lipoprotein-related Protein 1B (deleted in tumors) (LRP1B, Accession NM_018557). Accordingly, utilities of VGAM244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP1B. Retinoic Acid Induced 15 (RAI15, Accession XM_039548) is another VGAM244 host target gene. RAI15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAI15, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI15 BINDING SITE, designated SEQ ID:33117, to the nucleotide sequence of VGAM244 RNA, herein designated VGAM RNA, also designated SEQ ID:2955.

[14638] Another function of VGAM244 is therefore inhibition of Retinoic Acid Induced 15 (RAI15, Accession XM_039548). Accordingly, utilities of VGAM244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI15. SDF1 (Accession XM_165565) is another VGAM244 host target gene. SDF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDF1 BINDING SITE, designated SEQ ID:43687, to the nucleotide sequence of VGAM244 RNA, herein designated VGAM RNA, also designated SEQ ID:2955.

[14639] Another function of VGAM244 is therefore inhibition of SDF1 (Accession XM_165565). Accordingly, utilities of VGAM244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDF1.

LOC149373 (Accession XM_086507) is another VGAM244 host target gene. LOC149373 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149373 BINDING SITE, designated SEQ ID:38717, to the nucleotide sequence of VGAM244 RNA, herein designated VGAM RNA, also designated SEQ ID:2955.

[14640] Another function of VGAM244 is therefore inhibition of LOC149373 (Accession XM_086507). Accordingly, utilities of VGAM244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149373. LOC257464 (Accession XM_116972) is another VGAM244 host target gene. LOC257464 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257464 BINDING SITE, designated SEQ ID:43160, to the nucleotide sequence of VGAM244 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2955.

[14641] Another function of VGAM244 is therefore inhibition of LOC257464 (Accession XM_116972). Accordingly, utilities of VGAM244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257464. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 245 (VGAM245) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14642] VGAM245 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM245 was detected is described hereinabove with reference to Figs. 1–8.

[14643] VGAM245 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM245 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14644] VGAM245 gene encodes a VGAM245 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM245 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM245 precursor RNA is designated SEQ ID:231, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:231 is located at position 42813 relative to the genome of Calitrichine Herpesvirus 3.

[14645] VGAM245 precursor RNA folds onto itself, forming VGAM245 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14646] An enzyme complex designated DICER COMPLEX, `dices` the VGAM245 folded precursor RNA into VGAM245 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM245 RNA is designated SEQ ID:2956, and is provided hereinbelow with reference to the sequence listing part.

[14647] VGAM245 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM245 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM245 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[14648] VGAM245 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM245 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM245 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM245 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM245 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[14649] The complementary binding of VGAM245 RNA, herein designated VGAM RNA, to host target binding sites on VGAM245 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM245 host target RNA into VGAM245 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14650] It is appreciated that VGAM245 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM245 host target genes. The mRNA of

each one of this plurality of VGAM245 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM245 RNA, herein designated VGAM RNA, and which when bound by VGAM245 RNA causes inhibition of translation of respective one or more VGAM245 host target proteins.

[14651] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM245 gene, herein designated VGAM GENE, on one or more VGAM245 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[14652] It is yet further appreciated that a function of VGAM245 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM245 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM245 correlate with, and may be deduced from, the identity of the host target genes which VGAM245 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14653] Nucleotide sequences of the VGAM245 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM245 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM245 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM245 are further described hereinbelow with reference to Table 1.

[14654] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM245 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM245 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[14655] As mentioned hereinabove with reference to Fig. 1, a function of VGAM245 gene, herein designated VGAM is inhibition of expression of VGAM245 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM245 correlate with, and may be deduced from, the identity of the target genes which VGAM245 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14656] ADP-ribosylation Factor 3 (ARF3, Accession NM_001659) is a VGAM245 host target gene. ARF3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARF3 BINDING SITE, designated SEQ ID:7377, to the nucleotide sequence of VGAM245 RNA, herein designated VGAM RNA, also designated SEQ ID:2956.

[14657] A function of VGAM245 is therefore inhibition of ADP-ribosylation Factor 3 (ARF3, Accession NM_001659). Accordingly, utilities of VGAM245 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with ARF3. FE65L2 (Accession NM_133175) is another VGAM245 host target gene. FE65L2 BINDING SITE1 and FE65L2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FE65L2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FE65L2 BINDING SITE1 and FE65L2 BINDING SITE2, designated SEQ ID:28396 and SEQ ID:28397 respectively, to the nucleotide sequence of VGAM245 RNA, herein designated VGAM RNA, also designated SEQ ID:2956.

[14658] Another function of VGAM245 is therefore inhibition of FE65L2 (Accession NM_133175), a gene which may modulate the internalization of beta-amyloid precursor protein. Accordingly, utilities of VGAM245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FE65L2. The function of FE65L2 has been established by previous studies. To identify genes similar to Fe65 (OMIM Ref. No. 602709), Duilio et al. (1998) screened a rat brain cDNA library and isolated a Fe65L2 cDNA encoding a deduced 504-amino acid polypeptide.

Like Fe65 and Fe65L1 (OMIM Ref. No. 602710), the rat Fe65L2 protein contains 2 phosphotyrosine-binding (PTB) domains and a WW domain. Northern blot analysis detected predominant expression of a 2-kb Fe65L2 mRNA in rat brain and testis. Using the rat cDNA fragment as probe, Tanahashi and Tabira (1999) cloned human Fe65L2 from a fetal brain cDNA library. Fe65L2 encodes a deduced 486-amino acid protein that shares 86% sequence identity with the rat protein. Using RT-PCR of human fetal brain mRNA, Tanahashi and Tabira (1999) also identified a variant, caused by the splicing of a 6-nucleotide mini-exon, that results results in a peptide lacking 2 amino acids in the first PTB domain. Northern blot analysis revealed expression of a 2.2-kb transcript expressed mainly in the brain and in all brain regions tested. A 2.9-kb transcript was found in other tissues, with strongest expression in pancreas. By radiation hybrid analysis, Tanahashi and Tabira (1999) mapped the FE65L2 gene to chromosome 5.

[14659] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14660] Duilio, A.; Faraonio, R.; Minopoli, G.; Zambrano, N.; Russo,

T. : Fe65L2: a new member of the Fe65 protein family interacting with the intracellular domain of the Alzheimer's beta-amyloid precursor protein. *Biochem. J.* 330: 513-519, 1998. ; and

[14661] Tanahashi, H.; Tabira, T. : Genome structure and chromosomal mapping of the gene for Fe65L2 interacting with Alzheimer's beta-amyloid precursor protein. *Biochem. Biophys. Res. Commun.* 25.

[14662] Further studies establishing the function and utilities of FE65L2 are found in John Hopkins OMIM database record ID 602711, and in cited publications numbered 1120-1122 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Spondyloepiphyseal Dysplasia, Late (SEDL, Accession NM_014563) is another VGAM245 host target gene. SEDL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEDL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEDL BINDING SITE, designated SEQ ID:15902, to the nucleotide sequence of VGAM245 RNA, herein designated VGAM RNA, also designated SEQ ID:2956.

[14663] Another function of VGAM245 is therefore inhibition of Spondyloepiphyseal Dysplasia, Late (SEDL, Accession NM_014563), a gene which may play role in vesicular transport from endoplasmic reticulum to golgi. Accordingly, utilities of VGAM245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEDL. The function of SEDL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Sel-1 Suppressor of Lin-12-like (C. elegans) (SEL1L, Accession NM_005065) is another VGAM245 host target gene. SEL1L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEL1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEL1L BINDING SITE, designated SEQ ID:11500, to the nucleotide sequence of VGAM245 RNA, herein designated VGAM RNA, also designated SEQ ID:2956.

[14664] Another function of VGAM245 is therefore inhibition of Sel-1 Suppressor of Lin-12-like (C. elegans) (SEL1L, Accession NM_005065), a gene which may play a role in

notch signaling (by similarity). Accordingly, utilities of VGAM245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEL1L. The function of SEL1L has been established by previous studies. Biunno et al. (1997) isolated a novel cDNA, designated SEL1L by them, that shows sequence similarities to sel-1, a gene identified as an extragenic suppressor of the lin-12 hypomorphic mutant from *C. elegans* (3,4:Grant and Greenwald, 1996, 1997). SEL1L exhibited a tissue-specific pattern of expression: high levels of a single 7.5-kb transcript were detected only in the pancreas of healthy individuals, whereas low to undetectable levels were observed in other adult tissues and in some fetal tissues. Because of the tissue-specific expression of the gene, Biunno et al. (1997) studied the gene in human pancreatic carcinomas. They found that 17% of adenocarcinomas of the pancreas did not express SEL1L to a detectable level; however, no gross genomic alterations were apparent within a few hundred kb of the relevant region. By somatic cell hybrid analysis and fluorescence in situ hybridization, Biunno et al. (1997) mapped the SEL1L gene to chromosome 14q31. Donoviel and Bernstein (1999) localized the gene to 14q24.3-q31 by FISH and radiation

hybrid analysis.

[14665] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14666] Biunno, I.; Appierto, V.; Cattaneo, M.; Leone, B. E.; Balzano, G.; Socci, C.; Saccone, S.; Letizia, A.; Valle, G. D.; Sgaramella, V. : Isolation of a pancreas-specific gene located on human chromosome 14q31: expression analysis in human pancreatic ductal carcinomas. *Genomics* 46: 284–286, 1997. ; and

[14667] Donoviel, D. B.; Bernstein, A. : SEL-1L maps to human chromosome 14, near the insulin-dependent diabetes mellitus locus 11. *Genomics* 56: 232–233, 1999.

[14668] Further studies establishing the function and utilities of SEL1L are found in John Hopkins OMIM database record ID 602329, and in cited publications numbered 6003–6006 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ10853 (Accession NM_018246) is another VGAM245 host target gene. FLJ10853 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10853, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10853 BINDING SITE, designated SEQ ID:20209, to the nucleotide sequence of VGAM245 RNA, herein designated VGAM RNA, also designated SEQ ID:2956.

[14669] Another function of VGAM245 is therefore inhibition of FLJ10853 (Accession NM_018246). Accordingly, utilities of VGAM245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10853. FLJ20511 (Accession NM_017853) is another VGAM245 host target gene. FLJ20511 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20511 BINDING SITE, designated SEQ ID:19526, to the nucleotide sequence of VGAM245 RNA, herein designated VGAM RNA, also designated SEQ ID:2956.

[14670] Another function of VGAM245 is therefore inhibition of FLJ20511 (Accession NM_017853). Accordingly, utilities of VGAM245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20511.

KIAA1026 (Accession XM_048825) is another VGAM245 host target gene. KIAA1026 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1026 BINDING SITE, designated SEQ ID:35276, to the nucleotide sequence of VGAM245 RNA, herein designated VGAM RNA, also designated SEQ ID:2956.

[14671] Another function of VGAM245 is therefore inhibition of KIAA1026 (Accession XM_048825). Accordingly, utilities of VGAM245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1026. KIAA1198 (Accession XM_032674) is another VGAM245 host target gene. KIAA1198 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1198, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1198 BINDING SITE, designated SEQ ID:31701, to the nucleotide sequence of VGAM245 RNA, herein designated

VGAM RNA, also designated SEQ ID:2956.

[14672] Another function of VGAM245 is therefore inhibition of KIAA1198 (Accession XM_032674). Accordingly, utilities of VGAM245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1198. KIAA1536 (Accession NM_020898) is another VGAM245 host target gene. KIAA1536 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1536, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1536 BINDING SITE, designated SEQ ID:21921, to the nucleotide sequence of VGAM245 RNA, herein designated VGAM RNA, also designated SEQ ID:2956.

[14673] Another function of VGAM245 is therefore inhibition of KIAA1536 (Accession NM_020898). Accordingly, utilities of VGAM245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1536. KIAA1615 (Accession XM_044021) is another VGAM245 host target gene. KIAA1615 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1615, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1615 BINDING SITE, designated SEQ ID:34080, to the nucleotide sequence of VGAM245 RNA, herein designated VGAM RNA, also designated SEQ ID:2956.

[14674] Another function of VGAM245 is therefore inhibition of KIAA1615 (Accession XM_044021). Accordingly, utilities of VGAM245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1615. LOC146227 (Accession XM_085374) is another VGAM245 host target gene. LOC146227 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146227, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146227 BINDING SITE, designated SEQ ID:38080, to the nucleotide sequence of VGAM245 RNA, herein designated VGAM RNA, also designated SEQ ID:2956.

[14675] Another function of VGAM245 is therefore inhibition of LOC146227 (Accession XM_085374). Accordingly, utilities of VGAM245 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC146227. LOC148137 (Accession NM_144692) is another VGAM245 host target gene. LOC148137 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148137, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148137 BINDING SITE, designated SEQ ID:29517, to the nucleotide sequence of VGAM245 RNA, herein designated VGAM RNA, also designated SEQ ID:2956.

[14676] Another function of VGAM245 is therefore inhibition of LOC148137 (Accession NM_144692). Accordingly, utilities of VGAM245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148137. LOC92876 (Accession XM_047739) is another VGAM245 host target gene. LOC92876 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92876, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92876 BINDING SITE, designated SEQ ID:35039, to the

nucleotide sequence of VGAM245 RNA, herein designated VGAM RNA, also designated SEQ ID:2956.

[14677] Another function of VGAM245 is therefore inhibition of LOC92876 (Accession XM_047739). Accordingly, utilities of VGAM245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92876. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 246 (VGAM246) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14678] VGAM246 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM246 was detected is described hereinabove with reference to Figs. 1–8.

[14679] VGAM246 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM246 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14680] VGAM246 gene encodes a VGAM246 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM246 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM246 precursor RNA is designated SEQ ID:232, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:232 is located at position 84351 relative to the genome of Calitrichine Herpesvirus 3.

[14681] VGAM246 precursor RNA folds onto itself, forming VGAM246 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14682] An enzyme complex designated DICER COMPLEX, `dices` the VGAM246 folded precursor RNA into VGAM246 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM246 RNA is designated SEQ ID:2957, and is provided hereinbelow with reference to the sequence listing part.

[14683] VGAM246 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM246 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM246 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[14684] VGAM246 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM246 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM246 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM246 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM246 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[14685] The complementary binding of VGAM246 RNA, herein designated VGAM RNA, to host target binding sites on VGAM246 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM246 host target RNA into VGAM246 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14686] It is appreciated that VGAM246 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM246 host target genes. The mRNA of each one of this plurality of VGAM246 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM246 RNA, herein designated VGAM RNA, and which when bound by VGAM246 RNA causes inhibition of translation of respective one or more VGAM246 host target proteins.

[14687] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM246 gene, herein designated VGAM GENE, on one or more VGAM246 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[14688] It is yet further appreciated that a function of VGAM246 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM246 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM246 correlate with, and may be deduced from, the identity of the host target genes which VGAM246 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14689] Nucleotide sequences of the VGAM246 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM246 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM246 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM246 are further described hereinbelow with reference to Table 1.

[14690] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM246 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM246 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14691] As mentioned hereinabove with reference to Fig. 1, a function of VGAM246 gene, herein designated VGAM is inhibition of expression of VGAM246 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM246 correlate with, and may be deduced from, the identity of the target genes which VGAM246 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14692] Activin A Receptor Type II-like 1 (ACVRL1, Accession NM_000020) is a VGAM246 host target gene. ACVRL1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ACVRL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACVRL1 BINDING SITE, designated SEQ ID:5453, to the nucleotide sequence of VGAM246 RNA, herein designated VGAM RNA, also designated SEQ ID:2957.

[14693] A function of VGAM246 is therefore inhibition of Activin A Receptor Type II-like 1 (ACVRL1, Accession NM_000020),

a gene which form an heteromeric complex after binding tgf-beta at the cell surface and act as signal transducers. Accordingly, utilities of VGAM246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACVRL1. The function of ACVRL1 has been established by previous studies. Activin A receptor, type II-like kinase 1 (also called activin receptor-like kinase 1) is a type I cell-surface receptor for the TGF-beta super-family of ligands (see OMIM Ref. No. TGF-beta, 190180). It shares with other type I receptors a high degree of similarity in serine-threonine kinase subdomains, a glycine- and serine-rich region (called the GS domain) preceding the kinase domain, and a short C-terminal tail (ten Dijke et al., 1994). The protein (symbolized ALK1 by Johnson et al., 1996) can associate with the TGF-beta or activin type II receptors (OMIM Ref. No. 102581) after cotransfection in COS cells, with the complex binding TGF-beta or activin (see OMIM Ref. No. 147290), respectively. However, the ALK1 ligand in vivo is unknown. Using a polyclonal antibody to ALK1, Abdalla et al. (2000) measured ALK1 expression on human umbilical vein endothelial cells (HUVEC) of newborns from HHT2 families. Animal model experiments lend further support to the function of

ACVRL1. Urness et al. (2000) focused on HHT, wherein arterial and venous beds fail to remain distinct. They generated mice lacking *Acvrl1*, the substance missing in one form of HHT.

[14694] It is appreciated that the abovementioned animal model for ACVRL1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[14695] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14696] Johnson, D. W.; Berg, J. N.; Baldwin, M. A.; Gallione, C. J.; Marondel, I.; Yoon, S.-J.; Stenzel, T. T.; Speer, M.; Pericak-Vance, M. A.; Diamond, A.; Guttmacher, A. E.; Jackson, C. E.; Attisano, L.; Kucherlapati, R.; Porteous, M. E. M.; Marchuk, D. A. : Mutations in the activin receptor-like kinase 1 gene in hereditary haemorrhagic telangiectasia type 2. *Nature Genet.* 13: 189–195, 1996. ; and

[14697] Urness, L. D.; Sorensen, L. K.; Li, D. Y. : Arteriovenous malformations in mice lacking activin receptor-like kinase-1. *Nature Genet.* 26: 328–331, 2000.

[14698] Further studies establishing the function and utilities of ACVRL1 are found in John Hopkins OMIM database record

ID 601284, and in cited publications numbered 11919–1334, 10177, 4270, 427 and 6378 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. E2F Transcription Factor 2 (E2F2, Accession NM_004091) is another VGAM246 host target gene. E2F2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by E2F2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of E2F2 BINDING SITE, designated SEQ ID:10293, to the nucleotide sequence of VGAM246 RNA, herein designated VGAM RNA, also designated SEQ ID:2957.

[14699] Another function of VGAM246 is therefore inhibition of E2F Transcription Factor 2 (E2F2, Accession NM_004091), a gene which binds dna cooperatively with dp proteins and involves in cell cycle regulation. Accordingly, utilities of VGAM246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with E2F2. The function of E2F2 has been established by previous studies. MYC (OMIM Ref. No. 190080) induces transcription of the E2F1, E2F2, and E2F3 (OMIM Ref. No. 600427)

genes. Using primary mouse embryo fibroblasts deleted for individual E2f genes, Leone et al. (2001) showed that MYC-induced S phase and apoptosis requires distinct E2F activities. The ability of Myc to induce S phase was impaired in the absence of either E2f2 or E2f3 but not E2f1 or E2f4 (OMIM Ref. No. 600659). In contrast, the ability of Myc to induce apoptosis was markedly reduced in cells deleted for E2f1 but not E2f2 or E2f3. The authors proposed that the induction of specific E2F activities is an essential component in the MYC pathways that control cell proliferation and cell fate decisions. The retinoblastoma tumor suppressor (Rb) pathway is believed to have a critical role in the control of cellular proliferation by regulating E2F activities. E2F1, E2F2, and E2F3 belong to a subclass of E2F factors thought to act as transcriptional activators important for progression through the G1/S transition. Wu et al. (2001) used a conditional gene targeting approach to demonstrate that combined loss of these 3 E2F factors severely affects E2F target expression and completely abolishes the ability of mouse embryonic fibroblasts to enter S phase, progress through mitosis, and proliferate. Loss of E2F function results in elevation of CIP1 (OMIM Ref. No. 116899) protein, leading to a de-

crease in cyclin-dependent kinase activity and Rb phosphorylation. Wu et al. (2001) concluded that these findings suggest a function for this subclass of E2F transcriptional activators in a positive feedback loop, through downmodulation of CIP1, that leads to the inactivation of Rb-dependent repression and S phase entry. By targeting the entire subclass of E2F transcriptional activators, Wu et al. (2001) provided direct genetic evidence for their essential role in cell cycle progression, proliferation, and development. Wu et al. (2001) initially generated and interbred E2f1, E2f2, and E2f3 mutant mice, and found that although mice null for E2f1 and E2f2 were viable and developed to adulthood, mice null for E2f1 and E2f3 or E2f2 and E2f3 died early during embryonic development, at or just before embryonic day 9.5, pointing to a central role for E2F3 in mouse development.

[14700] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14701] Leone, G.; Sears, R.; Huang, E.; Rempel, R.; Nuckolls, F.; Park, C.-H.; Giangrande, P.; Wu, L.; Saavedra, H. I.; Field, S. J.; Thompson, M. A.; Yang, H.; Fujiwara, Y.; Greenberg, M. E.; Orkin, S.; Smith, C.; Nevins, J. R. : Myc requires dis-

tinct E2F activities to induce S phase and apoptosis.

Molec. Cell 8: 105–113, 2001. ; and

[14702] Wu, L.; Timmers, C.; Maiti, B.; Saavedra, H. I.; Sang, L.; Chong, G. T.; Nuckolls, F.; Giangrande, P.; Wright, F. A.; Field, S. J.; Greenberg, M. E.; Orkin, S.; Nevins, J. R.; Robinson.

[14703] Further studies establishing the function and utilities of E2F2 are found in John Hopkins OMIM database record ID 600426, and in cited publications numbered 7561–756 and 9711 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Platelet-derived Growth Factor Receptor, Alpha Polypeptide (PDGFRA, Accession NM_006206) is another VGAM246 host target gene. PDGFRA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDGFRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDGFRA BINDING SITE, designated SEQ ID:12882, to the nucleotide sequence of VGAM246 RNA, herein designated VGAM RNA, also designated SEQ ID:2957.

[14704] Another function of VGAM246 is therefore inhibition of

Platelet-derived Growth Factor Receptor, Alpha Polypeptide (PDGFRA, Accession NM_006206), a gene which this receptor binds platelet-derived growth factor and has a tyrosine-protein kinase activity. Accordingly, utilities of VGAM246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDGFRA. The function of PDGFRA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM117. Phospholipase A2, Group IID (PLA2G2D, Accession NM_012400) is another VGAM246 host target gene. PLA2G2D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLA2G2D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLA2G2D BINDING SITE, designated SEQ ID:14773, to the nucleotide sequence of VGAM246 RNA, herein designated VGAM RNA, also designated SEQ ID:2957.

[14705] Another function of VGAM246 is therefore inhibition of Phospholipase A2, Group IID (PLA2G2D, Accession NM_012400), a gene which is involved in phospholipid di-

gestion, remodeling of cell membranes, and host defense, as well as pathophysiologic processes. Accordingly, utilities of VGAM246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLA2G2D. The function of PLA2G2D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Complexin 1 (CPLX1, Accession NM_006651) is another VGAM246 host target gene. CPLX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CPLX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPLX1 BINDING SITE, designated SEQ ID:13451, to the nucleotide sequence of VGAM246 RNA, herein designated VGAM RNA, also designated SEQ ID:2957.

[14706] Another function of VGAM246 is therefore inhibition of Complexin 1 (CPLX1, Accession NM_006651). Accordingly, utilities of VGAM246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPLX1. DKFZP566K1924 (Accession XM_057469) is another VGAM246 host target gene. DKFZP566K1924

BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP566K1924, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566K1924 BINDING SITE, designated SEQ ID:36519, to the nucleotide sequence of VGAM246 RNA, herein designated VGAM RNA, also designated SEQ ID:2957.

[14707] Another function of VGAM246 is therefore inhibition of DKFZP566K1924 (Accession XM_057469). Accordingly, utilities of VGAM246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566K1924. PAX Transcription Activation Domain Interacting Protein 1 Like (PAXIP1L, Accession XM_046538) is another VGAM246 host target gene. PAXIP1L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PAXIP1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAXIP1L BINDING SITE, designated SEQ ID:34739, to the nucleotide sequence of VGAM246 RNA,

herein designated VGAM RNA, also designated SEQ ID:2957.

[14708] Another function of VGAM246 is therefore inhibition of PAX Transcription Activation Domain Interacting Protein 1 Like (PAXIP1L, Accession XM_046538). Accordingly, utilities of VGAM246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAXIP1L. LOC147791 (Accession XM_097293) is another VGAM246 host target gene. LOC147791 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147791, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147791 BINDING SITE, designated SEQ ID:40858, to the nucleotide sequence of VGAM246 RNA, herein designated VGAM RNA, also designated SEQ ID:2957.

[14709] Another function of VGAM246 is therefore inhibition of LOC147791 (Accession XM_097293). Accordingly, utilities of VGAM246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147791. LOC149296 (Accession XM_086481) is another VGAM246 host target gene. LOC149296 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149296, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149296 BINDING SITE, designated SEQ ID:38695, to the nucleotide sequence of VGAM246 RNA, herein designated VGAM RNA, also designated SEQ ID:2957.

[14710] Another function of VGAM246 is therefore inhibition of LOC149296 (Accession XM_086481). Accordingly, utilities of VGAM246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149296. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 247 (VGAM247) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14711] VGAM247 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM247 was detected is described hereinabove with reference to Figs. 1-8.

[14712] VGAM247 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM247 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14713] VGAM247 gene encodes a VGAM247 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM247 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM247 precursor RNA is designated SEQ ID:233, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:233 is located at position 25823 relative to the genome of Callitrichine Herpesvirus 3.

[14714] VGAM247 precursor RNA folds onto itself, forming VGAM247 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[14715] An enzyme complex designated DICER COMPLEX, `dices` the VGAM247 folded precursor RNA into VGAM247 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM247 RNA is designated SEQ ID:2958, and is provided hereinbelow with reference to the sequence listing part.

[14716] VGAM247 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM247 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM247 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[14717] VGAM247 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM247 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM247 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM247 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM247 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[14718] The complementary binding of VGAM247 RNA, herein designated VGAM RNA, to host target binding sites on VGAM247 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM247 host target RNA into VGAM247 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14719] It is appreciated that VGAM247 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM247 host target genes. The mRNA of each one of this plurality of VGAM247 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM247 RNA, herein designated VGAM RNA, and which when bound by VGAM247 RNA causes inhibition of translation of respective one or more VGAM247 host target proteins.

[14720] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM247 gene, herein designated VGAM GENE, on one or more VGAM247 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[14721] It is yet further appreciated that a function of VGAM247 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM247 correlate with, and may be deduced from, the identity of the host target genes which VGAM247 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14722] Nucleotide sequences of the VGAM247 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM247 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM247 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM247 are further described hereinbelow with reference to Table 1.

[14723] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM247 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM247 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14724] As mentioned hereinabove with reference to Fig. 1, a function of VGAM247 gene, herein designated VGAM is inhibition of expression of VGAM247 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM247 correlate with, and may be deduced from, the identity of the target genes which VGAM247 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14725] Amyloid Beta (A4) Precursor Protein-binding, Family A, Member 1 (X11) (APBA1, Accession XM_046018) is a VGAM247 host target gene. APBA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APBA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APBA1 BINDING SITE, designated SEQ ID:34647, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14726] A function of VGAM247 is therefore inhibition of Amyloid Beta (A4) Precursor Protein-binding, Family A, Member 1 (X11) (APBA1, Accession XM_046018), a gene which stabilises APP and inhibits production of proteolytic APP fragments. Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APBA1. The function of APBA1 has been established by previous studies. Abnormal processing of the membrane-spanning amyloid precursor protein (APP; 104760), resulting in the production of increased amounts of fibrillogenic beta-amyloid peptide (OMIM Ref. No. A-beta), is considered to be one of the key metabolic events underlying Alzheimer disease (OMIM Ref. No. 104300). One pathway for A-beta production involves the reinternalization of membrane-bound APP into lysosomes where APP containing intact A-beta are generated. In common with a number of cell surface receptors, the C-terminal cytoplasmic domain of APP contains an asn-

pro-thr-tyr (NPTY) motif that mediates re-internalization via clathrin-coated pits (Chen et al., 1990). This motif has also been demonstrated to be a consensus sequence for binding to phosphotyrosine-binding/-interacting domain (PTB)-bearing proteins (van der Geer and Pawson, 1995). Several groups demonstrated that the cytoplasmic domain of APP binds to 4 human PTB proteins: X11, X11-like (APBA2; 602712), Fe65 (APBB1; 602709), and Fe65-like (APBB2; 602710). PTB-domain proteins are believed to be involved in signal transduction processes, and the interaction of APP with the 4 human PTB proteins suggest a role for APP in such signal transduction mechanisms. Furthermore, as the 4 proteins interact with the YENPTY motif in APP, these PTB proteins may modulate processing of APP and hence formation of A-beta. Blanco et al. (1998) pointed out that it is generally agreed that there are as yet unidentified susceptibility genes for Alzheimer disease. The genes APBA1, APBA2, APBB1, and APBB2 represent such candidate genes. By searching for proteins that bind to Munc18-1 (OMIM Ref. No. 602926), Okamoto and Sudhof (1997) isolated rat cDNAs encoding Mint1 and Mint2. They determined the full-length human MINT1 cDNA sequence (GenBank AF029106) using human MINT1 ESTs.

The deduced 837–amino acid MINT1 protein contains an N–terminal domain that binds to Munc18–1, a middle phosphotyrosine–binding (PTB) domain that binds to phosphatidylinositol phosphates, and 2 C–terminal PDZ domains. The rat Mint1 protein is largely membrane–bound and copurifies with synaptic plasma membranes, but it is not a component of synaptic vesicles. The authors suggested that in the brain Mint1 is part of a multimeric complex containing Munc18–1 and syntaxin–1 (OMIM Ref. No. 186590) that likely functions as an intermediate in synaptic vesicle docking/fusion.

[14727] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14728] Blanco, G.; Irving, N. G.; Brown, S. D. M.; Miller, C. C. J.; McLoughlin, D. M. : Mapping of the human and murine X11–like genes (APBA2 and Apba2), the murine Fe65 gene (Apbb1), and the human Fe65–like gene (APBB2): genes encoding phosphotyrosine–binding domain proteins that interact with the Alzheimer's disease amyloid precursor protein. *Mammalian Genome* 9: 473–475, 1998. ; and

[14729] Okamoto, M.; Sudhof, T. C. : Mints, Munc18–interacting proteins in synaptic vesicle exocytosis. *J. Biol. Chem.* 272:

31459–31464, 1997.

[14730] Further studies establishing the function and utilities of APBA1 are found in John Hopkins OMIM database record ID 602414, and in cited publications numbered 1019–1023, 9589, 102 and 1455 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Bone Morphogenetic Protein 1 (BMP1, Accession NM_006132) is another VGAM247 host target gene. BMP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BMP1 BINDING SITE, designated SEQ ID:12773, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14731] Another function of VGAM247 is therefore inhibition of Bone Morphogenetic Protein 1 (BMP1, Accession NM_006132), a gene which cleaves procollagens leading to formation of extracellular matrix. Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMP1. The function of BMP1 has been established by previous

studies. The BMP1 locus encodes a protein that is capable of inducing formation of cartilage in vivo (Wozney et al., 1988). Although other bone morphogenetic proteins are members of the TGF-beta (OMIM Ref. No. 190180) superfamily, BMP1 encodes a novel protein that is not closely related to other known growth factors. Kessler et al. (1996) showed that recombinantly expressed BMP1 and purified procollagen C proteinase (PCP), a secreted metalloprotease requiring calcium and needed for cartilage and bone formation, are, in fact, identical. PCP cleaves the C-terminal propeptides of procollagen I (OMIM Ref. No. 120150), II (OMIM Ref. No. 120140), and III (OMIM Ref. No. 120180) and its activity is increased by the procollagen C-endopeptidase enhancer protein (OMIM Ref. No. 600270). Reddi (1996) discussed the significance of the finding that BMP1 is the same as procollagen C-proteinase.

[14732] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14733] Wozney, J. M.; Rosen, V.; Celeste, A. J.; Mitsock, L. M.; Whitters, M. J.; Kriz, R. W.; Hewick, R. M.; Wang, E. A. : Novel regulators of bone formation: molecular clones and

activities. Science 242: 1528–1534, 1988. ; and

[14734] Kessler, E.; Takahara, K.; Biniaminov, L.; Brusel, M.; Greenspan, D. : Bone morphogenic protein–1: the type I procollagen C–proteinase. Science 271: 360–362, 1996.

[14735] Further studies establishing the function and utilities of BMP1 are found in John Hopkins OMIM database record ID 112264, and in cited publications numbered 11640–11643, 1909, 1912, 11629–191 and 11630 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Calpain 10 (CAPN10, Accession NM_023088) is another VGAM247 host target gene. CAPN10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN10 BINDING SITE, designated SEQ ID:23354, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14736] Another function of VGAM247 is therefore inhibition of Calpain 10 (CAPN10, Accession NM_023088), a gene which catalyzes limited proteolysis of substrates involved

in cytoskeletal remodelling and signal transduction. Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN10. The function of CAPN10 has been established by previous studies. The results of Horikawa et al. (2000) suggested a novel pathway involved in the pathophysiology of diabetes, one that may include, in addition to calpain-10, its substrates, inhibitors, and activators. Calpain-10 may represent the third example of a protease contributing to the development of diabetes, the others being prohormone-processing carboxypeptidase E (OMIM Ref. No. 114855) and prohormone convertase-1 (OMIM Ref. No. 162150), both of which are associated with diabetes and obesity. Horikawa et al. (2000) found a single-nucleotide polymorphism (SNP) associated with noninsulin-dependent diabetes mellitus (OMIM Ref. No. 125853). The G/A variation involved nucleotide 4852 of the genomic sequence of the CAPN10 gene and was located in intron 3, 746 bp downstream of the splice donor site and 176 bp upstream of the splice acceptor site. This and 2 other polymorphisms in the CAPN10 gene refined a haplotype that was associated with greatest risk of diabetes in Mexican-Americans, as well as in Finnish and

German populations.

[14737] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14738] Horikawa, Y.; Oda, N.; Cox, N. J.; Li, X.; Orho-Melander, M.; Hara, M.; Hinokio, Y.; Lindner, T. H.; Mashima, H.; Schwarz, P. E. H.; del Bosque-Plata, L.; Horikawa, Y.; and 14 others : Genetic variation in the gene encoding calpain-10 is associated with type 2 diabetes mellitus. *Nature Genet.* 26: 163–175, 2000. ; and

[14739] Hanis, C. L.; Boerwinkle, E.; Chakraborty, R.; Ellsworth, D. L.; Concannon, P.; Stirling, B.; Morrison, V. A.; Wapelhorst, B.; Spielman, R. S.; Gogolin-Ewens, K. J.; Shephard, J. M.; Wi.

[14740] Further studies establishing the function and utilities of CAPN10 are found in John Hopkins OMIM database record ID 605286, and in cited publications numbered 1330–1331, 6979–6981, 698 and 6982–6983 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cyclin-dependent Kinase Inhibitor 2B (p15, inhibits CDK4) (CDKN2B, Accession NM_078487) is another VGAM247 host target gene. CDKN2B BINDING SITE is HOST TARGET binding site found

in the 5` untranslated region of mRNA encoded by CDKN2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDKN2B BINDING SITE, designated SEQ ID:27809, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14741] Another function of VGAM247 is therefore inhibition of Cyclin-dependent Kinase Inhibitor 2B (p15, inhibits CDK4) (CDKN2B, Accession NM_078487). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDKN2B. Cyclin-dependent Kinase Inhibitor 2D (p19, inhibits CDK4) (CDKN2D, Accession NM_001800) is another VGAM247 host target gene. CDKN2D BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CDKN2D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDKN2D BINDING SITE, designated SEQ ID:7554, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2958.

[14742] Another function of VGAM247 is therefore inhibition of Cyclin-dependent Kinase Inhibitor 2D (p19, inhibits CDK4) (CDKN2D, Accession NM_001800), a gene which interacts strongly with cdk4 and cdk6. Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDKN2D. The function of CDKN2D has been established by previous studies. Cyclins are important in regulating the cell cycle through their formation of enzymatic complexes with various cyclin-dependent kinases. The D type cyclins complex with CDK4 (OMIM Ref. No. 123829) and CDK6 to govern progression through the G1 phase of the cell cycle and later are involved with inactivating phosphorylation of the RB protein (OMIM Ref. No. 180200) which results in release of RB-associated transcription factors that are needed for entry into S phase (Okuda et al., 1995). The activity of the cyclin D-dependent kinases is, in part, controlled by inhibitors such as the INK4 family (which includes INK4a (CDKN2A; 600160), 4b (CDKN2B; 600431), 4c (OMIM Ref. No. CDKN2C), and 4d (OMIM Ref. No. CDKN2D)). INK4a has been shown to act by competing with CDK4 and CDK6 and functions as a tumor suppressor

in a variety of cancers. The INK4d protein was first identified in a yeast 2-hybrid system screened for CDK4 binding proteins (Hirai et al., 1995). The mouse INK4d protein interacts with cdk6 as well. In fibroblasts and macrophages it is rapidly induced at the G1-to-S transition. Overexpression of INK4d caused NIH 3T3 cells to arrest in G1 phase and inhibited cyclin D1-CDK4 kinase activity (Hirai et al., 1995). Okuda et al. (1995) described the cloning and mapping of the human INK4d gene (OMIM Ref. No. CDKN2D). The predicted 166-amino acid protein is 86% identical to the mouse protein and about 45% identical to other human INK4 family members. Northern blots showed that the 1.4-kb transcript is ubiquitously expressed with the highest levels in tissues with the most rapidly dividing cells. Lowest expression occurs at mid G1 phase and is highest during S phase. Okuda et al. (1995) obtained a P1-phage genomic clone including the gene and mapped it by fluorescence in situ hybridization to 19p13

[14743] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14744] Hirai, H.; Roussel, M. F.; Kato, J.-Y.; Ashmun, R. A.; Sherr,

C. J. : Novel INK4 proteins, p19 and p18, are specific inhibitors of cyclin D-dependent kinases CDK4 and CDK6. Molec. Cell. Biol. 15: 2672–2681, 1995. ; and

[14745] Okuda, T.; Hirai, H.; Valentine, V. A.; Shurtleff, S. A.; Kidd, V. J.; Lahti, J. M.; Sherr, C. J.; Downing, J. R. : Molecular cloning, expression pattern, and chromosomal localization o.

[14746] Further studies establishing the function and utilities of CDKN2D are found in John Hopkins OMIM database record ID 600927, and in cited publications numbered 6859–6860 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM247 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:44330, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14747] Another function of VGAM247 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 has been established by previous studies. By sequencing randomly selected cDNAs corresponding to relatively long transcripts from brain, Nagase et al. (1997) identified a cDNA which they designated KIAA0381. The KIAA0381 cDNA encodes an 864-amino acid protein predicted to be involved in cell division. RT-PCR analysis detected expression of KIAA0381 in most tissues tested. Wnt (see OMIM Ref. No. 164975) signaling via the frizzled receptor (Fz; OMIM Ref. No. 600667) controls cell polarity and movement during development. Habas et al. (2001) reported that in human cells and during *Xenopus* embryogenesis, Wnt/Fz signaling activates the small GTPase Rho (OMIM Ref. No. 165390), a key regulator of cytoskeleton architecture. Wnt/Fz activation of Rho requires the cytoplasmic protein dishevelled (DVL; OMIM Ref. No. 601365) and a novel formin (see OMIM Ref. No. 136535) homology (FH)

protein that they identified and named DAAM1 (OMIM Ref. No. 606626). Habas et al. (2001) identified DAAM2, which is identical to KIAA0381, as a protein that is closely related to DAAM1.

[14748] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14749] Habas, R.; Kato, Y.; He, X. : Wnt/Frizzled activation of Rho regulates vertebrate gastrulation and requires a novel Formin homology protein Daam1. Cell 107: 843–854, 2001. ; and

[14750] Nagase, T.; Ishikawa, K.; Nakajima, D.; Ohira, M.; Seki, N.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human gene.

[14751] Further studies establishing the function and utilities of DAAM2 are found in John Hopkins OMIM database record ID 606627, and in cited publications numbered 4522 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM_013231) is another VGAM247 host target gene. FLRT2 BINDING SITE is HOST TARGET binding site found in the

3' untranslated region of mRNA encoded by FLRT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLRT2 BINDING SITE, designated SEQ ID:14882, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14752] Another function of VGAM247 is therefore inhibition of Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM_013231), a gene which may have a function in cell adhesion and/or receptor signaling. Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLRT2. The function of FLRT2 has been established by previous studies. The FLRT family of proteins structurally resembles small leucine-rich proteoglycans found in the extracellular matrix. By screening human brain cDNAs for the potential to encode proteins that are at least 50 kD, Ishikawa et al. (1997) isolated a FLRT2 cDNA, which they called KIAA0405. The deduced 660-amino acid full-length FLRT2 protein shares 25% amino acid sequence identity with the precursor of the alpha chain of human platelet glycoprotein Ib (GP1BA; OMIM Ref. No.

231200) across 180 residues. By SDS-PAGE, in vitro transcribed/translated FLRT2 had an apparent molecular mass of approximately 75 kD. RT-PCR detected FLRT2 expression in a number of human tissues, with highest expression in ovary and relatively high expression in brain and pancreas. By searching a human EST database with portions of the FLRT1 protein (OMIM Ref. No. 604806) sequence, Lacy et al. (1999) identified ESTs encoding FLRT2. The full-length FLRT2 coding sequence encodes a predicted 660-amino acid protein containing a putative N-terminal signal sequence, 10 leucine-rich repeats (LRRs) flanked by N- and C-terminal cysteine-rich regions, a fibronectin-/collagen-like domain, a transmembrane domain, and an intracellular C-terminal tail. FLRT2 has 5 potential N-glycosylation sites in its extracellular region. FLRT2 shares 44% amino acid sequence identity with FLRT3 (OMIM Ref. No. 604808) and 41% identity with FLRT1. Recombinant FLRT2 expressed in SF9 insect cells and monkey COS-1 cells migrated as an 85-kD protein on SDS-polyacrylamide gels. The authors demonstrated that FLRT2 is glycosylated. Northern blot analysis of a variety of human adult tissues detected a 7.5-kb FLRT2 transcript that was expressed abundantly in pancreas and less

abundantly in skeletal muscle, brain, and heart. Lacy et al. (1999) suggested that FLRT2 functions in cell adhesion and/or receptor signaling. By analysis of a radiation hybrid mapping panel, Ishikawa et al. (1997) mapped the FLRT2 gene to chromosome 14. Lacy et al. (1999) noted that a UniGene cluster corresponding to the FLRT2 gene has been mapped to 14q24–q32.

[14753] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14754] Ishikawa, K.; Nagase, T.; Nakajima, D.; Seki, N.; Ohira, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. VIII. 78 new cDNA clones from brain which code for large proteins in vitro. DNA Res. 4: 307–313, 1997. ; and

[14756] Further studies establishing the function and utilities of FLRT2 are found in John Hopkins OMIM database record ID 604807, and in cited publications numbered 110 and

4385 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glypican 6 (GPC6, Accession NM_005708) is another VGAM247 host target gene. GPC6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GPC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPC6 BINDING SITE, designated SEQ ID:12261, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14757] Another function of VGAM247 is therefore inhibition of Glypican 6 (GPC6, Accession NM_005708), a gene which may play a role in growth control and differentiation. Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPC6. The function of GPC6 has been established by previous studies. By searching an EST database for glypican-related cDNA sequences and using 5-prime RACE on a human fetal brain cDNA library, Veugelers et al. (1999) identified a novel glypican, which they designated glypican-6. The GPC6 gene, which contains 9 exons, en-

codes a 555-amino acid protein with a molecular mass of approximately 65 kD. The GPC6 protein is 63% identical to GPC4 (OMIM Ref. No. 300168). Like all glypicans, GPC6 starts and terminates with signal peptide-like sequences. The N-terminal sequence is predicted to be required for membrane translocation, and the C-terminal sequence supports the temporary membrane anchoring and subsequent glypiation of the protein. A motif that promotes the assembly of heparan sulfate in proteoglycans is also found at the C-terminal end. Northern blot analysis revealed ubiquitous expression of GPC6 in all fetal and nearly all adult tissues, with the exception of thymus and peripheral blood leukocytes. A major mRNA species of 6.2 kb was most abundant in the ovary, with high expression also in liver, kidney, small intestine, and colon (Paine-Saunders et al., 1999; Veugelers et al., 1999). In situ hybridization studies localized glypican-6 predominantly to mesenchymal tissues in the developing mouse embryo. Veugelers et al. (1999) suggested that growth factor signaling in these tissues might be regulated in part by GPC6 on the cell surface. Paine-Saunders et al. (1999) and Veugelers et al. (1999) mapped the GPC6 gene to 13q32 in a tight cluster with GPC5 (OMIM Ref. No.

602446) by radiation hybrid techniques and FISH, respectively. The GPC6/GPC5 cluster is analogous to the GPC3/GPC4 (OMIM Ref. No. 300168) cluster on Xq26.

[14758] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14759] Paine-Saunders, S.; Viviano, B. L.; Saunders, S. : GPC6, a novel member of the glypican gene family, encodes a product structurally related to GPC4 and is colocalized with GPC5 on human chromosome 13. *Genomics* 57: 455-458, 1999. ; and

[14760] Veugelers, M.; De Cat, B.; Ceulemans, H.; Bruystens, A. M.; Coomans, C.; Durr, J.; Vermeesch, J.; Marynen, P.; David, G. : Glypican-6, a new member of the glypican family of cell surfa.

[14761] Further studies establishing the function and utilities of GPC6 are found in John Hopkins OMIM database record ID 604404, and in cited publications numbered 7442-7443 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Lamin B Receptor (LBR, Accession XM_001795) is another VGAM247 host target gene. LBR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by LBR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LBR BINDING SITE, designated SEQ ID:29853, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14762] Another function of VGAM247 is therefore inhibition of Lamin B Receptor (LBR, Accession XM_001795). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LBR. LFG (Accession XM_084780) is another VGAM247 host target gene. LFG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LFG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LFG BINDING SITE, designated SEQ ID:37696, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14763] Another function of VGAM247 is therefore inhibition of LFG (Accession XM_084780). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with LFG. V-yes-1 Yamaguchi Sarcoma Viral Related Oncogene Homolog (LYN, Accession NM_002350) is another VGAM247 host target gene. LYN BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LYN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LYN BINDING SITE, designated SEQ ID:8154, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14764] Another function of VGAM247 is therefore inhibition of V-yes-1 Yamaguchi Sarcoma Viral Related Oncogene Homolog (LYN, Accession NM_002350), a gene which is a Tyrosine kinase with similarity to murine tyrosine kinase p56lck; similar to v-yes protein and the gene products of v-fgr and v-src. Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LYN. The function of LYN has been established by previous studies. Parravicini et al. (2002) noted that Lyn deficiency impairs some mast cell functions, but degranulation and cytokine production are

intact. In Gab2 (OMIM Ref. No. 606203)–deficient mice, on the other hand, degranulation and cytokine production are impaired. Using immunoblot analysis, they showed that although Lyn is essential for Syk (OMIM Ref. No. 600085) activation and Lat (OMIM Ref. No. 602354) phosphorylation after Fc ϵ 1 (see OMIM Ref. No. FCER1G; 147139) aggregation, neither Lyn nor Lat are necessary for Gab2 phosphorylation. RT–PCR and coimmunoprecipitation analyses demonstrated abundant Fyn (OMIM Ref. No. 137025) expression in mast cells and an association with Gab2. In cells lacking Fyn, neither Gab2 nor Akt (OMIM Ref. No. 164730) were phosphorylated. Functional analysis showed that Lyn $-/-$ mast cells exhibited hyperdegranulation and enhanced PI3K (see OMIM Ref. No. 601232) activity and Akt phosphorylation, whereas in Fyn $-/-$ mast cells the degranulation response was inhibited. The inhibition was associated with decreased binding of PI3K with Gab2. Parravicini et al. (2002) observed that the degranulation response was independent of Fc ϵ 1 stimulation in Fyn–deficient mast cells and that degranulation was dependent on PI3K in wildtype and mutant cell lines. The degranulation response was dependent on a rise in intracellular calcium that was inhibited in Lyn–deficient

mast cells but intact in Fyn-deficient cells. Degranulation proceeded in Lyn $-/-$ cells due to increased activation and constitutive phosphorylation of the calcium-independent protein kinase C delta isoform (PRKCD; 176977). Paravicini et al. (2002) concluded that Fyn- and Lyn-initiated pathways synergize in late events at the level of protein kinase C and calcium, respectively, to regulate mast cell degranulation. Animal model experiments lend further support to the function of LYN. Hibbs et al. (1995) demonstrated that mice homozygous for a disruption of the Lyn locus display abnormalities associated with the B-lymphocyte lineage and in mast cell function. Despite reduced numbers of recirculating B lymphocytes, the homozygous deficient mice are immunoglobulin M hyperglobulinemic. Lyn-deficient mice show IgM hyperglobulinemia. Immune responses to T-independent and T-dependent antigens were affected. The deficient mice failed to mediate an allergic response to IgE cross-linking, indicating that activation of Lyn plays an indispensable role in signaling by the high-affinity IgE receptor (FCER). Homozygous deficient mice had circulating autoreactive antibodies, and many showed severe glomerulonephritis caused by the deposition of IgG immune complexes in the

kidney, a pathology reminiscent of systemic lupus erythematosus. Hibbs et al. (1995) stated that, collectively, these results implicated LYN as having an indispensable role in immunoglobulin-mediated signaling, particularly in establishing B cell tolerance. Harder et al. (2001) generated mice with a gain-of-function Lyn mutation (tyr508 to phe, which they referred to as 'up') analogous to the tyr527-to-phe activating mutation in the mouse Src gene (OMIM Ref. No. 190090) (Webster et al., 1995). Even aging mice with the Lyn up/up phenotype did not display hematologic malignancies, unlike Lyn $-/-$ mice, which developed splenomegaly, increased myeloid progenitors, and monocyte/macrophage tumors. Biochemical analysis revealed that Lyn is essential in establishing ITIM (immunoreceptor tyrosine-based inhibitory motif)-dependent signaling and for the activation of specific protein tyrosine phosphatases within myeloid cells, which may underlie the susceptibility of Lyn $-/-$ mice to tumorigenesis. Hasegawa et al. (2001) generated mice deficient in both Cd19 (OMIM Ref. No. 107265) and Lyn. Cd19 deficiency

[14765] It is appreciated that the abovementioned animal model for LYN is acknowledged by those skilled in the art as a

scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[14766] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14767] Harder, K. W.; Parsons, L. M.; Armes, J.; Evans, N.; Kountouri, N.; Clark, R.; Quillici, C.; Grail, D.; Hodgson, G. S.; Dunn, A. R.; Hibbs, M. L. : Gain- and loss-of-function Lyn mutant mice define a critical inhibitory role for Lyn in the myeloid lineage. *Immunity* 15: 603–615, 2001. ; and

[14768] Parravicini, V.; Gadina, M.; Kovarova, M.; Odom, S.; Gonzalez-Espinosa, C.; Furumoto, Y.; Saitoh, S.; Samelson, L. E.; O'Shea, J. J.; Rivera, J. : Fyn kinase initiates complementary signal.

[14769] Further studies establishing the function and utilities of LYN are found in John Hopkins OMIM database record ID 165120, and in cited publications numbered 2976, 4818, 510 and 5110–5111 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Methyl-CpG Binding Domain Protein 3 (MBD3, Accession NM_003926) is another VGAM247 host target gene. MBD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

MBD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBD3 BINDING SITE, designated SEQ ID:10022, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14770] Another function of VGAM247 is therefore inhibition of Methyl-CpG Binding Domain Protein 3 (MBD3, Accession NM_003926), a gene which are subunits of the NURD (nucleosome remodeling and histone deacetylase) complex . Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBD3. The function of MBD3 has been established by previous studies. The MECP2 (OMIM Ref. No. 300005) and MBD1 (OMIM Ref. No. 156535) proteins bind specifically to methylated DNA via a methyl-CpG-binding domain (MBD). Both proteins can repress transcription and appear to be important in interpreting the signal that methylation of DNA represents. By searching an EST database for proteins containing an MBD-like motif, Hendrich and Bird (1998) identified human and mouse cDNAs encoding the 3 novel proteins MBD2 (OMIM Ref. No. 603547), MBD3, and MBD4 (OMIM Ref. No.

603574). The predicted 291–amino acid human MBD3 protein (GenBank AF072247) is 94% identical to mouse Mbd3. MBD3 failed to specifically bind methylated DNA in vitro. A green fluorescence protein (GFP)–MBD3 fusion protein showed diffuse nuclear staining in cells in which it was expressed at low levels, and accumulated in many nuclear foci in cells in which it was expressed at high levels. However, MBD3 did not appear to associate with the highly methylated major satellite DNA in mouse cells. The authors identified cDNAs representing an alternatively spliced mouse Mbd3 mRNA that lacks the coding sequence for the N–terminal half of the MBD. RT–PCR analysis of many mouse tissues indicated that this shorter message constitutes a significant fraction of total Mbd3 transcripts. Northern blot analysis detected Mbd3 transcripts in all mouse tissues tested. Zhang et al. (1999) showed that MTA2 (MTA1L1; 603947) and the 32–kD MBD3 protein are subunits of the NURD (nucleosome remodeling and histone deacetylase) complex (see OMIM Ref. No. MTA1; 603526). Immunoprecipitation analysis showed that MBD3 interacts with HDAC1 (OMIM Ref. No. 601241), RBBP4 (OMIM Ref. No. 602923), and RBBP7 (OMIM Ref. No. 602922), but not with MI2 (CHD4;

603277), suggesting that MBD3 is embedded within the NURD complex. The authors found that MTA2 directs the assembly of an active histone deacetylase complex and that the association of MTA2 with the complex requires MBD3. Gel mobility shift analysis determined that both NURD and MBD3 are unable to bind to methylated DNA in the absence of MBD2. Zhang et al. (1999) proposed that NURD is involved in the transcriptional repression of methylated DNA. Wade et al. (1999) also identified MTA1, MTA1L, and MBD3 as components of the NURD complex, which they referred to as the MI2 complex.

[14771] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14772] Zhang, Y.; Ng, H.-H.; Erdjument-Bromage, H; Tempst, P.; Bird, A.; Reinberg, D. : Analysis of the NuRD subunits reveals a histone deacetylase core complex and a connection with DNA methylation. *Genes Dev.* 13: 1924–1935, 1999. ; and

[14773] Hendrich, B.; Bird, A. : Identification and characterization of a family of mammalian methyl-CpG binding proteins. *Molec. Cell. Biol.* 18: 6538–6547, 1998.

[14774] Further studies establishing the function and utilities of

MBD3 are found in John Hopkins OMIM database record ID 603573, and in cited publications numbered 2226, 5359–5360, 506 and 5361 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Megalencephalic Leukoencephalopathy with Subcortical Cysts 1 (MLC1, Accession NM_139202) is another VGAM247 host target gene. MLC1 BINDING SITE1 and MLC1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MLC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLC1 BINDING SITE1 and MLC1 BINDING SITE2, designated SEQ ID:29220 and SEQ ID:17526 respectively, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14775] Another function of VGAM247 is therefore inhibition of Megalencephalic Leukoencephalopathy with Subcortical Cysts 1 (MLC1, Accession NM_139202). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLC1. Sialidase 3 (membrane sialidase) (NEU3, Accession NM_006656) is another VGAM247 host target gene. NEU3

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEU3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEU3 BINDING SITE, designated SEQ ID:13455, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14776] Another function of VGAM247 is therefore inhibition of Sialidase 3 (membrane sialidase) (NEU3, Accession NM_006656). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEU3. Podocalyxin-like (PODXL, Accession NM_005397) is another VGAM247 host target gene. PODXL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PODXL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PODXL BINDING SITE, designated SEQ ID:11876, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14777] Another function of VGAM247 is therefore inhibition of Podocalyxin-like (PODXL, Accession NM_005397), a gene which is an antiadhesin. Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PODXL. The function of PODXL has been established by previous studies. The renal glomerular epithelial cell, or podocyte, is a highly differentiated cell with characteristic interdigitating foot processes covering the outer aspect of the glomerular basement membrane. The foot processes are covered on their apical surface with a polyanionic glycocalyx, which is an essential element of the glomerular filter. Podocalyxin, a sialoglycoprotein, is thought to be a major component of this glycocalyx. By screening human renal cortex and heart cDNA libraries with a rabbit podocalyxin-like protein-1 (PCLP1) cDNA, Kershaw et al. (1997) cloned cDNAs encoding human PCLP, or PODXL. Northern blot analysis revealed that PODXL is expressed as a major 5.9-kb transcript and minor 4.4- and 9.6-kb transcripts in various tissues, with highest expression in kidney, pancreas, and heart. The predicted 528-amino acid protein has a 21-amino acid signal peptide, a transmembrane domain, and a highly acidic intracellular domain. The amino

acid sequence of human PODXL is 48% identical to that of rabbit PCLP1, with 96% identity in the transmembrane and intracellular domains. The calculated molecular mass of PODXL is 54 kD. Western blot analysis of renal glomerular extracts showed that monoclonal antibodies against human PODXL recognize a 160/165-kD human PODXL doublet, rat podocalyxin, and rabbit PCLP1. Kershaw et al. (1997) suggested that the discrepancy between the calculated and observed masses of human PODXL is due to posttranslational modifications. By immunofluorescence of human kidney sections using antibodies against PODXL, Kershaw et al. (1997) found intense vascular endothelial cell and glomerular staining. Kershaw et al. (1997) mapped the human PODXL gene to 7q32-q33 by fluorescence in situ hybridization.

[14778] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14779] Kershaw, D. B.; Beck, S. G.; Wharram, B. L.; Wiggins, J. E.; Goyal, M.; Thomas, P. E.; Wiggins, R. C. : Molecular cloning and characterization of human podocalyxin-like protein: orthologous relationship to rabbit PCLP1 and rat podocalyxin. J. Biol. Chem. 272: 15708-15714, 1997. ;

and

[14780] Kershaw, D. B.; Wiggins, J. E.; Wharram, B. L.; Wiggins, R. C. : Assignment of the human podocalyxin-like protein (PODXL) gene to 7q32-q33. Genomics 45: 239-240, 1997.

[14781] Further studies establishing the function and utilities of PODXL are found in John Hopkins OMIM database record ID 602632, and in cited publications numbered 8749-8750 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 2 (facilitated glucose transporter), Member 3 (SLC2A3, Accession NM_006931) is another VGAM247 host target gene. SLC2A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC2A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC2A3 BINDING SITE, designated SEQ ID:13817, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14782] Another function of VGAM247 is therefore inhibition of Solute Carrier Family 2 (facilitated glucose transporter),

Member 3 (SLC2A3, Accession NM_006931), a gene which probably is a neuronal glucose transporter. Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC2A3. The function of SLC2A3 has been established by previous studies. Gould and Holman (1993), who provided a review of the glucose transporter family, referred to GLUT3 as the brain-type glucose transporter. It appears that high GLUT3 protein expression is confined generally to tissues that exhibit a high glucose demand, such as brain and nerve. Hauguel-de Mouzon et al. (1997) examined the cellular localization of GLUT3 mRNA and protein. In situ hybridization showed that GLUT3 mRNA was present in the trophoblast cell layer and in vascular endothelium with a heterogeneous distribution pattern. GLUT3 protein, migrating at an apparent molecular mass of 49 kD, was detected by immunoblotting in membranes from whole placenta and endothelial cells derived from intraplacental microvessels, but not in isolated trophoblast cells. This cell-specific pattern of expression was confirmed by immunocytochemical studies showing localization of GLUT3 protein in vascular endothelium. Based on the cell-specific distribution of GLUT3 protein at the

fetal interface, the authors suggested that this protein may be important in the transport of glucose from the placenta to the fetal circulation.

[14783] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14784] Gould, G. W.; Holman, G. D. : The glucose transporter family: structure, function and tissue-specific expression. *Biochem. J.* 295: 329–341, 1993. ; and

[14785] Hauguel-de Mouzon, S.; Challier, J. C.; Kacemi, A.; Cauzac, M.; Malek, A.; Girard, J. : The GLUT3 glucose transporter isoform is differentially expressed within human placental cell types.

[14786] Further studies establishing the function and utilities of SLC2A3 are found in John Hopkins OMIM database record ID 138170, and in cited publications numbered 11908–11912 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transcription Elongation Factor A (SII), 1 (TCEA1, Accession XM_087370) is another VGAM247 host target gene. TCEA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCEA1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCEA1 BINDING SITE, designated SEQ ID:39203, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14787] Another function of VGAM247 is therefore inhibition of Transcription Elongation Factor A (SII), 1 (TCEA1, Accession XM_087370), a gene which helps RNA polymerase II to transcribe past blockages. Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCEA1. The function of TCEA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM211.TIC (Accession NM_012455) is another VGAM247 host target gene. TIC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIC BINDING SITE, designated SEQ ID:14829, to the nucleotide sequence of

VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14788] Another function of VGAM247 is therefore inhibition of TIC (Accession NM_012455). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIC. TSG (Accession NM_020648) is another VGAM247 host target gene. TSG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSG BINDING SITE, designated SEQ ID:21812, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14789] Another function of VGAM247 is therefore inhibition of TSG (Accession NM_020648). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSG. Thioredoxin Reductase 1 (TXNRD1, Accession NM_003330) is another VGAM247 host target gene. TXNRD1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by

TXNRD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TXNRD1 BINDING SITE, designated SEQ ID:9336, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14790] Another function of VGAM247 is therefore inhibition of Thioredoxin Reductase 1 (TXNRD1, Accession NM_003330), a gene which acts as an antioxidant enzyme and is involved in maintaining redox balance. Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TXNRD1. The function of TXNRD1 has been established by previous studies. Thioredoxin reductase (EC 1.6.4.5) is a key enzyme in the regulation of the intracellular redox environment. Gasdaska et al. (1995) purified human thioredoxin reductase from placenta and obtained amino acid sequence from tryptic peptides. Based on protein sequence data, the authors designed degenerate PCR primers and used them to screen a human placental cDNA library. The authors obtained a 3.8-kb cDNA encoding a predicted 495-amino acid protein that is 40% identical to

glutathione reductase and 24% identical to thioredoxin reductase from *E. coli*. The protein is predicted to contain a FAD-binding domain, as expected, but this activity could not be demonstrated with recombinantly expressed enzyme. By Northern blot analysis, Gasdaska et al. (1996) found that thioredoxin reductase was expressed in all tissues examined but at varying levels. The authors found no correlation between the relative expression levels of thioredoxin and thioredoxin reductase. See also selenocysteine-containing thioredoxin reductase (OMIM Ref. No. 601339). Selenium has been indirectly implicated in immunologic function and numerous nutritional studies over many years. Furthermore, HIV-infected persons are reported to have decreased levels of plasma selenium and selenium-containing glutathione peroxidase (e.g., 138321). For this reason, Gladyshev et al. (1996) initiated studies on selenium metabolism in human T cells. The authors identified one of the selenoproteins detected in T cells as thioredoxin reductase and demonstrated that the location of selenocysteine in this protein corresponds to a TGA codon in the cloned placental gene. The finding that T-cell thioredoxin reductase is a selenoenzyme that contains selenium in a conserved C-terminal region provides

another example of the role of selenium in the major antioxidant enzyme system (i.e., thioredoxin–thioredoxin reductase), in addition to the well-known glutathione peroxidase enzyme system.

[14791] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14792] Gasdaska, J. R.; Gasdaska, P. Y.; Gallegos, A.; Powis, G. : Human thioredoxin reductase gene localization to chromosomal position 12q23–q24.1 and mRNA distribution in human tissue. *Genomics* 37: 257–259, 1996. ; and

[14793] Gasdaska, P. Y.; Gasdaska, J. R.; Cochran, S.; Powis, G. : Cloning and sequencing of a human thioredoxin reductase. *FEBS Lett.* 373: 5–9, 1995.

[14794] Further studies establishing the function and utilities of TXNRD1 are found in John Hopkins OMIM database record ID 601112, and in cited publications numbered 10041–1004 and 9635 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. A2BP1 (Accession NM_018723) is another VGAM247 host target gene. A2BP1 BINDING SITE1 and A2BP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by A2BP1, corre–

sponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of A2BP1 BINDING SITE1 and A2BP1 BINDING SITE2, designated SEQ ID:20807 and SEQ ID:20808 respectively, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14795] Another function of VGAM247 is therefore inhibition of A2BP1 (Accession NM_018723). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with A2BP1. Ras Homolog Gene Family, Member U (ARHU, Accession NM_021205) is another VGAM247 host target gene. ARHU BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHU BINDING SITE, designated SEQ ID:22184, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14796] Another function of VGAM247 is therefore inhibition of Ras Homolog Gene Family, Member U (ARHU, Accession

NM_021205). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHU. DKFZp547I094 (Accession NM_032155) is another VGAM247 host target gene. DKFZp547I094 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547I094, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547I094 BINDING SITE, designated SEQ ID:25857, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14797] Another function of VGAM247 is therefore inhibition of DKFZp547I094 (Accession NM_032155). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547I094. Double C2-like Domains, Beta (DOC2B, Accession NM_003585) is another VGAM247 host target gene. DOC2B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DOC2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of DOC2B BINDING SITE, designated SEQ ID:9638, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14798] Another function of VGAM247 is therefore inhibition of Double C2-like Domains, Beta (DOC2B, Accession NM_003585). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOC2B. FASTK (Accession NM_025096) is another VGAM247 host target gene. FASTK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FASTK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FASTK BINDING SITE, designated SEQ ID:24730, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14799] Another function of VGAM247 is therefore inhibition of FASTK (Accession NM_025096). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FASTK.

FLJ12975 (Accession XM_045522) is another VGAM247 host target gene. FLJ12975 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12975, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12975 BINDING SITE, designated SEQ ID:34480, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14800] Another function of VGAM247 is therefore inhibition of FLJ12975 (Accession XM_045522). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12975. FLJ14297 (Accession NM_024903) is another VGAM247 host target gene. FLJ14297 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14297 BINDING SITE, designated SEQ ID:24391, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2958.

[14801] Another function of VGAM247 is therefore inhibition of FLJ14297 (Accession NM_024903). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14297. FLJ21687 (Accession NM_024859) is another VGAM247 host target gene. FLJ21687 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21687 BINDING SITE, designated SEQ ID:24290, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14802] Another function of VGAM247 is therefore inhibition of FLJ21687 (Accession NM_024859). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21687. FLJ22559 (Accession NM_024928) is another VGAM247 host target gene. FLJ22559 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22559, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22559 BINDING SITE, designated SEQ ID:24465, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14803] Another function of VGAM247 is therefore inhibition of FLJ22559 (Accession NM_024928). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22559. FLJ23071 (Accession NM_025192) is another VGAM247 host target gene. FLJ23071 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23071 BINDING SITE, designated SEQ ID:24847, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14804] Another function of VGAM247 is therefore inhibition of FLJ23071 (Accession NM_025192). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ23071. FLJ23168 (Accession NM_025055) is another VGAM247 host target gene. FLJ23168 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23168, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23168 BINDING SITE, designated SEQ ID:24652, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14805] Another function of VGAM247 is therefore inhibition of FLJ23168 (Accession NM_025055). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23168. jdp2 (Accession NM_130469) is another VGAM247 host target gene. jdp2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by jdp2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of jdp2 BINDING SITE, designated SEQ ID:28230, to the nucleotide sequence of VGAM247 RNA,

herein designated VGAM RNA, also designated SEQ ID:2958.

[14806] Another function of VGAM247 is therefore inhibition of jdp2 (Accession NM_130469). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with jdp2. KIAA0557 (Accession XM_085507) is another VGAM247 host target gene. KIAA0557 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0557, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0557 BINDING SITE, designated SEQ ID:38207, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14807] Another function of VGAM247 is therefore inhibition of KIAA0557 (Accession XM_085507). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0557. KIAA0599 (Accession XM_085127) is another VGAM247 host target gene. KIAA0599 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by KIAA0599, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0599 BINDING SITE, designated SEQ ID:37857, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14808] Another function of VGAM247 is therefore inhibition of KIAA0599 (Accession XM_085127). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0599. KIAA0674 (Accession XM_027054) is another VGAM247 host target gene. KIAA0674 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0674, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0674 BINDING SITE, designated SEQ ID:30400, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14809] Another function of VGAM247 is therefore inhibition of KIAA0674 (Accession XM_027054). Accordingly, utilities

of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0674. KIAA1340 (Accession XM_044836) is another VGAM247 host target gene. KIAA1340 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1340 BINDING SITE, designated SEQ ID:34296, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14810] Another function of VGAM247 is therefore inhibition of KIAA1340 (Accession XM_044836). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1340. KIAA1465 (Accession XM_027396) is another VGAM247 host target gene. KIAA1465 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1465 BINDING SITE, designated SEQ ID:30505, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14811] Another function of VGAM247 is therefore inhibition of KIAA1465 (Accession XM_027396). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1465. KIAA1649 (Accession NM_032311) is another VGAM247 host target gene. KIAA1649 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1649, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1649 BINDING SITE, designated SEQ ID:26109, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14812] Another function of VGAM247 is therefore inhibition of KIAA1649 (Accession NM_032311). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1649. KIAA1918 (Accession XM_054951) is another VGAM247 host target gene. KIAA1918 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1918 BINDING SITE, designated SEQ ID:36215, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14813] Another function of VGAM247 is therefore inhibition of KIAA1918 (Accession XM_054951). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1918. MGC11349 (Accession NM_025112) is another VGAM247 host target gene. MGC11349 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC11349, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11349 BINDING SITE, designated SEQ ID:24760, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14814] Another function of VGAM247 is therefore inhibition of

MGC11349 (Accession NM_025112). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11349. MGC2821 (Accession NM_024054) is another VGAM247 host target gene. MGC2821 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC2821, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2821 BINDING SITE, designated SEQ ID:23489, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14815] Another function of VGAM247 is therefore inhibition of MGC2821 (Accession NM_024054). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2821. MGC35558 (Accession NM_145013) is another VGAM247 host target gene. MGC35558 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC35558, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of MGC35558 BINDING SITE, designated SEQ ID:29614, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14816] Another function of VGAM247 is therefore inhibition of MGC35558 (Accession NM_145013). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC35558. MGC4368 (Accession NM_024510) is another VGAM247 host target gene. MGC4368 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC4368, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4368 BINDING SITE, designated SEQ ID:23700, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14817] Another function of VGAM247 is therefore inhibition of MGC4368 (Accession NM_024510). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4368. MGC7036 (Accession NM_145058) is another

VGAM247 host target gene. MGC7036 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC7036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC7036 BINDING SITE, designated SEQ ID:29694, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14818] Another function of VGAM247 is therefore inhibition of MGC7036 (Accession NM_145058). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC7036. Prostate Cancer Associated Protein 7 (PCANAP7, Accession XM_167803) is another VGAM247 host target gene. PCANAP7 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PCANAP7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCANAP7 BINDING SITE, designated SEQ ID:44838, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2958.

[14819] Another function of VGAM247 is therefore inhibition of Prostate Cancer Associated Protein 7 (PCANAP7, Accession XM_167803). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCANAP7. Phosphatidylinositol-4-phosphate 5-kinase, Type II, Beta (PIP5K2B, Accession NM_138687) is another VGAM247 host target gene. PIP5K2B BINDING SITE1 and PIP5K2B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PIP5K2B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP5K2B BINDING SITE1 and PIP5K2B BINDING SITE2, designated SEQ ID:28930 and SEQ ID:9614 respectively, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14820] Another function of VGAM247 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, Type II, Beta (PIP5K2B, Accession NM_138687). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K2B.

SNF1 Sucrose Nonfermenting Like Kinase (yeast) (SLK, Accession NM_014720) is another VGAM247 host target gene. SLK BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLK BINDING SITE, designated SEQ ID:16281, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14821] Another function of VGAM247 is therefore inhibition of SNF1 Sucrose Nonfermenting Like Kinase (yeast) (SLK, Accession NM_014720). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLK. ZFP106 (Accession NM_022473) is another VGAM247 host target gene. ZFP106 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZFP106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP106 BINDING SITE, designated SEQ ID:22833, to the nucleotide sequence of VGAM247 RNA,

herein designated VGAM RNA, also designated SEQ ID:2958.

[14822] Another function of VGAM247 is therefore inhibition of ZFP106 (Accession NM_022473). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP106. LOC130617 (Accession NM_138802) is another VGAM247 host target gene. LOC130617 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC130617, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130617 BINDING SITE, designated SEQ ID:29025, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14823] Another function of VGAM247 is therefore inhibition of LOC130617 (Accession NM_138802). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130617. LOC132332 (Accession XM_072306) is another VGAM247 host target gene. LOC132332 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC132332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132332 BINDING SITE, designated SEQ ID:37488, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14824] Another function of VGAM247 is therefore inhibition of LOC132332 (Accession XM_072306). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132332. LOC144195 (Accession XM_016498) is another VGAM247 host target gene. LOC144195 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144195 BINDING SITE, designated SEQ ID:30265, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14825] Another function of VGAM247 is therefore inhibition of LOC144195 (Accession XM_016498). Accordingly, utilities

of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144195. LOC144893 (Accession XM_096687) is another VGAM247 host target gene. LOC144893 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144893, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144893 BINDING SITE, designated SEQ ID:40461, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14826] Another function of VGAM247 is therefore inhibition of LOC144893 (Accession XM_096687). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144893. LOC146375 (Accession XM_085434) is another VGAM247 host target gene. LOC146375 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146375, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC146375 BINDING SITE, designated SEQ ID:38141, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14827] Another function of VGAM247 is therefore inhibition of LOC146375 (Accession XM_085434). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146375. LOC157543 (Accession XM_088325) is another VGAM247 host target gene. LOC157543 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157543, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157543 BINDING SITE, designated SEQ ID:39611, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14828] Another function of VGAM247 is therefore inhibition of LOC157543 (Accession XM_088325). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157543. LOC201294 (Accession XM_113950) is another VGAM247 host target gene. LOC201294 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201294 BINDING SITE, designated SEQ ID:42568, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14829] Another function of VGAM247 is therefore inhibition of LOC201294 (Accession XM_113950). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201294. LOC202181 (Accession XM_114456) is another VGAM247 host target gene. LOC202181 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202181, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202181 BINDING SITE, designated SEQ ID:42969, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14830] Another function of VGAM247 is therefore inhibition of

LOC202181 (Accession XM_114456). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202181. LOC203084 (Accession XM_113540) is another VGAM247 host target gene. LOC203084 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203084, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203084 BINDING SITE, designated SEQ ID:42281, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14831] Another function of VGAM247 is therefore inhibition of LOC203084 (Accession XM_113540). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203084. LOC203427 (Accession XM_114699) is another VGAM247 host target gene. LOC203427 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203427, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC203427 BINDING SITE, designated SEQ ID:43045, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14832] Another function of VGAM247 is therefore inhibition of LOC203427 (Accession XM_114699). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203427. LOC219855 (Accession XM_166184) is another VGAM247 host target gene. LOC219855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219855 BINDING SITE, designated SEQ ID:43997, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14833] Another function of VGAM247 is therefore inhibition of LOC219855 (Accession XM_166184). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219855. LOC219994 (Accession XM_167792) is an-

other VGAM247 host target gene. LOC219994 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219994, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219994 BINDING SITE, designated SEQ ID:44835, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14834] Another function of VGAM247 is therefore inhibition of LOC219994 (Accession XM_167792). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219994. LOC51103 (Accession XM_031645) is another VGAM247 host target gene. LOC51103 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51103 BINDING SITE, designated SEQ ID:31446, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:2958.

[14835] Another function of VGAM247 is therefore inhibition of LOC51103 (Accession XM_031645). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51103. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 248 (VGAM248) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14836] VGAM248 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM248 was detected is described hereinabove with reference to Figs. 1–8.

[14837] VGAM248 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM248 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14838] VGAM248 gene encodes a VGAM248 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM248

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM248 precursor RNA is designated SEQ ID:234, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:234 is located at position 106248 relative to the genome of Calitrichine Herpesvirus 3.

[14839] VGAM248 precursor RNA folds onto itself, forming VGAM248 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14840] An enzyme complex designated DICER COMPLEX, `dices` the VGAM248 folded precursor RNA into VGAM248 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 53%) nucleotide sequence of VGAM248 RNA is designated SEQ ID:2959, and is provided hereinbelow with reference to the sequence listing part.

[14841] VGAM248 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM248 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM248 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[14842] VGAM248 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM248 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM248 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM248 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM248 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[14843] The complementary binding of VGAM248 RNA, herein designated VGAM RNA, to host target binding sites on VGAM248 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM248 host target RNA into VGAM248 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14844] It is appreciated that VGAM248 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM248 host target genes. The mRNA of each one of this plurality of VGAM248 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM248 RNA, herein designated VGAM RNA, and which when bound by VGAM248 RNA causes inhibition of translation of respective one or more VGAM248 host target proteins.

[14845] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM248 gene, herein designated VGAM GENE, on one or more VGAM248 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[14846] It is yet further appreciated that a function of VGAM248 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM248 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM248 correlate with, and may be deduced from, the identity of the host target genes which VGAM248 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14847] Nucleotide sequences of the VGAM248 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM248 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM248 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM248 are further described hereinbelow with reference to Table 1.

[14848] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM248 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM248 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[14849] As mentioned hereinabove with reference to Fig. 1, a function of VGAM248 gene, herein designated VGAM is inhibition of expression of VGAM248 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM248 correlate with, and may be deduced from, the identity of the target genes which VGAM248 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14850] BCLG (Accession NM_030766) is a VGAM248 host target gene. BCLG BINDING SITE1 and BCLG BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BCLG, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCLG BINDING SITE1 and BCLG BINDING SITE2, designated SEQ ID:25053 and SEQ ID:28967 respectively, to the nucleotide sequence of VGAM248 RNA, herein designated VGAM RNA, also designated SEQ ID:2959.

[14851] A function of VGAM248 is therefore inhibition of BCLG (Accession NM_030766). Accordingly, utilities of VGAM248 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with BCLG. Zinc Finger Protein 42 (myeloid-specific retinoic acid- responsive) (ZNF42, Accession NM_003422) is another VGAM248 host target gene. ZNF42 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF42, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF42 BINDING SITE, designated SEQ ID:9468, to the nucleotide sequence of VGAM248 RNA, herein designated VGAM RNA, also designated SEQ ID:2959.

[14852] Another function of VGAM248 is therefore inhibition of Zinc Finger Protein 42 (myeloid-specific retinoic acid- responsive) (ZNF42, Accession NM_003422), a gene which may be one regulator of transcriptional events during hemopoietic development. Accordingly, utilities of VGAM248 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF42. The function of ZNF42 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173.DKFZP434I0714 (Accession XM_098247) is

another VGAM248 host target gene. DKFZP434I0714 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434I0714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434I0714 BINDING SITE, designated SEQ ID:41531, to the nucleotide sequence of VGAM248 RNA, herein designated VGAM RNA, also designated SEQ ID:2959.

[14853] Another function of VGAM248 is therefore inhibition of DKFZP434I0714 (Accession XM_098247). Accordingly, utilities of VGAM248 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434I0714. FLJ14082 (Accession NM_025024) is another VGAM248 host target gene. FLJ14082 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14082 BINDING SITE, designated SEQ ID:24611, to the nucleotide sequence of VGAM248 RNA, herein designated

VGAM RNA, also designated SEQ ID:2959.

[14854] Another function of VGAM248 is therefore inhibition of FLJ14082 (Accession NM_025024). Accordingly, utilities of VGAM248 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14082. KIAA0632 (Accession NM_015545) is another VGAM248 host target gene. KIAA0632 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0632, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0632 BINDING SITE, designated SEQ ID:17806, to the nucleotide sequence of VGAM248 RNA, herein designated VGAM RNA, also designated SEQ ID:2959.

[14855] Another function of VGAM248 is therefore inhibition of KIAA0632 (Accession NM_015545). Accordingly, utilities of VGAM248 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0632. KIAA1010 (Accession XM_050742) is another VGAM248 host target gene. KIAA1010 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1010, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1010 BINDING SITE, designated SEQ ID:35669, to the nucleotide sequence of VGAM248 RNA, herein designated VGAM RNA, also designated SEQ ID:2959.

[14856] Another function of VGAM248 is therefore inhibition of KIAA1010 (Accession XM_050742). Accordingly, utilities of VGAM248 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1010. LOC148089 (Accession XM_086040) is another VGAM248 host target gene. LOC148089 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148089, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148089 BINDING SITE, designated SEQ ID:38449, to the nucleotide sequence of VGAM248 RNA, herein designated VGAM RNA, also designated SEQ ID:2959.

[14857] Another function of VGAM248 is therefore inhibition of LOC148089 (Accession XM_086040). Accordingly, utilities of VGAM248 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC148089. LOC222031 (Accession XM_168371) is another VGAM248 host target gene. LOC222031 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222031, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222031 BINDING SITE, designated SEQ ID:45130, to the nucleotide sequence of VGAM248 RNA, herein designated VGAM RNA, also designated SEQ ID:2959.

[14858] Another function of VGAM248 is therefore inhibition of LOC222031 (Accession XM_168371). Accordingly, utilities of VGAM248 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222031. LOC93589 (Accession XM_052387) is another VGAM248 host target gene. LOC93589 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93589, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93589 BINDING SITE, designated SEQ ID:35980, to the

nucleotide sequence of VGAM248 RNA, herein designated VGAM RNA, also designated SEQ ID:2959.

[14859] Another function of VGAM248 is therefore inhibition of LOC93589 (Accession XM_052387). Accordingly, utilities of VGAM248 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93589. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 249 (VGAM249) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14860] VGAM249 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM249 was detected is described hereinabove with reference to Figs. 1–8.

[14861] VGAM249 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM249 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14862] VGAM249 gene encodes a VGAM249 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM249 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM249 precursor RNA is designated SEQ ID:235, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:235 is located at position 15261 relative to the genome of Calitrichine Herpesvirus 3.

[14863] VGAM249 precursor RNA folds onto itself, forming VGAM249 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14864] An enzyme complex designated DICER COMPLEX, `dices` the VGAM249 folded precursor RNA into VGAM249 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM249 RNA is designated SEQ ID:2960, and is provided hereinbelow with reference to the sequence listing part.

[14865] VGAM249 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM249 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM249 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[14866] VGAM249 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM249 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM249 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM249 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM249 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[14867] The complementary binding of VGAM249 RNA, herein designated VGAM RNA, to host target binding sites on VGAM249 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM249 host target RNA into VGAM249 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14868] It is appreciated that VGAM249 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM249 host target genes. The mRNA of each one of this plurality of VGAM249 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM249 RNA, herein designated VGAM RNA, and which when bound by VGAM249 RNA causes inhibition of translation of respective one or more VGAM249 host target proteins.

[14869] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM249 gene, herein designated VGAM GENE, on one or more VGAM249 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[14870] It is yet further appreciated that a function of VGAM249 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM249 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM249 correlate with, and may be deduced from, the identity of the host target genes which VGAM249 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14871] Nucleotide sequences of the VGAM249 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM249 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM249 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM249 are further described hereinbelow with reference to Table 1.

[14872] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM249 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM249 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14873] As mentioned hereinabove with reference to Fig. 1, a function of VGAM249 gene, herein designated VGAM is inhibition of expression of VGAM249 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM249 correlate with, and may be deduced from, the identity of the target genes which VGAM249 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14874] Ubiquitin-conjugating Enzyme E2G 2 (UBC7 homolog, yeast) (UBE2G2, Accession XM_036087) is a VGAM249 host target gene. UBE2G2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE2G2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2G2 BINDING SITE, designated SEQ ID:32376, to the nucleotide sequence of VGAM249 RNA, herein designated VGAM RNA, also designated SEQ ID:2960.

[14875] A function of VGAM249 is therefore inhibition of Ubiqui-

tin-conjugating Enzyme E2G 2 (UBC7 homolog, yeast) (UBE2G2, Accession XM_036087), a gene which catalyzes the covalent attachment of ubiquitin to other proteins. Accordingly, utilities of VGAM249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2G2. The function of UBE2G2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM164. LOC147118 (Accession XM_097200) is another VGAM249 host target gene. LOC147118 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147118, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147118 BINDING SITE, designated SEQ ID:40807, to the nucleotide sequence of VGAM249 RNA, herein designated VGAM RNA, also designated SEQ ID:2960.

[14876] Another function of VGAM249 is therefore inhibition of LOC147118 (Accession XM_097200). Accordingly, utilities of VGAM249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC147118. LOC148089 (Accession XM_086040) is another VGAM249 host target gene. LOC148089 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148089, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148089 BINDING SITE, designated SEQ ID:38452, to the nucleotide sequence of VGAM249 RNA, herein designated VGAM RNA, also designated SEQ ID:2960.

[14877] Another function of VGAM249 is therefore inhibition of LOC148089 (Accession XM_086040). Accordingly, utilities of VGAM249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148089. LOC220883 (Accession XM_166076) is another VGAM249 host target gene. LOC220883 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220883, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220883 BINDING SITE, designated SEQ ID:43851, to the nucleotide sequence of VGAM249 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2960.

[14878] Another function of VGAM249 is therefore inhibition of LOC220883 (Accession XM_166076). Accordingly, utilities of VGAM249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220883. LOC51279 (Accession NM_016546) is another VGAM249 host target gene. LOC51279 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51279, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51279 BINDING SITE, designated SEQ ID:18617, to the nucleotide sequence of VGAM249 RNA, herein designated VGAM RNA, also designated SEQ ID:2960.

[14879] Another function of VGAM249 is therefore inhibition of LOC51279 (Accession NM_016546). Accordingly, utilities of VGAM249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51279. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 250 (VGAM250) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14880] VGAM250 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM250 was detected is described hereinabove with reference to Figs. 1–8.

[14881] VGAM250 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM250 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14882] VGAM250 gene encodes a VGAM250 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM250 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM250 precursor RNA is designated SEQ ID:236, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:236 is located at position 23102 relative to the genome of Callitrichine Herpesvirus 3.

[14883] VGAM250 precursor RNA folds onto itself, forming

VGAM250 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14884] An enzyme complex designated DICER COMPLEX, `dices` the VGAM250 folded precursor RNA into VGAM250 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM250 RNA is designated SEQ ID:2961, and is provided hereinbelow with reference to the sequence listing part.

[14885] VGAM250 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM250 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM250 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[14886] VGAM250 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM250 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM250 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM250 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM250 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[14887] The complementary binding of VGAM250 RNA, herein designated VGAM RNA, to host target binding sites on VGAM250 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM250 host target RNA into VGAM250 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14888] It is appreciated that VGAM250 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM250 host target genes. The mRNA of each one of this plurality of VGAM250 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM250 RNA, herein designated VGAM RNA, and which when bound by VGAM250 RNA causes inhibition of translation of respective one or more VGAM250 host target proteins.

[14889] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM250 gene, herein designated VGAM GENE, on one or more VGAM250 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[14890] It is yet further appreciated that a function of VGAM250 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM250 correlate with, and may be deduced from, the identity of the host target genes which VGAM250 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[14891] Nucleotide sequences of the VGAM250 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM250 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM250 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM250 are further described hereinbelow with reference to Table 1.

[14892] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM250 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM250 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14893] As mentioned hereinabove with reference to Fig. 1, a function of VGAM250 gene, herein designated VGAM is inhibition of expression of VGAM250 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM250 correlate with, and may be deduced from, the identity of the target genes which VGAM250 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[14894] Optic Atrophy 3 (autosomal recessive, with chorea and spastic paraplegia) (OPA3, Accession NM_025136) is a VGAM250 host target gene. OPA3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OPA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPA3 BINDING SITE, designated SEQ ID:24774, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:2961.

[14895] A function of VGAM250 is therefore inhibition of Optic Atrophy 3 (autosomal recessive, with chorea and spastic paraplegia) (OPA3, Accession NM_025136). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPA3. Secreted Frizzled-related Protein 1 (SFRP1, Accession NM_003012) is another VGAM250 host target gene. SFRP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SFRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of SFRP1 BINDING SITE, designated SEQ ID:8931, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:2961.

[14896] Another function of VGAM250 is therefore inhibition of Secreted Frizzled-related Protein 1 (SFRP1, Accession NM_003012), a gene which is a receptor for wnt proteins that may have an anti-apoptotic function. Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRP1. The function of SFRP1 has been established by previous studies. A frequent epigenetic change in cancer involves aberrantly hypermethylated CpG islands in gene promoters, with loss of transcription of the genes (Baylin and Herman, (2000)) Cameron et al. (1999) showed that silencing of hypermethylated genes in cancer is dependent on both methylation of dense CpG islands and histone deacetylase (see OMIM Ref. No. 601241) activity. Suzuki et al. (2002) used cDNA microarray analysis to screen for genes that are epigenetically silenced in human colorectal cancer. By screening over 10,000 genes, they showed that they could identify a substantial number of

genes with promoter hypermethylation in a given cancer; these are distinct from genes with unmethylated promoters, for which increased expression is produced by histone deacetylase inhibition alone. Many of the hypermethylated genes identified have high potential for roles in tumorigenesis by virtue of their predicted function and chromosome position. They also identified a group of genes that are preferentially hypermethylated in colorectal cancer and gastric cancer. One of these genes, SFRP1, belongs to a gene family; Suzuki et al. (2002) showed that hypermethylation of 4 genes in this family occur frequently in colorectal cancer, providing for (i) a unique potential mechanism for loss of tumor suppressor gene function and (ii) construction of a molecular marker panel that could detect virtually all colorectal cancer. Fukuhara et al. (2002) investigated the expression and function of SFRP1 in uterine leiomyomas. Northern and Western blot analyses detected increased SFRP1 expression in leiomyomas compared with normal myometrium. Expression was strongest in the late follicular phase (high estrogenic milieu) of the menstrual cycle. Interestingly, expression was negligible in leiomyomas treated with GNRH agonist. The authors concluded that strong SFRP1 expression, which

appeared to be independent of cell proliferation, under high estrogenic conditions contributes to the development of uterine leiomyomas through the antiapoptotic effect of SFRP1.

[14897] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14898] Suzuki, H.; Gabrielson, E.; Chen, W.; Anbazhagan, R.; van Engeland, M.; Weijenberg, M. P.; Herman, J. G.; Baylin, S. B. : A genomic screen for genes upregulated by demethylation and histone deacetylase inhibition in human colorectal cancer. *Nature Genet.* 31: 141–149, 2002. ; and

[14899] Fukuhara, K.; Kariya, M.; Kita, M.; Shime, H.; Kanamori, T.; Kosaka, C.; Orii, A.; Fujita, J.; Fujii, S. : Secreted frizzled related protein 1 is overexpressed in uterine leiomyomas, *ass.*

[14900] Further studies establishing the function and utilities of SFRP1 are found in John Hopkins OMIM database record ID 604156, and in cited publications numbered 420–425 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Steroid Sulfatase (microsomal), Arylsulfatase C, Isozyme S (STS, Accession NM_000351) is another VGAM250 host target gene. STS

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STS BINDING SITE, designated SEQ ID:5909, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:2961.

[14901] Another function of VGAM250 is therefore inhibition of Steroid Sulfatase (microsomal), Arylsulfatase C, Isozyme S (STS, Accession NM_000351). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STS. TNF Receptor-associated Factor 1 (TRAF1, Accession NM_005658) is another VGAM250 host target gene. TRAF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRAF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAF1 BINDING SITE, designated SEQ ID:12199, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ

ID:2961.

[14902] Another function of VGAM250 is therefore inhibition of TNF Receptor-associated Factor 1 (TRAF1, Accession NM_005658), a gene which signal transducer associated with the cytoplasmic domain of the 75 kda tumor necrosis factor receptor (tnf-r2). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF1. The function of TRAF1 has been established by previous studies. In order to determine how tumor necrosis factor (TNF; 191160) elicits cellular response, factors that interact with the cytoplasmic domain of TNF receptor-2 (TNFR2; 191191) were identified. Rothe et al. (1994) used the yeast-based 2-hybrid system to detect mouse proteins that interact with TNFR2. They identified and cloned 2 TNF receptor-associated factors, which they termed TRAF1 and TRAF2 (OMIM Ref. No. 601895). Each of the TRAFs contains a C-terminal TRAF domain of approximately 230 amino acids. TRAF1 and TRAF2 can form both homo- and heterodimers. Mosialos et al. (1995) identified the human homolog of TRAF1 as Epstein-Barr virus (EBV)-induced mRNA 6 (EBI6), an mRNA that is more abundant in EBV-infected B lymphoblasts than in uninfected control cells.

The predicted 416-amino acid human protein is 86% identical to mouse TRAF1. Both the human and mouse proteins contain N-terminal zinc finger motifs and C-terminal TRAF domains. Northern blot analysis revealed that the 2.6-kb EBI6 mRNA is expressed in lung, spleen, tonsil, and weakly in placenta. Mosialos et al. (1995) found that LMP1, the EBV-transforming protein, specifically associates with LAP1 (TRAF3) or EBI6 in B lymphoblasts. LMP1 expression redirects LAP1 and EBI6 from scattered cytoplasmic structures to LMP1 plasma membrane patches. Both LAP1 and EBI6 associated with the cytoplasmic domain of p80/TNFR2 in vivo. The authors stated that the interaction of LMP1 with the LAP1 and EBI6 TNFR-associated proteins is evidence for the role of these proteins in signaling, and links LMP1-mediated transformation to signal transduction from the TNFR family. The structural hallmark of signal-transducing proteins associated with members of the TNFR superfamily is a novel C-terminal homology region of 230 amino acids, designated the TRAF domain. This domain is involved in a variety of specific protein-protein interactions. Siemienski et al. (1997) found that the human TRAF1 gene has a total length of approximately 12 kb. It is split into 6 exons, 4

of which encode parts of the TRAF domain. Analysis of the genomic structure of the TRAF domains of TRAF2 and TRAF3 (OMIM Ref. No. 601896) suggest that these domains are also encoded by several exons. Animal model experiments lend further support to the function of TRAF1. Tsitsikov et al. (2001) generated Traf1 null mice. Although lymphocyte development was normal, T cells responded to anti-CD3 stimulation with enhanced proliferation. Through TNFR2, but not through TNFR1 (OMIM Ref. No. 191190), they also exhibited enhanced proliferation as well as NFkB (OMIM Ref. No. 164011) and AP1 activation. TNF-induced, lymphocyte-dependent skin necrosis occurred in Traf1 -/- mice at a suboptimal dose of the cytokine. Tsitsikov et al. (2001) concluded that TRAF1 negatively regulates TNFR2-mediated proliferation and NFkB activation

[14903] It is appreciated that the abovementioned animal model for TRAF1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[14904] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [14905] Siemienski, K.; Peters, N.; Scheurich, P.; Wajant, H. : Organization of the human tumour necrosis factor receptor-associated factor 1 (TRAF1) gene and mapping to chromosome 9q33-34. *Gene* 195: 35-39, 1997. ; and
- [14906] Tsitsikov, E. N.; Laouini, D.; Dunn, I. F.; Sannikova, T. Y.; Davidson, L.; Alt, F. W.; Geha, R. S. : TRAF1 is a negative regulator of TNF signaling: enhanced TNF signaling in TRAF1-defi.
- [14907] Further studies establishing the function and utilities of TRAF1 are found in John Hopkins OMIM database record ID 601711, and in cited publications numbered 8862-8865 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA1165 (Accession XM_041162) is another VGAM250 host target gene. KIAA1165 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1165, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1165 BINDING SITE, designated SEQ ID:33477, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:2961.

[14908] Another function of VGAM250 is therefore inhibition of KIAA1165 (Accession XM_041162). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1165. KIAA1822 (Accession XM_041566) is another VGAM250 host target gene. KIAA1822 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1822, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1822 BINDING SITE, designated SEQ ID:33552, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:2961.

[14909] Another function of VGAM250 is therefore inhibition of KIAA1822 (Accession XM_041566). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1822. PRIC285 (Accession XM_028918) is another VGAM250 host target gene. PRIC285 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRIC285, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRIC285 BINDING SITE, designated SEQ ID:30804, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:2961.

[14910] Another function of VGAM250 is therefore inhibition of PRIC285 (Accession XM_028918). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRIC285. LOC146714 (Accession XM_097072) is another VGAM250 host target gene. LOC146714 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146714 BINDING SITE, designated SEQ ID:40721, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:2961.

[14911] Another function of VGAM250 is therefore inhibition of LOC146714 (Accession XM_097072). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC146714. LOC149832 (Accession XM_097733) is another VGAM250 host target gene. LOC149832 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149832, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149832 BINDING SITE, designated SEQ ID:41081, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:2961.

[14912] Another function of VGAM250 is therefore inhibition of LOC149832 (Accession XM_097733). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149832. LOC159110 (Accession XM_088753) is another VGAM250 host target gene. LOC159110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC159110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159110 BINDING SITE, designated SEQ ID:39942, to the nucleotide sequence of VGAM250 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2961.

[14913] Another function of VGAM250 is therefore inhibition of LOC159110 (Accession XM_088753). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159110. LOC159116 (Accession XM_088752) is another VGAM250 host target gene. LOC159116 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC159116, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159116 BINDING SITE, designated SEQ ID:39940, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:2961.

[14914] Another function of VGAM250 is therefore inhibition of LOC159116 (Accession XM_088752). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159116. LOC199958 (Accession XM_117163) is another VGAM250 host target gene. LOC199958 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199958, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199958 BINDING SITE, designated SEQ ID:43264, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:2961.

[14915] Another function of VGAM250 is therefore inhibition of LOC199958 (Accession XM_117163). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199958. LOC205251 (Accession XM_119554) is another VGAM250 host target gene. LOC205251 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC205251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC205251 BINDING SITE, designated SEQ ID:43587, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:2961.

[14916] Another function of VGAM250 is therefore inhibition of LOC205251 (Accession XM_119554). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC205251. LOC220021 (Accession XM_167814) is another VGAM250 host target gene. LOC220021 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220021 BINDING SITE, designated SEQ ID:44852, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:2961.

[14917] Another function of VGAM250 is therefore inhibition of LOC220021 (Accession XM_167814). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220021. LOC254100 (Accession XM_172851) is another VGAM250 host target gene. LOC254100 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254100 BINDING SITE, designated SEQ ID:46128, to

the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:2961.

[14918] Another function of VGAM250 is therefore inhibition of LOC254100 (Accession XM_172851). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254100. LOC56920 (Accession NM_020163) is another VGAM250 host target gene. LOC56920 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC56920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56920 BINDING SITE, designated SEQ ID:21382, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:2961.

[14919] Another function of VGAM250 is therefore inhibition of LOC56920 (Accession NM_020163). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56920. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 251 (VGAM251) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14920] VGAM251 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM251 was detected is described hereinabove with reference to Figs. 1–8.

[14921] VGAM251 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM251 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14922] VGAM251 gene encodes a VGAM251 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM251 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM251 precursor RNA is designated SEQ ID:237, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:237 is located at position 21575 relative to the genome of Callitrichine Herpesvirus 3.

[14923] VGAM251 precursor RNA folds onto itself, forming VGAM251 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14924] An enzyme complex designated DICER COMPLEX, `dices` the VGAM251 folded precursor RNA into VGAM251 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM251 RNA is designated SEQ ID:2962, and is provided hereinbelow with reference to the sequence listing part.

[14925] VGAM251 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM251 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM251 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[14926] VGAM251 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM251 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM251 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM251 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM251 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[14927] The complementary binding of VGAM251 RNA, herein designated VGAM RNA, to host target binding sites on VGAM251 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM251 host target RNA into VGAM251 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14928] It is appreciated that VGAM251 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM251 host target genes. The mRNA of each one of this plurality of VGAM251 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM251 RNA, herein designated VGAM RNA, and which when bound by VGAM251 RNA causes inhibition of translation of respective one or more VGAM251 host target proteins.

[14929] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM251 gene, herein designated VGAM GENE, on one or more VGAM251 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[14930] It is yet further appreciated that a function of VGAM251 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM251 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM251 correlate with, and may be deduced from, the identity of

the host target genes which VGAM251 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14931] Nucleotide sequences of the VGAM251 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM251 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM251 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM251 are further described hereinbelow with reference to Table 1.

[14932] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM251 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM251 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[14933] As mentioned hereinabove with reference to Fig. 1, a function of VGAM251 gene, herein designated VGAM is inhibition of expression of VGAM251 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM251 correlate with, and may be deduced from, the identity of the target genes which VGAM251

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14934] Aldehyde Dehydrogenase 3 Family, Member B2 (ALDH3B2, Accession NM_000695) is a VGAM251 host target gene. ALDH3B2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALDH3B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALDH3B2 BINDING SITE, designated SEQ ID:6358, to the nucleotide sequence of VGAM251 RNA, herein designated VGAM RNA, also designated SEQ ID:2962.

[14935] A function of VGAM251 is therefore inhibition of Aldehyde Dehydrogenase 3 Family, Member B2 (ALDH3B2, Accession NM_000695), a gene which may play a role in alcohol detoxitation. Accordingly, utilities of VGAM251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH3B2. The function of ALDH3B2 has been established by previous studies. See ALDH1 (OMIM Ref. No. 100640). Hsu et al. (1995) and Hsu and Chang (1996) reported the cloning, sequencing and expression of the human ALDH8 gene. Hsu et al. (1997)

determined the structure of the ALDH7 (OMIM Ref. No. 600466) and ALDH8 genes. The ALDH7 gene spans about 20 kb of genomic DNA and contains 9 coding exons. The ALDH8 gene is over 10 kb long and contains at least 10 exons. The ALDH8 gene contains an in-frame stop codon at the seventeenth codon position from the first initiator methionine. The coding region of the ALDH7 gene shows about 86% nucleotide identity with the corresponding region of the ALDH8 gene. The numbers and positions of the introns of the 2 genes are conserved, suggesting that gene duplication is involved in the expansion of the ALDH gene family. The human ALDH7 and ALDH8 genes have a close evolutionary relationship with human ALDH3 (OMIM Ref. No. 100660). The International Radiation Hybrid Mapping Consortium mapped the ALDH8 gene to chromosome 11 (OMIM Ref. No. U37519).

[14936] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14937] Hsu, L. C.; Chang, W.-C. : Sequencing and expression of the human ALDH8 encoding a new member of the aldehyde dehydrogenase family. *Gene* 174: 319-322, 1996. ; and

[14938] Hsu, L. C.; Chang, W.-C.; Lin, S. W.; Yoshida, A. : Cloning and characterization of genes encoding four additional human aldehyde dehydrogenase isozymes. *Adv. Exp. Med. Biol.* 372: 159-1.

[14939] Further studies establishing the function and utilities of ALDH3B2 are found in John Hopkins OMIM database record ID 601917, and in cited publications numbered 9140-914 and 7732 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Enhancer of Zeste Homolog 1 (*Drosophila*) (EZH1, Accession NM_001991) is another VGAM251 host target gene. EZH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EZH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EZH1 BINDING SITE, designated SEQ ID:7715, to the nucleotide sequence of VGAM251 RNA, herein designated VGAM RNA, also designated SEQ ID:2962.

[14940] Another function of VGAM251 is therefore inhibition of Enhancer of Zeste Homolog 1 (*Drosophila*) (EZH1, Accession NM_001991), a gene which may act in transcriptional regulation and heterochromatin maintenance. Accord-

ingly, utilities of VGAM251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EZH1. The function of EZH1 has been established by previous studies. Transcription mapping efforts within chromosome 17q21 identified a human homolog of the *Drosophila* gene 'enhancer of zeste' E(z). In *Drosophila*, the gene acts as a negative regulator of segment identity genes of the Antennapedia and Bithorax complexes. Abel et al. (1996) reported the full-length protein coding sequence of the human homolog, EZH1, and compared the respective protein sequences in human and *Drosophila*. EZH1 encodes a protein of 747 amino acids that displays 55% amino acid identity overall (70% similarity) with the *Drosophila* protein. The strong sequence conservation suggested potential roles for EZH1 in human development as a transcriptional regulator and as a component of protein complexes that stably maintain heterochromatin. EZH1 is expressed as 2 major transcripts in all adult and fetal human tissues surveyed; comparison of cloned cDNAs suggested that alternative splicing may account for at least part of the transcript size differences. Analysis of an EZH1 cDNA revealed an unusual splicing event involving EZH1 and a tandemly linked gene

GPR2 (OMIM Ref. No. 600240) and suggested a potential mechanism for modifying the EZH1 protein in the conserved C-terminal domain. The GPR2 gene maps to 17q21.1–q21.3 in the vicinity of the BRCA1 gene (OMIM Ref. No. 113705). See also EZH2 (OMIM Ref. No. 601573). By FISH, Laible et al. (1999) mapped the mouse Ezh1 gene to chromosome 11.

[14941] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14942] Abel, K. J.; Brody, L. C.; Valdes, J. M.; Erdos, M. R.; McKinley, D. R.; Castilla, L. H.; Merajver, S. D.; Couch, F. J.; Friedman, L. S.; Ostermeyer, E. A.; Lynch, E. D.; King, M.-C.; Welcsh, P. L.; Osborne-Lawrence, S.; Spillman, M.; Bowcock, A. M.; Collins, F. S.; Weber, B. L. : Characterization of EZH1, a human homolog of Drosophila enhancer of zeste near BRCA1. Genomics 37: 161–171, 1996. ; and

[14943] Laible, G.; Haynes, A. R.; Lebersorger, A.; O'Carroll, D.; Mattei, M.-G.; Denny, P.; Brown, S. D. M.; Jenuwein, T. : The murine polycomb-group genes Ezh1 and Ezh2 map close to Hox gene.

[14944] Further studies establishing the function and utilities of EZH1 are found in John Hopkins OMIM database record ID

601674, and in cited publications numbered 9485 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. GATA Binding Protein 2 (GATA2, Accession NM_002050) is another VGAM251 host target gene. GATA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GATA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GATA2 BINDING SITE, designated SEQ ID:7806, to the nucleotide sequence of VGAM251 RNA, herein designated VGAM RNA, also designated SEQ ID:2962.

[14945] Another function of VGAM251 is therefore inhibition of GATA Binding Protein 2 (GATA2, Accession NM_002050). Accordingly, utilities of VGAM251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GATA2. Peptidylprolyl Isomerase F (cyclophilin F) (PPIF, Accession NM_005729) is another VGAM251 host target gene. PPIF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPIF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPIF BINDING SITE, designated SEQ ID:12282, to the nucleotide sequence of VGAM251 RNA, herein designated VGAM RNA, also designated SEQ ID:2962.

[14946] Another function of VGAM251 is therefore inhibition of Peptidylprolyl Isomerase F (cyclophilin F) (PPIF, Accession NM_005729), a gene which catalyzes the cis to trans isomerization of certain proline imidic peptide bonds in oligopeptides. Accordingly, utilities of VGAM251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPIF. The function of PPIF has been established by previous studies. Cyclophilins, also referred to as rotamases, catalyze the cis to trans isomerization of certain proline imidic peptide bonds in oligopeptides, which can be the rate limiting step in the folding of proteins. By screening a human cDNA library with a CyP1 (peptidyl-prolyl isomerase) probe, Bergsma et al. (1991) isolated a novel cDNA, PPIF, which encodes a 207-amino acid protein. Northern blot analysis showed that PPIF, which the authors termed CYP3, is expressed as a major 2-kb transcript in Jurkat cells. RNA slot blot analysis revealed expression of PPIF in most cell lines and

types. Western blot analysis of Jurkat cells separated by differential centrifugation suggested that PPIF is predominantly associated with membranes or organelles. Bowles et al. (1999) characterized the genomic structure of the PPIF gene, which contains 6 exons. On the multigene physical map constructed by Deloukas et al. (1998), the PPIF gene was found to be located in the 10q21–q23 region. By screening BAC libraries for the presence of CEPH markers, Bowles et al. (1999) mapped the PPIF gene between D10S201 and D10S1777 at 10q22–q23. Bowles et al. (1999) studied PPIF as a candidate gene for a form of familial dilated cardiomyopathy (CMD1C; 601493) that maps to 10q21–q23, but found no mutation in the gene as a cause of the disorder.

[14947] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14948] Bowles, K. R.; Zintz, C.; Abraham, S. E.; Brandon, L.; Bowles, N. E.; Towbin, J. A. : Genomic characterization of the human peptidyl–prolyl–cis–trans–isomerase, mitochondrial precursor gene: assessment of its role in familial dilated cardiomyopathy. Hum. Genet. 105: 582–586, 1999. ; and

[14949] Deloukas, P.; Schuler, G. D.; Gyapay, G.; Beasley, E. M.; Soderlund, C.; Rodriguez-Tome, P.; Hui, L.; Matise, T. C.; McKusick, K. B.; Beckmann, J. S.; Bentolila, S.; Bihoreau, M.-T.; an.

[14950] Further studies establishing the function and utilities of PPIF are found in John Hopkins OMIM database record ID 604486, and in cited publications numbered 4749-475 and 12054 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transforming Growth Factor, Beta Receptor III (betaglycan, 300kDa) (TGFB3, Accession NM_003243) is another VGAM251 host target gene. TGFB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGFB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFB3 BINDING SITE, designated SEQ ID:9251, to the nucleotide sequence of VGAM251 RNA, herein designated VGAM RNA, also designated SEQ ID:2962.

[14951] Another function of VGAM251 is therefore inhibition of Transforming Growth Factor, Beta Receptor III (betaglycan, 300kDa) (TGFB3, Accession NM_003243), a gene which

involves in capturing and retaining TGF-beta for presentation to the signaling receptors. Accordingly, utilities of VGAM251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFBR3. The function of TGFBR3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM139. Apolipoprotein L, 2 (APOL2, Accession NM_030882) is another VGAM251 host target gene. APOL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APOL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOL2 BINDING SITE, designated SEQ ID:25160, to the nucleotide sequence of VGAM251 RNA, herein designated VGAM RNA, also designated SEQ ID:2962.

[14952] Another function of VGAM251 is therefore inhibition of Apolipoprotein L, 2 (APOL2, Accession NM_030882). Accordingly, utilities of VGAM251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOL2. Calneuron 1 (CALN1, Accession

NM_031468) is another VGAM251 host target gene. CALN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CALN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALN1 BINDING SITE, designated SEQ ID:25511, to the nucleotide sequence of VGAM251 RNA, herein designated VGAM RNA, also designated SEQ ID:2962.

[14953] Another function of VGAM251 is therefore inhibition of Calneuron 1 (CALN1, Accession NM_031468). Accordingly, utilities of VGAM251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALN1. DKFZP434E2135 (Accession NM_030804) is another VGAM251 host target gene. DKFZP434E2135 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434E2135, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434E2135 BINDING SITE, designated SEQ ID:25111, to the nucleotide sequence of

VGAM251 RNA, herein designated VGAM RNA, also designated SEQ ID:2962.

[14954] Another function of VGAM251 is therefore inhibition of DKFZP434E2135 (Accession NM_030804). Accordingly, utilities of VGAM251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434E2135. DKFZP586F1524 (Accession NM_015584) is another VGAM251 host target gene. DKFZP586F1524 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP586F1524, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586F1524 BINDING SITE, designated SEQ ID:17852, to the nucleotide sequence of VGAM251 RNA, herein designated VGAM RNA, also designated SEQ ID:2962.

[14955] Another function of VGAM251 is therefore inhibition of DKFZP586F1524 (Accession NM_015584). Accordingly, utilities of VGAM251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586F1524. FLJ10853 (Accession NM_018246) is another VGAM251 host target gene. FLJ10853 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10853, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10853 BINDING SITE, designated SEQ ID:20216, to the nucleotide sequence of VGAM251 RNA, herein designated VGAM RNA, also designated SEQ ID:2962.

[14956] Another function of VGAM251 is therefore inhibition of FLJ10853 (Accession NM_018246). Accordingly, utilities of VGAM251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10853. FLJ23071 (Accession NM_025192) is another VGAM251 host target gene. FLJ23071 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23071 BINDING SITE, designated SEQ ID:24848, to the nucleotide sequence of VGAM251 RNA, herein designated VGAM RNA, also designated SEQ ID:2962.

[14957] Another function of VGAM251 is therefore inhibition of

FLJ23071 (Accession NM_025192). Accordingly, utilities of VGAM251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23071. KIAA0261 (Accession XM_042946) is another VGAM251 host target gene. KIAA0261 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0261, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0261 BINDING SITE, designated SEQ ID:33835, to the nucleotide sequence of VGAM251 RNA, herein designated VGAM RNA, also designated SEQ ID:2962.

[14958] Another function of VGAM251 is therefore inhibition of KIAA0261 (Accession XM_042946). Accordingly, utilities of VGAM251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0261. MGC2306 (Accession NM_032638) is another VGAM251 host target gene. MGC2306 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2306, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of MGC2306 BINDING SITE, designated SEQ ID:26356, to the nucleotide sequence of VGAM251 RNA, herein designated VGAM RNA, also designated SEQ ID:2962.

[14959] Another function of VGAM251 is therefore inhibition of MGC2306 (Accession NM_032638). Accordingly, utilities of VGAM251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2306. Zinc Finger Protein, Subfamily 1A, 2 (Helios) (ZNFN1A2, Accession NM_016260) is another VGAM251 host target gene. ZNFN1A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNFN1A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNFN1A2 BINDING SITE, designated SEQ ID:18389, to the nucleotide sequence of VGAM251 RNA, herein designated VGAM RNA, also designated SEQ ID:2962.

[14960] Another function of VGAM251 is therefore inhibition of Zinc Finger Protein, Subfamily 1A, 2 (Helios) (ZNFN1A2, Accession NM_016260). Accordingly, utilities of VGAM251 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with ZNFN1A2.

LOC149603 (Accession XM_047499) is another VGAM251 host target gene. LOC149603 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149603, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149603 BINDING SITE, designated SEQ ID:34969, to the nucleotide sequence of VGAM251 RNA, herein designated VGAM RNA, also designated SEQ ID:2962.

[14961] Another function of VGAM251 is therefore inhibition of LOC149603 (Accession XM_047499). Accordingly, utilities of VGAM251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149603. LOC221466 (Accession XM_168087) is another VGAM251 host target gene. LOC221466 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221466 BINDING SITE, designated SEQ ID:44991, to

the nucleotide sequence of VGAM251 RNA, herein designated VGAM RNA, also designated SEQ ID:2962.

[14962] Another function of VGAM251 is therefore inhibition of LOC221466 (Accession XM_168087). Accordingly, utilities of VGAM251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221466. LOC91380 (Accession XM_038134) is another VGAM251 host target gene. LOC91380 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91380, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91380 BINDING SITE, designated SEQ ID:32754, to the nucleotide sequence of VGAM251 RNA, herein designated VGAM RNA, also designated SEQ ID:2962.

[14963] Another function of VGAM251 is therefore inhibition of LOC91380 (Accession XM_038134). Accordingly, utilities of VGAM251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91380. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 252 (VGAM252) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14964] VGAM252 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM252 was detected is described hereinabove with reference to Figs. 1–8.

[14965] VGAM252 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM252 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14966] VGAM252 gene encodes a VGAM252 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM252 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM252 precursor RNA is designated SEQ ID:238, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:238 is located at position 138077 relative to the genome of Callitrichine Herpesvirus 3.

[14967] VGAM252 precursor RNA folds onto itself, forming VGAM252 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14968] An enzyme complex designated DICER COMPLEX, `dices` the VGAM252 folded precursor RNA into VGAM252 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM252 RNA is designated SEQ ID:2963, and is provided hereinbelow with reference to the sequence listing part.

[14969] VGAM252 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM252 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM252 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[14970] VGAM252 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM252 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM252 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM252 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM252 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[14971] The complementary binding of VGAM252 RNA, herein designated VGAM RNA, to host target binding sites on VGAM252 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM252 host target RNA into VGAM252 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14972] It is appreciated that VGAM252 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM252 host target genes. The mRNA of each one of this plurality of VGAM252 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM252 RNA, herein designated VGAM RNA, and which when bound by VGAM252 RNA causes inhibition of translation of respective one or more VGAM252 host target proteins.

[14973] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM252 gene, herein designated VGAM GENE, on one or more VGAM252 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[14974] It is yet further appreciated that a function of VGAM252 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM252 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM252 correlate with, and may be deduced from, the identity of

the host target genes which VGAM252 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [14975] Nucleotide sequences of the VGAM252 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM252 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM252 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM252 are further described hereinbelow with reference to Table 1.
- [14976] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM252 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM252 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [14977] As mentioned hereinabove with reference to Fig. 1, a function of VGAM252 gene, herein designated VGAM is inhibition of expression of VGAM252 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM252 correlate with, and may be deduced from, the identity of the target genes which VGAM252

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[14978] Kinesin-like 1 (KNSL1, Accession NM_004523) is a VGAM252 host target gene. KNSL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KNSL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KNSL1 BINDING SITE, designated SEQ ID:10861, to the nucleotide sequence of VGAM252 RNA, herein designated VGAM RNA, also designated SEQ ID:2963.

[14979] A function of VGAM252 is therefore inhibition of Kinesin-like 1 (KNSL1, Accession NM_004523), a gene which is a motor protein required for establishing a bipolar spindle. Accordingly, utilities of VGAM252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KNSL1. The function of KNSL1 has been established by previous studies. Kinesins are tubulin (see OMIM Ref. No. 191130) molecular motors that function to transport organelles within cells and to move chromosomes along microtubules during cell division. In sea urchin and mammalian cells, kinesins have been charac-

terized as tetrameric proteins comprising 2 heavy chains (alpha chains) of approximately 120 kD and 2 light chains (beta chains) of approximately 70 kD. The alpha chains provide the tubulin binding site and the ATPase domains, whereas the beta chains are responsible for the specific attachment of the organelle to be moved by the kinesin tetramer. Kinesins transport their bound organelle to the plus end of the microtubule. Chernajovsky et al., (1996) noted that differential splicing occurs for the kinesin beta (light) cDNA sequences at the 3-prime end of the rat kinesin mRNA, producing kinesins having different C-terminal ends that seem to confer the kinesin specificity for organelle binding. Cabeza-Arvelaiz et al. (1993) isolated and sequenced a cDNA encoding the human kinesin light chain protein (KLC). The cDNA consists of 276 nucleotides of 5-prime untranslated region, a coding sequence of 1,710 nucleotides, and 322 nucleotides of 3-prime untranslated region. It encodes a polypeptide of 569 amino acids and a deduced molecular mass of 64,789 daltons. The predicted secondary internal structure of the KLC molecule consists of about 27 contiguous repeats, each of approximately 21 amino acids, and could be divided into 3 domains. See also 601334 Chernajovsky et al.

(1996) characterized the human KNS2 gene product of a differentially spliced, T-cell-derived mRNA and cloned its promoter region. The promoter region transcribes constitutively. In permanently transfected human HeLa and NB100 neuroblastoma cells, a reporter gene containing the promoter and part of the first exon of beta kinesin was 75-fold more active than the HSV-tk promoter. The first exon contains a 5-prime untranslated sequence capable of forming a stable double-hairpin loop, which functions as a translational enhancer. Its deletion decreases the efficiency of in vitro translation of beta kinesin mRNA. Kamal et al. (2000) demonstrated that the axonal transport of APP (OMIM Ref. No. 104760) in neurons is mediated by the direct binding of APP to the kinesin light chain subunit of kinesin-I.

[14980] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[14981] Goedert, M.; Marsh, S.; Carter, N. : Localization of the human kinesin light chain gene (KNS2) to chromosome 14q32.3 by fluorescence in situ hybridization. Genomics 32: 173-175, 1996. ; and

[14982] Kamal, A.; Stokin, G. B.; Yang, Z.; Xia, C.; Goldstein, L. S. :

Axonal transport of amyloid precursor protein is mediated by direct binding to the kinesin light chain subunit of kinesin-.

[14983] Further studies establishing the function and utilities of KNSL1 are found in John Hopkins OMIM database record ID 148760, and in cited publications numbered 319 and 12000-3225 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM_003671) is another VGAM252 host target gene. CDC14B BINDING SITE1 and CDC14B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CDC14B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC14B BINDING SITE1 and CDC14B BINDING SITE2, designated SEQ ID:9758 and SEQ ID:27162 respectively, to the nucleotide sequence of VGAM252 RNA, herein designated VGAM RNA, also designated SEQ ID:2963.

[14984] Another function of VGAM252 is therefore inhibition of CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*)

(CDC14B, Accession NM_003671). Accordingly, utilities of VGAM252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14B. FLJ11164 (Accession NM_018346) is another VGAM252 host target gene. FLJ11164 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11164 BINDING SITE, designated SEQ ID:20355, to the nucleotide sequence of VGAM252 RNA, herein designated VGAM RNA, also designated SEQ ID:2963.

[14985] Another function of VGAM252 is therefore inhibition of FLJ11164 (Accession NM_018346). Accordingly, utilities of VGAM252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11164. Rho-related BTB Domain Containing 2 (RHOBTB2, Accession XM_027679) is another VGAM252 host target gene. RHOBTB2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RHOBTB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of RHOBTB2 BINDING SITE, designated SEQ ID:30559, to the nucleotide sequence of VGAM252 RNA, herein designated VGAM RNA, also designated SEQ ID:2963.

[14986] Another function of VGAM252 is therefore inhibition of Rho-related BTB Domain Containing 2 (RHOBTB2, Accession XM_027679). Accordingly, utilities of VGAM252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHOBTB2. LOC150577 (Accession XM_097918) is another VGAM252 host target gene. LOC150577 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150577 BINDING SITE, designated SEQ ID:41218, to the nucleotide sequence of VGAM252 RNA, herein designated VGAM RNA, also designated SEQ ID:2963.

[14987] Another function of VGAM252 is therefore inhibition of LOC150577 (Accession XM_097918). Accordingly, utilities of VGAM252 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC150577. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 253 (VGAM253) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[14988] VGAM253 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM253 was detected is described hereinabove with reference to Figs. 1–8.

[14989] VGAM253 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM253 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[14990] VGAM253 gene encodes a VGAM253 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM253 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM253 precursor RNA is designated SEQ

ID:239, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:239 is located at position 58790 relative to the genome of Calitrichine Herpesvirus 3.

[14991] VGAM253 precursor RNA folds onto itself, forming VGAM253 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[14992] An enzyme complex designated DICER COMPLEX, `dices` the VGAM253 folded precursor RNA into VGAM253 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM253 RNA is designated SEQ ID:2964, and is provided hereinbelow with reference to the sequence

listing part.

[14993] VGAM253 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM253 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM253 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[14994] VGAM253 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM253 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM253 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM253 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM253 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[14995] The complementary binding of VGAM253 RNA, herein designated VGAM RNA, to host target binding sites on VGAM253 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM253 host target RNA into VGAM253 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[14996] It is appreciated that VGAM253 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM253 host target genes. The mRNA of each one of this plurality of VGAM253 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM253 RNA, herein designated VGAM

RNA, and which when bound by VGAM253 RNA causes inhibition of translation of respective one or more VGAM253 host target proteins.

[14997] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM253 gene, herein designated VGAM GENE, on one or more VGAM253 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[14998] It is yet further appreciated that a function of VGAM253 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM253 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM253 correlate with, and may be deduced from, the identity of the host target genes which VGAM253 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[14999] Nucleotide sequences of the VGAM253 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM253 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM253 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM253 are further described hereinbelow with reference to Table 1.

[15000] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM253 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM253 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15001] As mentioned hereinabove with reference to Fig. 1, a function of VGAM253 gene, herein designated VGAM is

inhibition of expression of VGAM253 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM253 correlate with, and may be deduced from, the identity of the target genes which VGAM253 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15002] Calumenin (CALU, Accession NM_001219) is a VGAM253 host target gene. CALU BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALU BINDING SITE, designated SEQ ID:6885, to the nucleotide sequence of VGAM253 RNA, herein designated VGAM RNA, also designated SEQ ID:2964.

[15003] A function of VGAM253 is therefore inhibition of Calumenin (CALU, Accession NM_001219), a gene which binds 7 calcium ions with a low affinity with unidentified function. Accordingly, utilities of VGAM253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALU. The function of CALU has been established by previous studies. Many calcium-binding pro-

teins are reported to be localized in the endoplasmic reticulum (ER) and involved in such ER functions as protein folding and sorting. Among these are RCN1 (OMIM Ref. No. 602735), RCN2 (OMIM Ref. No. 602584), and calumenin (CALU), which form a novel family of calcium-binding proteins in the ER and Golgi apparatus. By searching sequence databases with a mouse Calu cDNA sequence (Yabe et al., 1997), Yabe et al. (1998) identified a human CALU EST, which they used to clone a full-length CALU cDNA. The cDNA encodes a deduced 315-amino acid protein containing 6 EF-hand motifs, 1 potential N-glycosylation site, and a C-terminal ER retention signal. The human and mouse CALU proteins are 98% identical. Northern blot analysis demonstrated that the 3.4-kb CALU mRNA is ubiquitously expressed in human tissues. Southern blot analysis using a human CALU cDNA probe detected bands in a variety of species. Yabe et al. (1997) mapped the mouse Calu gene to the proximal portion of chromosome 7. By fluorescence in situ hybridization, Yabe et al. (1998) localized the human CALU gene to 7q32, which was an unexpected result due to the homology of synteny between proximal mouse chromosome 7 and human 19q13.2–q13.3.

- [15004] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [15005] Yabe, D.; Nakamura, T.; Kanazawa, N.; Tashiro, K.; Honjo, T. : Calumenin, a $\text{Ca}(2+)$ -binding protein retained in the endoplasmic reticulum with a novel carboxyl-terminal sequence, HDEF. J. Biol. Chem. 272: 18232–18239, 1997. ; and
- [15006] Yabe, D.; Taniwaki, M.; Nakamura, T.; Kanazawa, N.; Tashiro, K.; Honjo, T. : Human calumenin gene (CALU): cDNA isolation and chromosomal mapping to 7q32. Genomics 49: 331–333, 1998.
- [15007] Further studies establishing the function and utilities of CALU are found in John Hopkins OMIM database record ID 603420, and in cited publications numbered 8186–8187 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Egl Nine Homolog 1 (C. elegans) (EGLN1, Accession NM_022051) is another VGAM253 host target gene. EGLN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EGLN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of EGLN1 BINDING SITE, designated SEQ ID:22585, to the nucleotide sequence of VGAM253 RNA, herein designated VGAM RNA, also designated SEQ ID:2964.

[15008] Another function of VGAM253 is therefore inhibition of Egl Nine Homolog 1 (*C. elegans*) (EGLN1, Accession NM_022051), a gene which is expressed in the cytoplasm of arterial smooth muscle cells. Accordingly, utilities of VGAM253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGLN1. The function of EGLN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM216.FLJ11155 (Accession NM_018342) is another VGAM253 host target gene. FLJ11155 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ11155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11155 BINDING SITE, designated SEQ ID:20348, to the nucleotide sequence of VGAM253 RNA, herein designated VGAM RNA, also designated SEQ ID:2964.

[15009] Another function of VGAM253 is therefore inhibition of FLJ11155 (Accession NM_018342). Accordingly, utilities of VGAM253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11155. FLJ12697 (Accession XM_166526) is another VGAM253 host target gene. FLJ12697 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12697, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12697 BINDING SITE, designated SEQ ID:44473, to the nucleotide sequence of VGAM253 RNA, herein designated VGAM RNA, also designated SEQ ID:2964.

[15010] Another function of VGAM253 is therefore inhibition of FLJ12697 (Accession XM_166526). Accordingly, utilities of VGAM253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12697. KIAA1023 (Accession NM_017604) is another VGAM253 host target gene. KIAA1023 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1023, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1023 BINDING SITE, designated SEQ ID:19091, to the nucleotide sequence of VGAM253 RNA, herein designated VGAM RNA, also designated SEQ ID:2964.

[15011] Another function of VGAM253 is therefore inhibition of KIAA1023 (Accession NM_017604). Accordingly, utilities of VGAM253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1023. KIAA1941 (Accession XM_059318) is another VGAM253 host target gene. KIAA1941 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1941, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1941 BINDING SITE, designated SEQ ID:36952, to the nucleotide sequence of VGAM253 RNA, herein designated VGAM RNA, also designated SEQ ID:2964.

[15012] Another function of VGAM253 is therefore inhibition of KIAA1941 (Accession XM_059318). Accordingly, utilities of VGAM253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1941. LOC149912 (Accession XM_097743) is another VGAM253 host target gene. LOC149912 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149912 BINDING SITE, designated SEQ ID:41087, to the nucleotide sequence of VGAM253 RNA, herein designated VGAM RNA, also designated SEQ ID:2964.

[15013] Another function of VGAM253 is therefore inhibition of LOC149912 (Accession XM_097743). Accordingly, utilities of VGAM253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149912. LOC155179 (Accession XM_088169) is another VGAM253 host target gene. LOC155179 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155179 BINDING SITE, designated SEQ ID:39558, to the nucleotide sequence of VGAM253 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2964.

[15014] Another function of VGAM253 is therefore inhibition of LOC155179 (Accession XM_088169). Accordingly, utilities of VGAM253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155179. LOC199958 (Accession XM_117163) is another VGAM253 host target gene. LOC199958 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199958 BINDING SITE, designated SEQ ID:43266, to the nucleotide sequence of VGAM253 RNA, herein designated VGAM RNA, also designated SEQ ID:2964.

[15015] Another function of VGAM253 is therefore inhibition of LOC199958 (Accession XM_117163). Accordingly, utilities of VGAM253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199958. LOC219731 (Accession XM_167596) is another VGAM253 host target gene. LOC219731 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219731, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219731 BINDING SITE, designated SEQ ID:44718, to the nucleotide sequence of VGAM253 RNA, herein designated VGAM RNA, also designated SEQ ID:2964.

[15016] Another function of VGAM253 is therefore inhibition of LOC219731 (Accession XM_167596). Accordingly, utilities of VGAM253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219731. LOC254735 (Accession XM_171051) is another VGAM253 host target gene. LOC254735 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254735, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254735 BINDING SITE, designated SEQ ID:45838, to the nucleotide sequence of VGAM253 RNA, herein designated VGAM RNA, also designated SEQ ID:2964.

[15017] Another function of VGAM253 is therefore inhibition of LOC254735 (Accession XM_171051). Accordingly, utilities of VGAM253 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC254735. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 254 (VGAM254) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15018] VGAM254 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM254 was detected is described hereinabove with reference to Figs. 1–8.

[15019] VGAM254 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM254 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15020] VGAM254 gene encodes a VGAM254 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM254 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM254 precursor RNA is designated SEQ

ID:240, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:240 is located at position 17777 relative to the genome of Calitrichine Herpesvirus 3.

[15021] VGAM254 precursor RNA folds onto itself, forming VGAM254 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15022] An enzyme complex designated DICER COMPLEX, `dices` the VGAM254 folded precursor RNA into VGAM254 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM254 RNA is designated SEQ ID:2965, and is provided hereinbelow with reference to the sequence

listing part.

[15023] VGAM254 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM254 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM254 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15024] VGAM254 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM254 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM254 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM254 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM254 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15025] The complementary binding of VGAM254 RNA, herein designated VGAM RNA, to host target binding sites on VGAM254 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM254 host target RNA into VGAM254 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15026] It is appreciated that VGAM254 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM254 host target genes. The mRNA of each one of this plurality of VGAM254 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM254 RNA, herein designated VGAM

RNA, and which when bound by VGAM254 RNA causes inhibition of translation of respective one or more VGAM254 host target proteins.

[15027] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM254 gene, herein designated VGAM GENE, on one or more VGAM254 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15028] It is yet further appreciated that a function of VGAM254 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM254 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM254 correlate with, and may be deduced from, the identity of the host target genes which VGAM254 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15029] Nucleotide sequences of the VGAM254 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM254 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM254 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM254 are further described hereinbelow with reference to Table 1.

[15030] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM254 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM254 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15031] As mentioned hereinabove with reference to Fig. 1, a function of VGAM254 gene, herein designated VGAM is

inhibition of expression of VGAM254 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM254 correlate with, and may be deduced from, the identity of the target genes which VGAM254 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15032] Fibrillin 2 (congenital contractural arachnodactyly) (FBN2, Accession NM_001999) is a VGAM254 host target gene. FBN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBN2 BINDING SITE, designated SEQ ID:7725, to the nucleotide sequence of VGAM254 RNA, herein designated VGAM RNA, also designated SEQ ID:2965.

[15033] A function of VGAM254 is therefore inhibition of Fibrillin 2 (congenital contractural arachnodactyly) (FBN2, Accession NM_001999), a gene which structural component of connective tissue microfibrils that binds calcium. fibrillin-2-containing microfibrils regulate the early process of elastic fiber assembly. Accordingly, utilities of VGAM254 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with FBN2. The function of FBN2 has been established by previous studies. Beals and Hecht (1971) described father and 2 sons affected in 1 kindred and father, daughter and son (by different mothers) affected in a second kindred. They proposed that the disorder be called 'contractural arachnodactyly' and further suggested that the patient reported by Marfan (1896) had this disorder rather than the Marfan syndrome (OMIM Ref. No. 154700) as presently delineated (Hecht and Beals, 1972). They found several other reports, apparently of the same disorder. Beyer et al. (1965) probably described the same condition in a mother and 4 children and some of the reports of combined Marfan syndrome and arthrogryposis multiplex congenita may be further examples (e.g., Reeve et al., 1960; Kingsley-Pillers, 1946). Epstein et al. (1968) described father and son with a connective tissue disorder with some features suggesting the Marfan syndrome and some suggesting osteogenesis imperfecta. Severe kyphoscoliosis, generalized osteopenia, flexion contractures of the fingers and abnormally shaped ears were among the characteristics. Abnormally shaped ('crumpled') ears have been emphasized by other students of CCA. According to Mirise and Shear (1979), the ocular

and cardiovascular complications of the Marfan syndrome do not occur in contractural arachnodactyly (Mirise and Shear, 1979). Hence, the correct diagnosis has prognostic significance. Park et al. (1998) identified FBN2 mutations in 6 of 12 unrelated CCA patient cell strains. All of the identified mutations were clustered in a limited region of the gene, a region corresponding to that in FBN1 where mutations produce the severe, congenital form of Marfan syndrome, so-called neonatal Marfan syndrome. Furthermore, 3 of the identified mutations occurred in the FBN2 locations exactly corresponding to FBN1 mutations that had been reported in cases of neonatal Marfan syndrome. These mutations indicate that this central region of both fibrillins plays a critical role in human embryogenesis. The limited region of FBN2 that can be mutated to cause CCA may also help explain the rarity of CCA compared to Marfan syndrome. Belleh et al. (2000) reported 2 additional FBN2 mutations in CCA: C1141F in exon 26 (121050.0008) and C1252W in exon 29 (121050.0009). As in previous cases, mutations clustered in the region of fibrillin-2 homologous to the so-called neonatal Marfan syndrome region of fibrillin-1 (FBN1; 134797) (Kainulainen et al., 1994). Gupta et al. (2002) noted that

all of the identified CCA mutations in FBN2 cluster in a limited region similar to that where severe Marfan syndrome mutations cluster in FBN1, specifically between exons 23 and 34. Gupta et al. (2002) screened exons 22 through 36 of FBN2 for mutations in 13 patients with classic CCA by single-stranded conformation polymorphism analysis followed by direct sequencing. They successfully identified 10 novel mutations in this critical region of FBN2 in these patients, indicating a mutation detection rate of 75% in this region. None of these identified FBN2 mutations alter amino acids in the calcium-binding consensus sequence in the EGF-like domains, whereas many of the FBN1 mutations alter the consensus sequence. Gupta et al. (2002) reviewed the 21 known CAA mutations in the FBN2 gene, along with available clinical information on the probands. They found that 3 of the 21 patients had dilatation of the aortic root. All 3 were young, and the degree of dilatation appeared to have been borderline in all. However, because of the lack of knowledge of the natural history of aortic involvement in CCA, Gupta et al. (2002) recommended that all CCA patients have an echocardiogram. They cited Su et al. (2000) as indicating that approximately 15% of CCA patients have

congenital heart defects. Their review did not support this conclusion, instead suggesting that congenital heart defects are only an occasional finding in these patients. Animal model experiments lend further support to the function of FBN2. Chaudhry et al. (2001) analyzed the classic mouse mutant 'Shaker-with-syndactylism' (sy) using a positional candidate approach. The authors demonstrated that several loss-of-function mutations, each located outside the 'neonatal region' of Fbn2, caused syndactyly in mice, rather than CCA as in man. The deafness in these animals is caused by mutations in the contiguous Na-K-2Cl cotransporter gene Slc12a2 (OMIM Ref. No. 600840) (Dixon et al., 1999).

[15034] It is appreciated that the abovementioned animal model for FBN2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[15035] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15036] Gupta, P. A.; Putnam, E. A.; Carmical, S. G.; Kaitila, I.; Steinmann, B.; Child, A.; Danesino, C.; Metcalfe, K.; Berry, S. A.; Chen, E.; Delorme, C. V.; Thong, M.-K.; Ades, L. C.;

Milewicz, D. M. : Ten novel FBN2 mutations in congenital contractural arachnodactyly: delineation of the molecular pathogenesis and clinical phenotype. Hum. Mutat. 19: 39–48, 2002. ; and

[15037] Su, P.–H.; Hou, J.–W.; Hwu, W.–L.; Wu, M.–H.; Wang, J.–K.; Wang, T.–R. : Congenital contractural arachnodactyly (Beals syndrome). Acta Paediat. 41: 59–62, 2000.

[15038] Further studies establishing the function and utilities of FBN2 are found in John Hopkins OMIM database record ID 121050, and in cited publications numbered 148–149, 298–309, 313, 314–312, 315–330, 38 and 4654–4661 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Juncctophilin 3 (JPH3, Accession NM_020655) is another VGAM254 host target gene. JPH3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by JPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JPH3 BINDING SITE, designated SEQ ID:21827, to the nucleotide sequence of VGAM254 RNA, herein designated VGAM RNA, also designated SEQ ID:2965.

[15039] Another function of VGAM254 is therefore inhibition of Junctophilin 3 (JPH3, Accession NM_020655), a gene which is involved in cytoskeletal organization and cellular growth. Accordingly, utilities of VGAM254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JPH3. The function of JPH3 has been established by previous studies. Junctional complexes between the plasma membrane (PM) and endoplasmic/sarcoplasmic reticulum (ER/SR) are a common feature of all excitable cell types and mediate cross talk between cell surface and intracellular ion channels. Takeshima et al. (2000) identified the junctophilins (JPs), a conserved family of proteins that are components of the junctional complexes. JPs are composed of a C-terminal hydrophobic segment spanning the ER/SR membrane and a remaining cytoplasmic domain that shows specific affinity for the PM. In mouse, there are at least 3 JP subtypes: Jp1, Jp2, and Jp3 Margolis et al. (2001) described a disorder termed Huntington disease-like 2 (HDL2; 606438) segregating in an autosomal dominant pattern in a large pedigree with an unidentified CAG/CTG expansion. Holmes et al. (2001) reported the cloning of this expansion and its localization to a variably spliced exon of JPH3, a gene involved in the

formation of junctional membrane structures. They stated the location of the gene as 16q24.3. All 10 affected individuals tested had a repeat expansion, ranging in size from 51 to 57 triplets, whereas 3 unaffected individuals had 2 unexpanded alleles. The variability of the length of the expanded repeat among sibs from 3 different sibships indicated that the expanded allele is unstable in vertical transmission. There was no apparent correlation between repeat size and age of onset, but the range of repeat length among family members was narrow. The index family was African-American; Holmes et al. (2001) detected HDL2-related repeat expansions in 4 African-American individuals from the southeastern United States, each of whom had a familial Huntington disease-like disorder and had tested negative for the Huntington disease mutation. They demonstrated that the CTG repeat is localized 760 nucleotides 3-prime to the end of exon 1. At least 4 lines of evidence suggested that the CTG repeat is contained within an alternatively spliced exon (termed 2A) of the JPH3 gene that has multiple splice acceptor sites.

[15040] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [15041] Holmes, S. E.; O'Hearn, E.; Rosenblatt, A.; Callahan, C.; Hwang, H. S.; Ingersoll-Ashworth, R. G.; Fleisher, A.; Stevanin, G.; Brice, A.; Potter, N. T.; Ross, C. A.; Margolis, R. L. : A repeat expansion in the gene encoding junctophilin-3 is associated with Huntington disease-like 2. *Nature Genet.* 29: 377-378, 2001. Note: Erratum: *Nature Genet.* 30: 123 only, 2002. ; and
- [15042] Margolis, R. L.; O'Hearn, E.; Rosenblatt, A.; Willour, V.; Holmes, S. E.; Franz, M. L.; Callahan, C.; Hwang, H. S.; Troncoso, J. C.; Ross, C. A. : A disorder similar to Huntington's dis.
- [15043] Further studies establishing the function and utilities of JPH3 are found in John Hopkins OMIM database record ID 605268, and in cited publications numbered 503 and 5036-5037 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LOC145371 (Accession XM_085123) is another VGAM254 host target gene. LOC145371 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC145371 BINDING SITE, designated SEQ ID:37843, to the nucleotide sequence of VGAM254 RNA, herein designated VGAM RNA, also designated SEQ ID:2965.

[15044] Another function of VGAM254 is therefore inhibition of LOC145371 (Accession XM_085123). Accordingly, utilities of VGAM254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145371. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 255 (VGAM255) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15045] VGAM255 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM255 was detected is described hereinabove with reference to Figs. 1–8.

[15046] VGAM255 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM255 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15047] VGAM255 gene encodes a VGAM255 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM255 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM255 precursor RNA is designated SEQ ID:241, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:241 is located at position 113673 relative to the genome of Calitrichine Herpesvirus 3.

[15048] VGAM255 precursor RNA folds onto itself, forming VGAM255 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15049] An enzyme complex designated DICER COMPLEX, `dices` the VGAM255 folded precursor RNA into VGAM255 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM255 RNA is designated SEQ ID:2966, and is provided hereinbelow with reference to the sequence listing part.

[15050] VGAM255 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM255 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM255 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[15051] VGAM255 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM255 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM255 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM255 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM255 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[15052] The complementary binding of VGAM255 RNA, herein designated VGAM RNA, to host target binding sites on VGAM255 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM255 host target RNA into VGAM255 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15053] It is appreciated that VGAM255 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM255 host target genes. The mRNA of each one of this plurality of VGAM255 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM255 RNA, herein designated VGAM RNA, and which when bound by VGAM255 RNA causes inhibition of translation of respective one or more VGAM255 host target proteins.

[15054] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM255 gene, herein designated VGAM GENE, on one or more VGAM255 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[15055] It is yet further appreciated that a function of VGAM255 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM255 correlate with, and may be deduced from, the identity of the host target genes which VGAM255 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15056] Nucleotide sequences of the VGAM255 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM255 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM255 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM255 are further described hereinbelow with reference to Table 1.

[15057] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM255 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM255 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15058] As mentioned hereinabove with reference to Fig. 1, a function of VGAM255 gene, herein designated VGAM is inhibition of expression of VGAM255 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM255 correlate with, and may be deduced from, the identity of the target genes which VGAM255 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15059] UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 6 (B4GALT6, Accession XM_008799) is a VGAM255 host target gene. B4GALT6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B4GALT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT6 BINDING SITE, designated SEQ ID:30095, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:2966.

[15060] A function of VGAM255 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 6 (B4GALT6, Accession XM_008799). Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT6. Chemokine (C-C motif) Receptor 2 (CCR2, Accession NM_000648) is another VGAM255 host target gene. CCR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR2 BINDING SITE, designated SEQ ID:6312, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:2966.

[15061] Another function of VGAM255 is therefore inhibition of Chemokine (C-C motif) Receptor 2 (CCR2, Accession NM_000648), a gene which binds chemokines and transduces a signal by increasing the intracellular calcium ions level. Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR2. The function of CCR2 and its association with various diseases and clinical conditions,

has been established by previous studies, as described hereinabove with reference to VGAM206. Kruppel-like Factor 5 (intestinal) (KLF5, Accession NM_001730) is another VGAM255 host target gene. KLF5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLF5 BINDING SITE, designated SEQ ID:7463, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:2966.

[15062] Another function of VGAM255 is therefore inhibition of Kruppel-like Factor 5 (intestinal) (KLF5, Accession NM_001730). Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLF5. N-acetylated Alpha-linked Acidic Dipeptidase 2 (NAALAD2, Accession NM_005467) is another VGAM255 host target gene. NAALAD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NAALAD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of NAALAD2 BINDING SITE, designated SEQ ID:11963, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:2966.

[15063] Another function of VGAM255 is therefore inhibition of N-acetylated Alpha-linked Acidic Dipeptidase 2 (NAALAD2, Accession NM_005467). Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAALAD2. Progesterone Receptor Membrane Component 2 (PGRMC2, Accession NM_006320) is another VGAM255 host target gene. PGRMC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PGRMC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PGRMC2 BINDING SITE, designated SEQ ID:13012, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:2966.

[15064] Another function of VGAM255 is therefore inhibition of Progesterone Receptor Membrane Component 2 (PGRMC2,

Accession NM_006320). Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PGRMC2.

LOC92270 (Accession XM_043989) is another VGAM255 host target gene. LOC92270 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92270, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92270 BINDING SITE, designated SEQ ID:34061, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:2966.

[15065] Another function of VGAM255 is therefore inhibition of LOC92270 (Accession XM_043989). Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92270. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 256 (VGAM256) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[15066] VGAM256 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM256 was detected is described hereinabove with reference to Figs. 1–8.

[15067] VGAM256 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM256 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15068] VGAM256 gene encodes a VGAM256 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM256 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM256 precursor RNA is designated SEQ ID:242, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:242 is located at position 43629 relative to the genome of Callitrichine Herpesvirus 3.

[15069] VGAM256 precursor RNA folds onto itself, forming VGAM256 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[15070] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM256 folded precursor RNA into VGAM256 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 70%) nucleotide se-
quence of VGAM256 RNA is designated SEQ ID:2967, and
is provided hereinbelow with reference to the sequence
listing part.

[15071] VGAM256 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM256 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM256 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[15072] VGAM256 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM256 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM256 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM256 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM256 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[15073] The complementary binding of VGAM256 RNA, herein designated VGAM RNA, to host target binding sites on VGAM256 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM256 host target RNA into VGAM256 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15074] It is appreciated that VGAM256 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM256 host target genes. The mRNA of each one of this plurality of VGAM256 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM256 RNA, herein designated VGAM RNA, and which when bound by VGAM256 RNA causes inhibition of translation of respective one or more VGAM256 host target proteins.

[15075] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM256 gene, herein designated VGAM GENE, on one or

more VGAM256 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15076] It is yet further appreciated that a function of VGAM256 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM256 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM256 correlate with, and may be deduced from, the identity of the host target genes which VGAM256 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [15077] Nucleotide sequences of the VGAM256 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM256 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM256 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM256 are further described hereinbelow with reference to Table 1.
- [15078] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM256 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM256 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [15079] As mentioned hereinabove with reference to Fig. 1, a function of VGAM256 gene, herein designated VGAM is inhibition of expression of VGAM256 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM256 correlate with, and may be deduced from, the identity of the target genes which VGAM256 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [15080] Carnitine O-octanoyltransferase (CROT, Accession

NM_021151) is a VGAM256 host target gene. CROT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CROT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CROT BINDING SITE, designated SEQ ID:22125, to the nucleotide sequence of VGAM256 RNA, herein designated VGAM RNA, also designated SEQ ID:2967.

[15081] A function of VGAM256 is therefore inhibition of Carnitine O-octanoyltransferase (CROT, Accession NM_021151), a gene which CROT plays a crucial role in the beta-oxidation of branched-chain fatty acids including pristanic acid. Accordingly, utilities of VGAM256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CROT. The function of CROT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM70.D10S170 (Accession NM_005436) is another VGAM256 host target gene. D10S170 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by D10S170, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of D10S170 BINDING SITE, designated SEQ ID:11920, to the nucleotide sequence of VGAM256 RNA, herein designated VGAM RNA, also designated SEQ ID:2967.

[15082] Another function of VGAM256 is therefore inhibition of D10S170 (Accession NM_005436), a gene which may provide a structural basis for generation of RET/PTC1 rearrangement . Accordingly, utilities of VGAM256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with D10S170. The function of D10S170 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM142.MHC Class II Transactivator (MHC2TA, Accession NM_000246) is another VGAM256 host target gene. MHC2TA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MHC2TA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MHC2TA BINDING SITE, designated SEQ

ID:5776, to the nucleotide sequence of VGAM256 RNA, herein designated VGAM RNA, also designated SEQ ID:2967.

[15083] Another function of VGAM256 is therefore inhibition of MHC Class II Transactivator (MHC2TA, Accession NM_000246). Accordingly, utilities of VGAM256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MHC2TA. Neuroligin 2 (NLGN2, Accession XM_113932) is another VGAM256 host target gene. NLGN2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NLGN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NLGN2 BINDING SITE, designated SEQ ID:42551, to the nucleotide sequence of VGAM256 RNA, herein designated VGAM RNA, also designated SEQ ID:2967.

[15084] Another function of VGAM256 is therefore inhibition of Neuroligin 2 (NLGN2, Accession XM_113932), a gene which rapidly hydrolyzes choline released into the synapse. Accordingly, utilities of VGAM256 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with NLGN2. The function of NLGN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. Src Family Associated Phosphoprotein 2 (SCAP2, Accession NM_003930) is another VGAM256 host target gene. SCAP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAP2 BINDING SITE, designated SEQ ID:10030, to the nucleotide sequence of VGAM256 RNA, herein designated VGAM RNA, also designated SEQ ID:2967.

[15085] Another function of VGAM256 is therefore inhibition of Src Family Associated Phosphoprotein 2 (SCAP2, Accession NM_003930), a gene which interacts with Src family protein tyrosine kinases and SLAP/FYB (SLA). Accordingly, utilities of VGAM256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAP2. The function of SCAP2 and its association with various diseases and clinical conditions, has been es-

established by previous studies, as described hereinabove with reference to VGAM134.DKFZP566M114 (Accession NM_032128) is another VGAM256 host target gene. DKFZP566M114 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP566M114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566M114 BINDING SITE, designated SEQ ID:25814, to the nucleotide sequence of VGAM256 RNA, herein designated VGAM RNA, also designated SEQ ID:2967.

[15086] Another function of VGAM256 is therefore inhibition of DKFZP566M114 (Accession NM_032128). Accordingly, utilities of VGAM256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566M114. FLJ22833 (Accession NM_022837) is another VGAM256 host target gene. FLJ22833 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22833, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

FLJ22833 BINDING SITE, designated SEQ ID:23123, to the nucleotide sequence of VGAM256 RNA, herein designated VGAM RNA, also designated SEQ ID:2967.

[15087] Another function of VGAM256 is therefore inhibition of FLJ22833 (Accession NM_022837). Accordingly, utilities of VGAM256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22833. LHX6 (Accession NM_014368) is another VGAM256 host target gene. LHX6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LHX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LHX6 BINDING SITE, designated SEQ ID:15698, to the nucleotide sequence of VGAM256 RNA, herein designated VGAM RNA, also designated SEQ ID:2967.

[15088] Another function of VGAM256 is therefore inhibition of LHX6 (Accession NM_014368). Accordingly, utilities of VGAM256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHX6. Protein Serine Kinase H1 (PSKH1, Accession XM_043047) is another VGAM256 host target gene. PSKH1 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSKH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSKH1 BINDING SITE, designated SEQ ID:33869, to the nucleotide sequence of VGAM256 RNA, herein designated VGAM RNA, also designated SEQ ID:2967.

[15089] Another function of VGAM256 is therefore inhibition of Protein Serine Kinase H1 (PSKH1, Accession XM_043047). Accordingly, utilities of VGAM256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSKH1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 257 (VGAM257) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15090] VGAM257 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM257 was detected is described hereinabove with reference to Figs. 1-8.

[15091] VGAM257 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM257 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15092] VGAM257 gene encodes a VGAM257 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM257 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM257 precursor RNA is designated SEQ ID:243, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:243 is located at position 100658 relative to the genome of Callitrichine Herpesvirus 3.

[15093] VGAM257 precursor RNA folds onto itself, forming VGAM257 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[15094] An enzyme complex designated DICER COMPLEX, `dices` the VGAM257 folded precursor RNA into VGAM257 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM257 RNA is designated SEQ ID:2968, and is provided hereinbelow with reference to the sequence listing part.

[15095] VGAM257 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM257 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM257 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15096] VGAM257 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM257 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM257 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM257 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM257 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[15097] The complementary binding of VGAM257 RNA, herein designated VGAM RNA, to host target binding sites on VGAM257 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM257 host target RNA into VGAM257 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15098] It is appreciated that VGAM257 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM257 host target genes. The mRNA of each one of this plurality of VGAM257 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM257 RNA, herein designated VGAM RNA, and which when bound by VGAM257 RNA causes inhibition of translation of respective one or more VGAM257 host target proteins.

[15099] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM257 gene, herein designated VGAM GENE, on one or more VGAM257 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15100] It is yet further appreciated that a function of VGAM257 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM257 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM257 correlate with, and may be deduced from, the identity of the host target genes which VGAM257 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15101] Nucleotide sequences of the VGAM257 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM257 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM257 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM257 are further described hereinbelow with reference to Table 1.

[15102] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM257 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM257 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15103] As mentioned hereinabove with reference to Fig. 1, a function of VGAM257 gene, herein designated VGAM is inhibition of expression of VGAM257 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM257 correlate with, and may be deduced from, the identity of the target genes which VGAM257 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15104] Caspase 4, Apoptosis-related Cysteine Protease (CASP4, Accession NM_033307) is a VGAM257 host target gene. CASP4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CASP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of CASP4 BINDING SITE, designated SEQ ID:27142, to the nucleotide sequence of VGAM257 RNA, herein designated VGAM RNA, also designated SEQ ID:2968.

[15105] A function of VGAM257 is therefore inhibition of Caspase 4, Apoptosis-related Cysteine Protease (CASP4, Accession NM_033307), a gene which is an apoptosis-related caspase and involves in the activation cascade of caspases responsible for apoptosis execution. Accordingly, utilities of VGAM257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP4. The function of CASP4 has been established by previous studies. Cysteine proteases related to mammalian interleukin-1-beta converting enzyme (ICE; 147678) and nematode CED3 have been implicated in apoptotic cell death. By screening a human thymus cDNA library with the human ICE coding sequence, Kamens et al. (1995) isolated cDNAs encoding CASP4, named ICH2 (ICE and CED3 homolog-2) by them. The 377-amino acid ICH2 protein has 53% amino acid identity with ICE and contains the residues conserved in all ICE family members. ICH2 and ICE share catalytic properties but may differ in substrate

specificities, suggesting that the 2 enzymes have different functions in vivo. Overexpression of ICH2 in insect cells induced apoptosis. By Northern blot analysis, ICH2 was expressed as an approximately 1.7-kb transcript in all tissues examined, with the exception of brain. The ICH2 coding sequence is contained within 8 exons. The authors mapped the ICH2 gene to a P1 clone containing the ICE gene, which is located at 11q22.2–q22.3. Animal model experiments lend further support to the function of CASP4. Wang et al. (1998) reported the inactivation of mouse casp11, which is most homologous to human CASP4, by gene targeting. Like Ice-deficient mice, casp11 mutant mice are resistant to endotoxic shock induced by lipopolysaccharide. Production of both IL1- α and IL1- β after lipopolysaccharide stimulation, a crucial event during septic shock and an indication of ICE activation, is blocked in casp11 mutant mice. Casp11 mutant embryonic fibroblast cells are resistant to apoptosis induced by overexpression of ICE. Furthermore, Wang et al. (1998) found that pro-caspase-11 physically interacts with pro-ICE in cells and that the expression of casp11 is essential for activation of ICE. The authors suggested that caspase-11 is a component of the ICE complex and is re-

quired for the activation of ICE.

[15106] It is appreciated that the abovementioned animal model for CASP4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[15107] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15108] Wang, S.; Miura, M.; Jung, Y.; Zhu, H.; Li, E.; Yuan, J. : Murine caspase-11, an ICE-interacting protease, is essential for the activation of ICE. Cell 92: 501-509, 1998. ; and

[15109] Kamens, J.; Paskind, M.; Hugunin, M.; Talanian, R. V.; Allen, H.; Banach, D.; Bump, N.; Hackett, M.; Johnston, C. G.; Li, P.; Mankovich, J. A.; Terranova, M.; Ghayur, T. : Identification.

[15110] Further studies establishing the function and utilities of CASP4 are found in John Hopkins OMIM database record ID 602664, and in cited publications numbered 5915-591 and 5913-5914 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Major Histocompatibility Complex, Class II, DQ Alpha 1 (HLA-DQA1, Accession XM_175260) is another VGAM257 host target gene. HLA-DQA1 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HLA-DQA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HLA-DQA1 BINDING SITE, designated SEQ ID:46727, to the nucleotide sequence of VGAM257 RNA, herein designated VGAM RNA, also designated SEQ ID:2968.

[15111] Another function of VGAM257 is therefore inhibition of Major Histocompatibility Complex, Class II, DQ Alpha 1 (HLA-DQA1, Accession XM_175260), a gene which is alpha 1 chain of HLA-DQ1 class II molecule (Ia antigen) which binds peptides and presents them to CD4+ T lymphocytes. Accordingly, utilities of VGAM257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HLA-DQA1. The function of HLA-DQA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM132.FLJ11210 (Accession XM_005298) is another VGAM257 host target gene. FLJ11210 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11210, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11210 BINDING SITE, designated SEQ ID:29972, to the nucleotide sequence of VGAM257 RNA, herein designated VGAM RNA, also designated SEQ ID:2968.

[15112] Another function of VGAM257 is therefore inhibition of FLJ11210 (Accession XM_005298). Accordingly, utilities of VGAM257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11210. FLJ14564 (Accession XM_084459) is another VGAM257 host target gene. FLJ14564 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14564, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14564 BINDING SITE, designated SEQ ID:37599, to the nucleotide sequence of VGAM257 RNA, herein designated VGAM RNA, also designated SEQ ID:2968.

[15113] Another function of VGAM257 is therefore inhibition of FLJ14564 (Accession XM_084459). Accordingly, utilities of VGAM257 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ14564. KIAA1854 (Accession XM_049884) is another VGAM257 host target gene. KIAA1854 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1854 BINDING SITE, designated SEQ ID:35527, to the nucleotide sequence of VGAM257 RNA, herein designated VGAM RNA, also designated SEQ ID:2968.

[15114] Another function of VGAM257 is therefore inhibition of KIAA1854 (Accession XM_049884). Accordingly, utilities of VGAM257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1854. PIP3-E (Accession XM_039749) is another VGAM257 host target gene. PIP3-E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIP3-E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP3-E BINDING SITE, designated SEQ ID:33178, to the nucleotide sequence of

VGAM257 RNA, herein designated VGAM RNA, also designated SEQ ID:2968.

[15115] Another function of VGAM257 is therefore inhibition of PIP3-E (Accession XM_039749). Accordingly, utilities of VGAM257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP3-E. LOC135932 (Accession XM_072433) is another VGAM257 host target gene. LOC135932 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC135932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135932 BINDING SITE, designated SEQ ID:37499, to the nucleotide sequence of VGAM257 RNA, herein designated VGAM RNA, also designated SEQ ID:2968.

[15116] Another function of VGAM257 is therefore inhibition of LOC135932 (Accession XM_072433). Accordingly, utilities of VGAM257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135932. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 258 (VGAM258) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15117] VGAM258 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM258 was detected is described hereinabove with reference to Figs. 1–8.

[15118] VGAM258 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM258 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15119] VGAM258 gene encodes a VGAM258 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM258 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM258 precursor RNA is designated SEQ ID:244, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:244 is located at position 29168 relative to the genome of Callitrichine Herpesvirus 3.

[15120] VGAM258 precursor RNA folds onto itself, forming VGAM258 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15121] An enzyme complex designated DICER COMPLEX, `dices` the VGAM258 folded precursor RNA into VGAM258 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM258 RNA is designated SEQ ID:2969, and is provided hereinbelow with reference to the sequence listing part.

[15122] VGAM258 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM258 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM258 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15123] VGAM258 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM258 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM258 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM258 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM258 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15124] The complementary binding of VGAM258 RNA, herein designated VGAM RNA, to host target binding sites on VGAM258 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM258 host target RNA into VGAM258 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15125] It is appreciated that VGAM258 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM258 host target genes. The mRNA of each one of this plurality of VGAM258 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM258 RNA, herein designated VGAM RNA, and which when bound by VGAM258 RNA causes inhibition of translation of respective one or more VGAM258 host target proteins.

[15126] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM258 gene, herein designated VGAM GENE, on one or more VGAM258 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15127] It is yet further appreciated that a function of VGAM258 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM258 correlate with, and may be deduced from, the identity of

the host target genes which VGAM258 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [15128] Nucleotide sequences of the VGAM258 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM258 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM258 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM258 are further described hereinbelow with reference to Table 1.
- [15129] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM258 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM258 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [15130] As mentioned hereinabove with reference to Fig. 1, a function of VGAM258 gene, herein designated VGAM is inhibition of expression of VGAM258 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM258 correlate with, and may be deduced from, the identity of the target genes which VGAM258

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15131] Heat Shock 70kDa Protein 8 (HSPA8, Accession NM_006597) is a VGAM258 host target gene. HSPA8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HSPA8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPA8 BINDING SITE, designated SEQ ID:13369, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:2969.

[15132] A function of VGAM258 is therefore inhibition of Heat Shock 70kDa Protein 8 (HSPA8, Accession NM_006597), a gene which acts as a chaperone. plays an important role in cells by transiently associating with nascent polypeptides to facilitate correct folding. Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPA8. The function of HSPA8 has been established by previous studies. Cytokine and protooncogene mRNAs are rapidly degraded through AU-rich elements in the 3-prime untranslated region. Rapid decay involves AU-rich binding

protein AUF1, which complexes with heat-shock proteins HSC70 and HSP70, translation initiation factor EIF4G (OMIM Ref. No. 600495), and poly(A)-binding protein (OMIM Ref. No. 604679). AU-rich mRNA decay is associated with displacement of EIF4G from AUF1, ubiquitination of AUF1, and degradation of AUF1 by proteasomes. Induction of HSP70 by heat shock, downregulation of the ubiquitin-proteasome network, or inactivation of ubiquitinating enzyme E1 (OMIM Ref. No. 314370), all result in HSP70 sequestration of AUF1 in the perinucleus-nucleus, and all 3 processes block decay of AU-rich mRNAs and AUF1 protein. These results link the rapid degradation of cytokine mRNAs to the ubiquitin-proteasome pathway (Larola et al., 1999). CD14 (OMIM Ref. No. 158120) and lipopolysaccharide (LPS)-binding protein (LBP; 151990) are major receptors for LPS; however, binding analyses and TNF production assays have suggested the presence of additional cell surface receptors, designated LPS-associated proteins (LAPs), that are distinct from CD14, LBP, and the Toll-like receptors (see OMIM Ref. No. TLR4; 603030). Using affinity chromatography, peptide mass fingerprinting, and fluorescence resonance energy transfer, Triantafilou et al. (2001) identified 4 diverse proteins,

heat shock cognate protein (HSPA8), HSP90A, chemokine receptor CXCR4 (OMIM Ref. No. 162643), and growth differentiation factor-5 (GDF5; 601146), on monocytes that form an activation cluster after LPS ligation and are involved in LPS signal transduction. Antibody inhibition analysis suggested that disruption of cluster formation abrogates TNF release. Triantafilou et al. (2001) proposed that heat shock proteins, which are highly conserved from bacteria to eukaryotic cells, are remnants of an ancient system of antigen presentation and defense against microbial pathogens.

- [15133] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [15134] Larola, G.; Cuesta, R.; Brewer, G.; Schneider, R. J. : Control of mRNA decay by heat shock-ubiquitin-proteasome pathway. *Science* 284: 499-502, 1999. ; and
- [15135] Triantafilou, K.; Triantafilou, M.; Dedrick, R. L. : A CD14-independent LPS receptor cluster. *Nature Immun.* 2: 338-345, 2001.
- [15136] Further studies establishing the function and utilities of HSPA8 are found in John Hopkins OMIM database record ID 600816, and in cited publications numbered

7522–7523, 821 and 12001 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Interleukin 24 (IL24, Accession NM_006850) is another VGAM258 host target gene. IL24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL24 BINDING SITE, designated SEQ ID:13719, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:2969.

[15137] Another function of VGAM258 is therefore inhibition of Interleukin 24 (IL24, Accession NM_006850), a gene which may contribute to terminal cell differentiation. Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL24. The function of IL24 has been established by previous studies. Jiang et al. (1995) used a differentiation induction subtraction hybridization strategy to identify and clone genes involved in growth control and terminal differentiation in human cancer cells. By this approach they identified melanoma differentiation-associated gene–

7 (MDA7), whose expression is upregulated as a consequence of terminal differentiation in human melanoma cells. Forced expression of MDA7 was found to be growth inhibitory toward diverse human tumor cells (Jiang et al., 1996). Huang et al. (2001) determined that the human MDA7 gene encodes a protein with a predicted size of 23.8 kD, consisting of 206 amino acids. They concluded that MDA7 represents a differentiation-, growth-, and apoptosis-associated gene with potential utility for the gene-based therapy of diverse human cancers. Animal model experiments lend further support to the function of IL24. IL24 selectively suppresses the growth of human breast cancer cells and the consequence of ectopic expression of MDA7 on human breast tumor formation in vivo in nude mice.

[15138] It is appreciated that the abovementioned animal model for IL24 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[15139] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15140] Huang, E. Y.; Madireddi, M. T.; Gopalkrishnan, R. V.;

Leszczyniecka, M.; Su, Z.; Lebedeva, I. V.; Kang, D.; Jiang, H.; Lin, J. J.; Alexandre, D.; Chen, Y.; Vozhilla, N. : {and 9 others}: Genomic structure, chromosomal localization and expression profile of a novel melanoma differentiation associated (mda-7) gene with cancer specific growth suppressing and apoptosis inducing properties. *Oncogene* 20: 7051-7063, 2001. ; and

[15141] Jiang, H.; Lin, J. J.; Su, Z.-Z.; Goldstein, N. I.; Fisher, P. B. : Subtraction hybridization identifies a novel melanoma differentiation associated gene, mda-7, modulated during human.

[15142] Further studies establishing the function and utilities of IL24 are found in John Hopkins OMIM database record ID 604136, and in cited publications numbered 4438-4442 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ligase IV, DNA, ATP-dependent (LIG4, Accession NM_002312) is another VGAM258 host target gene. LIG4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LIG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIG4 BINDING SITE, desig-

nated SEQ ID:8108, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:2969.

[15143] Another function of VGAM258 is therefore inhibition of Ligase IV, DNA, ATP-dependent (LIG4, Accession NM_002312), a gene which functions in DNA nonhomologous end-joining and V(D)J recombination. Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIG4. The function of LIG4 has been established by previous studies. Grawunder et al. (1998) showed that targeted disruption of both DNA ligase IV alleles in a human pre-B cell line rendered the cells sensitive to ionizing radiation and ablated V(D)J recombination. This phenotype could only be reversed by complementation with DNA ligase IV but not by expression of either of the remaining 2 ligases, DNA ligase I or III. Hence, DNA ligase IV is the activity responsible for the ligation step in nonhomologous DNA end joining and in V(D)J recombination. Animal model experiments lend further support to the function of LIG4. In mice, Lig4 deficiency causes embryonic lethality, massive neuronal apoptosis, arrested lymphogenesis, and various cellular defects (Frank et al., 1998). Frank et al.

(2000) assessed potential roles in this phenotype for INK4a/ARF (CDKN2A; 600160) and p53 (OMIM Ref. No. 191170), 2 proteins implicated in apoptosis and senescence. Ink4a/Arf deficiency rescued proliferation/senescence defects of Lig4-deficient fibroblasts but not other phenotypic aspects. In contrast, p53 deficiency rescued embryonic lethality, neuronal apoptosis, and fibroblast proliferation/senescence defects but not lymphocyte development or radiosensitivity. Young Lig4/p53 double-null mice routinely died from pro-B lymphomas. Thus, in the context of Lig4 deficiency, embryonic lethality and neuronal apoptosis likely result from a p53-dependent response to unrepaired DNA damage, and neuronal apoptosis and lymphocyte developmental defects can be mechanistically dissociated

[15144] It is appreciated that the abovementioned animal model for LIG4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[15145] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15146] Grawunder, U.; Zimmer, D.; Fugmann, S.; Schwarz, K.;

Lieber, M. R. : DNA ligase IV is essential for V(D)J recombination and DNA double-strand break repair in human precursor lymphocytes. Molec. Cell 2: 477-484, 1998. ; and

[15148] Further studies establishing the function and utilities of LIG4 are found in John Hopkins OMIM database record ID 601837, and in cited publications numbered 9053-9058, 887 and 8877 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 11 Open Reading Frame 23 (C11orf23, Accession NM_018312) is another VGAM258 host target gene. C11orf23 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C11orf23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf23 BINDING SITE, designated SEQ ID:20300, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ

ID:2969.

[15149] Another function of VGAM258 is therefore inhibition of Chromosome 11 Open Reading Frame 23 (C11orf23, Accession NM_018312). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf23. DKFZP434F0318 (Accession NM_030817) is another VGAM258 host target gene. DKFZP434F0318 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434F0318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434F0318 BINDING SITE, designated SEQ ID:25141, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:2969.

[15150] Another function of VGAM258 is therefore inhibition of DKFZP434F0318 (Accession NM_030817). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434F0318. GFR (Accession NM_012294) is another VGAM258 host target gene. GFR BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GFR BINDING SITE, designated SEQ ID:14638, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:2969.

[15151] Another function of VGAM258 is therefore inhibition of GFR (Accession NM_012294). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFR. KIAA1301 (Accession XM_038999) is another VGAM258 host target gene. KIAA1301 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1301 BINDING SITE, designated SEQ ID:32975, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:2969.

[15152] Another function of VGAM258 is therefore inhibition of

KIAA1301 (Accession XM_038999). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1301. KIAA1922 (Accession XM_057040) is another VGAM258 host target gene. KIAA1922 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1922, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1922 BINDING SITE, designated SEQ ID:36453, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:2969.

[15153] Another function of VGAM258 is therefore inhibition of KIAA1922 (Accession XM_057040). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1922. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM_028840) is another VGAM258 host target gene. PPP1R16B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R16B, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R16B BINDING SITE, designated SEQ ID:30767, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:2969.

[15154] Another function of VGAM258 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM_028840). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R16B. PRO2958 (Accession NM_018546) is another VGAM258 host target gene. PRO2958 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2958 BINDING SITE, designated SEQ ID:20626, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:2969.

[15155] Another function of VGAM258 is therefore inhibition of PRO2958 (Accession NM_018546). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with PRO2958. LOC145725 (Accession XM_085211) is another VGAM258 host target gene. LOC145725 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145725, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145725 BINDING SITE, designated SEQ ID:37950, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:2969.

[15156] Another function of VGAM258 is therefore inhibition of LOC145725 (Accession XM_085211). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145725. LOC145732 (Accession XM_085218) is another VGAM258 host target gene. LOC145732 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145732, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145732 BINDING SITE, designated SEQ ID:37959, to

the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:2969.

[15157] Another function of VGAM258 is therefore inhibition of LOC145732 (Accession XM_085218). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145732. LOC146540 (Accession XM_085497) is another VGAM258 host target gene. LOC146540 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146540, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146540 BINDING SITE, designated SEQ ID:38198, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:2969.

[15158] Another function of VGAM258 is therefore inhibition of LOC146540 (Accession XM_085497). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146540. LOC196957 (Accession XM_113789) is another VGAM258 host target gene. LOC196957 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC196957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196957 BINDING SITE, designated SEQ ID:42431, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:2969.

[15159] Another function of VGAM258 is therefore inhibition of LOC196957 (Accession XM_113789). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196957. LOC196961 (Accession XM_113790) is another VGAM258 host target gene. LOC196961 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196961, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196961 BINDING SITE, designated SEQ ID:42440, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:2969.

[15160] Another function of VGAM258 is therefore inhibition of LOC196961 (Accession XM_113790). Accordingly, utilities

of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196961. LOC197138 (Accession XM_113829) is another VGAM258 host target gene. LOC197138 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC197138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197138 BINDING SITE, designated SEQ ID:42458, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:2969.

[15161] Another function of VGAM258 is therefore inhibition of LOC197138 (Accession XM_113829). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197138. LOC199957 (Accession XM_114068) is another VGAM258 host target gene. LOC199957 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC199957 BINDING SITE, designated SEQ ID:42672, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:2969.

[15162] Another function of VGAM258 is therefore inhibition of LOC199957 (Accession XM_114068). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199957. LOC256940 (Accession XM_172879) is another VGAM258 host target gene. LOC256940 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256940 BINDING SITE, designated SEQ ID:46154, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:2969.

[15163] Another function of VGAM258 is therefore inhibition of LOC256940 (Accession XM_172879). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256940. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 259 (VGAM259) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15164] VGAM259 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM259 was detected is described hereinabove with reference to Figs. 1–8.

[15165] VGAM259 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM259 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15166] VGAM259 gene encodes a VGAM259 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM259 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM259 precursor RNA is designated SEQ ID:245, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:245 is located at position 56367 relative to the genome of Cal–

litrichine Herpesvirus 3.

[15167] VGAM259 precursor RNA folds onto itself, forming VGAM259 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15168] An enzyme complex designated DICER COMPLEX, `dices` the VGAM259 folded precursor RNA into VGAM259 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM259 RNA is designated SEQ ID:2970, and is provided hereinbelow with reference to the sequence listing part.

[15169] VGAM259 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM259 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM259 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15170] VGAM259 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM259 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM259 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM259 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM259 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15171] The complementary binding of VGAM259 RNA, herein designated VGAM RNA, to host target binding sites on VGAM259 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM259 host target RNA into VGAM259 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15172] It is appreciated that VGAM259 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM259 host target genes. The mRNA of each one of this plurality of VGAM259 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM259 RNA, herein designated VGAM RNA, and which when bound by VGAM259 RNA causes inhibition of translation of respective one or more VGAM259 host target proteins.

[15173] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM259 gene, herein designated VGAM GENE, on one or more VGAM259 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15174] It is yet further appreciated that a function of VGAM259 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM259

correlate with, and may be deduced from, the identity of the host target genes which VGAM259 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [15175] Nucleotide sequences of the VGAM259 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM259 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM259 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM259 are further described hereinbelow with reference to Table 1.
- [15176] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM259 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM259 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [15177] As mentioned hereinabove with reference to Fig. 1, a function of VGAM259 gene, herein designated VGAM is inhibition of expression of VGAM259 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM259 correlate with, and may be deduced

from, the identity of the target genes which VGAM259 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15178] Amino-terminal Enhancer of Split (AES, Accession NM_001130) is a VGAM259 host target gene. AES BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AES, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AES BINDING SITE, designated SEQ ID:6803, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15179] A function of VGAM259 is therefore inhibition of Amino-terminal Enhancer of Split (AES, Accession NM_001130), a gene which may function during epithelial differentiation. Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AES. The function of AES has been established by previous studies. In *Drosophila melanogaster*, neurogenesis is under the control of several loci whose products appear to determine the fate of neuroectodermal cells during embryonic development. One of these neuro-

genic loci is the enhancer of split gene complex. Hartley et al. (1988) serendipitously isolated a mouse cDNA which predicted a sequence of 202 amino acids exhibiting strong similarity with the amino-terminal region of *Drosophila* enhancer of split groucho protein. Miyasaka et al. (1993) reported the cDNA cloning, nucleotide and deduced amino acid sequencing, and tissue-specific expression of mouse and human AES (amino-terminal enhancer of split) and ESG (enhancer of split groucho) genes. (ESG is also called TLE for 'transducin-like enhancer of split.') Human AES transcripts of 1.6 kb and 1.4 kb were predominantly present in muscle, heart, and placenta. Using human/Chinese hamster hybrid cell lines, Miyasaka et al. (1993) mapped the human AES gene to chromosome 19. Hou and Li (1998) used fluorescence in situ hybridization to localize the AES gene to 19p13.3 near the transcription factor-3 (TCF3; 141741) gene. They also determined the nucleotide sequence for approximately 12 kb from the AES gene and showed that its protein-encoding sequence is interrupted by 6 introns.

[15180] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [15181] Hou, E. W.; Li, S.-L. : Genomic organization and chromosome localization to band 19p13.3 of the human AES gene: gene product exhibits strong similarity to the N-terminal domain of Drosophila enhancer of split Groucho protein. DNA Cell Biol. 17: 911-913, 1998. ; and
- [15182] Miyasaka, H.; Choudhury, B. K.; Hou, E. W.; Li, S. S.-L. : Molecular cloning and expression of mouse and human cDNA encoding AES and ESG proteins with strong similarity to Drosophila en.
- [15183] Further studies establishing the function and utilities of AES are found in John Hopkins OMIM database record ID 600188, and in cited publications numbered 10113-10115 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Contactin 2 (axonal) (CNTN2, Accession NM_005076) is another VGAM259 host target gene. CNTN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNTN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNTN2 BINDING SITE, designated SEQ ID:11523, to the nucleotide sequence of VGAM259 RNA, herein designated

VGAM RNA, also designated SEQ ID:2970.

[15184] Another function of VGAM259 is therefore inhibition of Contactin 2 (axonal) (CNTN2, Accession NM_005076), a gene which may play a role in axonal growth and cell adhesion. Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNTN2. The function of CNTN2 has been established by previous studies. The pathfinding of axons toward their targets represents an early step in the development of the nervous system. Axonal extension involves selective interactions between molecules on the surface of the axon and those in the local microenvironment. Functional studies in vitro of axonal surface glycoproteins suggest that they are involved in cell adhesion and in the promotion of neurite outgrowth. One of these proteins, the rat transient axonal glycoprotein (Tag1), is expressed by restricted subsets of central and peripheral neurons during the initial phase of neurite outgrowth (Dodd et al., 1988). Tag1 belongs to the immunoglobulin superfamily. Tsiotra et al. (1993) isolated cDNAs encoding TAX1, the human homolog of TAG1. Human TAX1 showed a high degree of homology to the rat protein and less to its chick counterpart, axonin-1, with 91 and 75% identity

at the amino acid level, respectively. The numbers of immunoglobulin (IgC2) domains and fibronectin repeats present in TAG1 were conserved among the 3 species Rickman et al. (2001) found TAX1 to be amplified in 2 high-grade gliomas among a group of 26 gliomas investigated. Furthermore, they found high levels of TAX1 mRNA in glial tumors, even in the absence of TAX1 gene amplification. Because glial tumors are highly invasive and in view of the role of TAX1 in neurite outgrowth, they investigated the potential role of TAX1 in glioma cell migration. Using an in vitro assay, they found that the migration of glioma tumor cells is profoundly reduced in the presence of either an anti-TAX1 antibody or a TAX1 antisense oligonucleotide. The findings suggested that TAX1 plays a role in glial tumorigenesis and may provide a potential target for therapeutic intervention

[15185] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15186] Dodd, J.; Morton, S. B.; Karagogeos, D.; Yamamoto, M.; Jessell, T. M. : Spatial regulation of axonal glycoprotein expression on subsets of embryonic spinal neurons. *Neuron* 1: 105–116, 1988. ; and

[15187] Rickman, D. S.; Tyagi, R.; Zhu, X.-X.; Bobek, M. P.; Song, S.; Blaivas, M.; Misek, D. E.; Israel, M. A.; Kurnit, D. M.; Ross, D. A.; Kish, P. E.; Hanash, S. M. : The gene for the axonal.

[15188] Further studies establishing the function and utilities of CNTN2 are found in John Hopkins OMIM database record ID 190197, and in cited publications numbered 5741-574 and 5733-5734 listed in the bibliography section herein-below, which are also hereby incorporated by reference. Gamma-aminobutyric Acid (GABA) A Receptor, Epsilon (GABRE, Accession NM_021990) is another VGAM259 host target gene. GABRE BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GABRE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GABRE BINDING SITE, designated SEQ ID:22532, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15189] Another function of VGAM259 is therefore inhibition of Gamma-aminobutyric Acid (GABA) A Receptor, Epsilon (GABRE, Accession NM_021990), a gene which mediates

neuronal inhibition by binding to the gaba/ benzodiazepine receptor and opening an integral chloride channel. Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABRE. The function of GABRE has been established by previous studies. Davies et al. (1997) described a member of a new class of human GABA(A) receptor subunit, the epsilon subunit. The subunit was detected in the brain and can assemble with alpha and beta subunits. Wilke et al. (1997) also identified a cDNA sequence of a gene coding for a 506-amino acid protein, representing a member of a putative new class (epsilon) of the GABA-A receptor. The gene, symbolized GABRE, encodes a polypeptide almost identical to the one reported by Davies et al. (1997). GABRE was transcribed in several different tissues, with the highest levels being detected in adult heart and placenta. Wilke et al. (1997) observed alternative splicing of GABRE transcripts isolated from different tissues at multiple positions of the gene, yielding an unusually complex variety of cDNA variants. The structure of the 5-prime region of most cDNAs is compatible with expression of GABRE in adult brain only, whereas in other tissues, most transcripts code for trun-

cated protein sequences. The GABRE gene extends over 14 kb and is clustered together with the alpha-3 (OMIM Ref. No. 305660) and the putative beta-4 GABA-A receptor subunit genes in an interval of approximately 0.8 Mb in band Xq28. It is located in the candidate regions of 2 different neurologic diseases, early-onset parkinsonism, or Waisman syndrome (OMIM Ref. No. 311510), and MRX3 (OMIM Ref. No. 309541), a form of X-linked mental retardation. Sinkkonen et al. (2000) obtained cDNAs encoding rat Gabre and Gabrq (OMIM Ref. No. 300349), which are highly divergent from their human homologs. They noted that rat Gabre and Gabrq have expression patterns distinct from those reported in primates.

[15190] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15191] Davies, P. A.; Hanna, M. C.; Hales, T. G.; Kirkness, E. F. : Insensitivity to anaesthetic agents conferred by a class of GABA(A) receptor subunit. Nature 385: 820-823, 1997. ; and

[15192] Sinkkonen, S. T.; Hanna, M. C.; Kirkness, E. F.; Korpi, E. R. : GABA-A receptor epsilon and theta subunits display unusual structural variation between species and are en-

riched in the r.

[15193] Further studies establishing the function and utilities of GABRE are found in John Hopkins OMIM database record ID 300093, and in cited publications numbered 9081–9083 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LENG4 (Accession NM_024298) is another VGAM259 host target gene. LENG4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LENG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LENG4 BINDING SITE, designated SEQ ID:23578, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15194] Another function of VGAM259 is therefore inhibition of LENG4 (Accession NM_024298), a gene which may be a transmembrane protein. Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LENG4. The function of LENG4 has been established by previous studies. Overexpression of genes is one of the genetic alterations

that may have a role in the development and progression of cancers. By immunoscreening a bladder tumor cell cDNA expression library with antibody to AN43, a bladder tumor-associated antigen, Fukunaga-Johnson et al. (1996) isolated a cDNA encoding BB1. The deduced 343-amino acid protein contains both hydrophilic and hydrophobic regions, suggesting that it may be a trans-membrane protein. Northern blot analysis revealed elevated expression of a 2.0-kb transcript in breast and bladder tumor cells compared with normal cells. Expression in the cancer cells could be reduced by treatment with gamma-interferon (IFNG; 147570). Because of a lack of reactivity of the expressed BB1 protein on Western blots, Fukunaga-Johnson et al. (1996) concluded that BB1 is distinct from the AN43 antigen. By genomic sequence analysis, Wende et al. (2000) mapped the BB1 gene, which they termed LENG4, to 19q13.4. They noted that the LENG genes, unlike other genes in the leukocyte receptor cluster on 19q13.4, do not encode proteins with immunoglobulin domains.

[15195] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15196] Fukunaga–Johnson, N.; Lee, S. W.; Liebert, M.; Grossman, H. B. : Molecular analysis of a gene, BB1, overexpressed in bladder and breast carcinoma. *Anticancer Res.* 16: 1085–1090, 1996. ; and

[15197] Wende, H.; Volz, A.; Ziegler, A. : Extensive gene duplications and a large inversion characterize the human leukocyte receptor cluster. *Immunogenetics* 51: 703–713, 2000.

[15198] Further studies establishing the function and utilities of LENG4 are found in John Hopkins OMIM database record ID 606048, and in cited publications numbered 6449 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Leucine–zipper–like Transcriptional Regulator, 1 (LZTR1, Accession NM_006767) is another VGAM259 host target gene. LZTR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LZTR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LZTR1 BINDING SITE, designated SEQ ID:13635, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15199] Another function of VGAM259 is therefore inhibition of Leucine–zipper–like Transcriptional Regulator, 1 (LZTR1, Accession NM_006767). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LZTR1. Neuroligin 2 (NLGN2, Accession XM_113932) is another VGAM259 host target gene. NLGN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NLGN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NLGN2 BINDING SITE, designated SEQ ID:42548, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15200] Another function of VGAM259 is therefore inhibition of Neuroligin 2 (NLGN2, Accession XM_113932), a gene which rapidly hydrolyzes choline released into the synapse. Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NLGN2. The function of NLGN2 and its association with various diseases and clinical conditions, has been established by previous studies, as de–

scribed hereinabove with reference to VGAM178.Chromosome 21 Open Reading Frame 25 (C21orf25, Accession XM_032945) is another VGAM259 host target gene. C21orf25 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C21orf25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf25 BINDING SITE, designated SEQ ID:31798, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15201] Another function of VGAM259 is therefore inhibition of Chromosome 21 Open Reading Frame 25 (C21orf25, Accession XM_032945). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf25. FLJ22814 (Accession NM_024916) is another VGAM259 host target gene. FLJ22814 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22814, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ22814 BINDING SITE, designated SEQ ID:24440, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15202] Another function of VGAM259 is therefore inhibition of FLJ22814 (Accession NM_024916). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22814. FLJ23519 (Accession NM_032240) is another VGAM259 host target gene. FLJ23519 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23519, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23519 BINDING SITE, designated SEQ ID:25974, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15203] Another function of VGAM259 is therefore inhibition of FLJ23519 (Accession NM_032240). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23519. HSGP25L2G (Accession XM_030771) is another VGAM259

host target gene. HSGP25L2G BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSGP25L2G, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSGP25L2G BINDING SITE, designated SEQ ID:31133, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15204] Another function of VGAM259 is therefore inhibition of HSGP25L2G (Accession XM_030771). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSGP25L2G. KIAA1257 (Accession XM_031577) is another VGAM259 host target gene. KIAA1257 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1257, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1257 BINDING SITE, designated SEQ ID:31437, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15205] Another function of VGAM259 is therefore inhibition of KIAA1257 (Accession XM_031577). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1257. MGC11352 (Accession XM_035941) is another VGAM259 host target gene. MGC11352 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC11352, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11352 BINDING SITE, designated SEQ ID:32353, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15206] Another function of VGAM259 is therefore inhibition of MGC11352 (Accession XM_035941). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11352. MGC2721 (Accession NM_032737) is another VGAM259 host target gene. MGC2721 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2721, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2721 BINDING SITE, designated SEQ ID:26461, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15207] Another function of VGAM259 is therefore inhibition of MGC2721 (Accession NM_032737). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2721. SSB-3 (Accession NM_080861) is another VGAM259 host target gene. SSB-3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSB-3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSB-3 BINDING SITE, designated SEQ ID:28099, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15208] Another function of VGAM259 is therefore inhibition of SSB-3 (Accession NM_080861). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSB-3.

TUSP (Accession NM_020245) is another VGAM259 host target gene. TUSP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TUSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUSP BINDING SITE, designated SEQ ID:21531, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15209] Another function of VGAM259 is therefore inhibition of TUSP (Accession NM_020245). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUSP. LOC124987 (Accession XM_064384) is another VGAM259 host target gene. LOC124987 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC124987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124987 BINDING SITE, designated SEQ ID:37264, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA,

also designated SEQ ID:2970.

[15210] Another function of VGAM259 is therefore inhibition of LOC124987 (Accession XM_064384). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124987. LOC145725 (Accession XM_085211) is another VGAM259 host target gene. LOC145725 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145725, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145725 BINDING SITE, designated SEQ ID:37944, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15211] Another function of VGAM259 is therefore inhibition of LOC145725 (Accession XM_085211). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145725. LOC145732 (Accession XM_085218) is another VGAM259 host target gene. LOC145732 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145732, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145732 BINDING SITE, designated SEQ ID:37953, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15212] Another function of VGAM259 is therefore inhibition of LOC145732 (Accession XM_085218). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145732. LOC157918 (Accession XM_098842) is another VGAM259 host target gene. LOC157918 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157918 BINDING SITE, designated SEQ ID:41892, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15213] Another function of VGAM259 is therefore inhibition of LOC157918 (Accession XM_098842). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC157918. LOC196957 (Accession XM_113789) is another VGAM259 host target gene. LOC196957 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC196957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196957 BINDING SITE, designated SEQ ID:42426, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15214] Another function of VGAM259 is therefore inhibition of LOC196957 (Accession XM_113789). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196957. LOC196961 (Accession XM_113790) is another VGAM259 host target gene. LOC196961 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC196961, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196961 BINDING SITE, designated SEQ ID:42435, to

the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15215] Another function of VGAM259 is therefore inhibition of LOC196961 (Accession XM_113790). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196961. LOC197138 (Accession XM_113829) is another VGAM259 host target gene. LOC197138 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC197138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197138 BINDING SITE, designated SEQ ID:42453, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15216] Another function of VGAM259 is therefore inhibition of LOC197138 (Accession XM_113829). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197138. LOC254439 (Accession XM_170659) is another VGAM259 host target gene. LOC254439 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC254439, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254439 BINDING SITE, designated SEQ ID:45433, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15217] Another function of VGAM259 is therefore inhibition of LOC254439 (Accession XM_170659). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254439. LOC255196 (Accession XM_173157) is another VGAM259 host target gene. LOC255196 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255196 BINDING SITE, designated SEQ ID:46414, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15218] Another function of VGAM259 is therefore inhibition of LOC255196 (Accession XM_173157). Accordingly, utilities

of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255196. LOC257437 (Accession XM_166089) is another VGAM259 host target gene. LOC257437 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257437, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257437 BINDING SITE, designated SEQ ID:43854, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15219] Another function of VGAM259 is therefore inhibition of LOC257437 (Accession XM_166089). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257437. LOC90019 (Accession NM_138567) is another VGAM259 host target gene. LOC90019 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90019, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC90019 BINDING SITE, designated SEQ ID:28869, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15220] Another function of VGAM259 is therefore inhibition of LOC90019 (Accession NM_138567). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90019. LOC91496 (Accession XM_038788) is another VGAM259 host target gene. LOC91496 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91496, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91496 BINDING SITE, designated SEQ ID:32920, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:2970.

[15221] Another function of VGAM259 is therefore inhibition of LOC91496 (Accession XM_038788). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91496. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 260 (VGAM260) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15222] VGAM260 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM260 was detected is described hereinabove with reference to Figs. 1–8.

[15223] VGAM260 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM260 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15224] VGAM260 gene encodes a VGAM260 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM260 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM260 precursor RNA is designated SEQ ID:246, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:246 is located at position 19614 relative to the genome of Cal–

litrichine Herpesvirus 3.

[15225] VGAM260 precursor RNA folds onto itself, forming VGAM260 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15226] An enzyme complex designated DICER COMPLEX, `dices` the VGAM260 folded precursor RNA into VGAM260 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM260 RNA is designated SEQ ID:2971, and is provided hereinbelow with reference to the sequence listing part.

[15227] VGAM260 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM260 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM260 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15228] VGAM260 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM260 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM260 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM260 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM260 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15229] The complementary binding of VGAM260 RNA, herein designated VGAM RNA, to host target binding sites on VGAM260 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM260 host target RNA into VGAM260 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15230] It is appreciated that VGAM260 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM260 host target genes. The mRNA of each one of this plurality of VGAM260 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM260 RNA, herein designated VGAM RNA, and which when bound by VGAM260 RNA causes inhibition of translation of respective one or more VGAM260 host target proteins.

[15231] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM260 gene, herein designated VGAM GENE, on one or more VGAM260 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15232] It is yet further appreciated that a function of VGAM260 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM260 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM260

correlate with, and may be deduced from, the identity of the host target genes which VGAM260 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15233] Nucleotide sequences of the VGAM260 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM260 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM260 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM260 are further described hereinbelow with reference to Table 1.

[15234] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM260 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM260 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15235] As mentioned hereinabove with reference to Fig. 1, a function of VGAM260 gene, herein designated VGAM is inhibition of expression of VGAM260 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM260 correlate with, and may be deduced

from, the identity of the target genes which VGAM260 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15236] Amylo-1, 6-glucosidase, 4-alpha-glucanotransferase (glycogen debranching enzyme, glycogen storage disease type III) (AGL, Accession NM_000644) is a VGAM260 host target gene. AGL BINDING SITE1 through AGL BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AGL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGL BINDING SITE1 through AGL BINDING SITE6, designated SEQ ID:6295, SEQ ID:6300, SEQ ID:6308, SEQ ID:5468, SEQ ID:6285 and SEQ ID:6290 respectively, to the nucleotide sequence of VGAM260 RNA, herein designated VGAM RNA, also designated SEQ ID:2971.

[15237] A function of VGAM260 is therefore inhibition of Amylo-1, 6-glucosidase, 4-alpha-glucanotransferase (glycogen debranching enzyme, glycogen storage disease type III) (AGL, Accession NM_000644). Accordingly, utilities of VGAM260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGL.

Desmoglein 1 (DSG1, Accession NM_001942) is another VGAM260 host target gene. DSG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DSG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSG1 BINDING SITE, designated SEQ ID:7655, to the nucleotide sequence of VGAM260 RNA, herein designated VGAM RNA, also designated SEQ ID:2971.

[15238] Another function of VGAM260 is therefore inhibition of Desmoglein 1 (DSG1, Accession NM_001942). Accordingly, utilities of VGAM260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSG1. Nerve Growth Factor Receptor (TNFRSF16) Associated Protein 1 (NGFRAP1, Accession NM_014380) is another VGAM260 host target gene. NGFRAP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NGFRAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NGFRAP1 BINDING SITE, designated SEQ ID:15716, to the

nucleotide sequence of VGAM260 RNA, herein designated VGAM RNA, also designated SEQ ID:2971.

[15239] Another function of VGAM260 is therefore inhibition of Nerve Growth Factor Receptor (TNFRSF16) Associated Protein 1 (NGFRAP1, Accession NM_014380), a gene which may play an important role in the pathogenesis of neuro-genetic diseases. Accordingly, utilities of VGAM260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NGFRAP1. The function of NGFRAP1 has been established by previous studies. The C-terminal cytoplasmic domain of p75(NTR) (NGFR; 162010) has a type-2 death domain. However, TRAF (e.g., TRAF6; 602355)-like proteins that interact with this domain do not affect NGF (OMIM Ref. No. 162030)-dependent apoptosis. Using a yeast 2-hybrid screen with the cytosolic domain of p75(NTR) as bait, Mukai et al. (2000) obtained cDNAs encoding mouse and human p75(NTR)-associated cell death executor, or NADE. Human NADE is identical to the HGR74 cDNA cloned by Rapp et al. (1990) from an ovarian granulosa cDNA library. HGR74 was expressed in testis, prostate, seminal vesicle, and ovarian granulosa cells (Rapp et al., 1990). By sequence analysis, Mukai et al. (2000) predicted that the

111-amino acid NADE protein has a leucine-rich nuclear export signal (NES) and 2 ubiquitination sequence boxes. Western blot analysis showed expression of mouse Nade only after proteasome inhibition, implying that native Nade is modified by the ubiquitin conjugating system. Immunofluorescence microscopy demonstrated expression of wildtype Nade, but not Nade carrying leu94-to-ala and leu97-to-ala mutations in the NES, in the cytoplasm. GST pull-down analysis indicated that the C terminus of Nade binds to the cytoplasmic cell death domain of p75(NTR). Coimmunoprecipitation analysis showed that NGF induces interaction of NADE and p75(NTR). TUNEL analysis determined that NGF, but not other neurotrophins, could induce apoptosis in cells expressing NADE and p75(NTR). NGF-treated cells expressing NADE and p75(NTR) processed CASP2 (OMIM Ref. No. 600639) and CASP3 (OMIM Ref. No. 600636) to their active forms. Confocal microscopy established that most NGF-treated oligodendrocytes underwent apoptosis and expressed NADE. Scott (2001) mapped the NGFRAP1 gene to Xq22.1-q23 based on sequence similarity between the NGFRAP1 sequence and the chromosome X clone RP13-349O20 (GenBank AL606763).

- [15240] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [15243] Further studies establishing the function and utilities of NGFRAP1 are found in John Hopkins OMIM database record ID 300361, and in cited publications numbered 6731–6733 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Procollagen-proline, 2-oxoglutarate 4-dioxygenase (proline 4-hydroxylase), Alpha Polypeptide I (P4HA1, Accession NM_000917) is another VGAM260 host target gene. P4HA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

P4HA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P4HA1 BINDING SITE, designated SEQ ID:6627, to the nucleotide sequence of VGAM260 RNA, herein designated VGAM RNA, also designated SEQ ID:2971.

[15244] Another function of VGAM260 is therefore inhibition of Procollagen-proline, 2-oxoglutarate 4-dioxygenase (proline 4-hydroxylase), Alpha Polypeptide I (P4HA1, Accession NM_000917), a gene which catalyzes the formation of 4-hydroxyproline in collagen. Accordingly, utilities of VGAM260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P4HA1. The function of P4HA1 has been established by previous studies. Prolyl 4-hydroxylase (EC 1.14.11.2) plays a central role in collagen synthesis. It catalyzes the formation of 4-hydroxyproline in collagens by hydroxylation of proline residues in peptide linkages. The 4-hydroxyproline residues are essential for the folding of the newly synthesized procollagen polypeptide chain into triple helical molecules. The active enzyme is a tetramer of 2 alpha and 2 beta subunits with a molecular weight of about

240,000. The beta subunit (P4HB; 176790) is identical to the enzyme disulfide isomerase (EC 5.3.4.1) and a major cellular thyroid-binding protein. The alpha subunit probably contributes a major part of the catalytic site of the enzyme. Helaakoski et al. (1989) isolated cDNA clones for the alpha subunit. They found that the clones encode a polypeptide of 517 amino acid residues and a signal peptide of 17 amino acids. Southern blot analyses of human genomic DNA with a cDNA probe for the alpha subunit suggested the presence of only 1 gene encoding 2 types of mRNA, which appear to result from mutually exclusive alternative splicing of primary transcripts of 1 gene.

Helaakoski et al. (1994) reported that the P4HA gene covers more than 69 kilobases and consists of 16 exons. Evidence had previously been presented for a mutually exclusive alternative splicing of RNA transcripts of the gene. The present data indicated that the mutually exclusive sequences found in the mRNAs are coded by 2 consecutive, homologous 71-bp exons, 9 and 10. These exons are identical in their first 5 basepairs and the overall identity between them is 61% at the nucleotide level and 58% at the level of the coded amino acids. Both types of mRNA were found to be expressed in all of the tissues studied,

but in some tissues the type coding for the exon 9 or exon 10 sequences was more abundant than the other type.

[15245] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15246] Helaakoski, T.; Vuori, K.; Myllyla, R.; Kivirikko, K. I.; Pihlajaniemi, T. : Molecular cloning of the alpha-subunit of human prolyl 4-hydroxylase: the complete cDNA-derived amino acid sequence and evidence for alternative splicing of RNA transcripts. Proc. Nat. Acad. Sci. 86: 4392-4396, 1989. ; and

[15247] Helaakoski, T.; Veijola, J.; Vuori, K.; Rehn, M.; Chow, L. T.; Taillon-Miller, P.; Kivirikko, K. I.; Pihlajaniemi, T. : Structure and expression of the human gene for the alpha subunit.

[15248] Further studies establishing the function and utilities of P4HA1 are found in John Hopkins OMIM database record ID 176710, and in cited publications numbered 1523-152 and 1528-1527 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ATPase, (Na⁺)/K⁺ Transporting, Beta 4 Polypeptide (ATP1B4, Accession NM_012069) is another VGAM260

host target gene. ATP1B4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP1B4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1B4 BINDING SITE, designated SEQ ID:14329, to the nucleotide sequence of VGAM260 RNA, herein designated VGAM RNA, also designated SEQ ID:2971.

[15249] Another function of VGAM260 is therefore inhibition of ATPase, (Na⁺)/K⁺ Transporting, Beta 4 Polypeptide (ATP1B4, Accession NM_012069). Accordingly, utilities of VGAM260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1B4. KIAA1209 (Accession XM_027307) is another VGAM260 host target gene. KIAA1209 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1209, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1209 BINDING SITE, designated SEQ ID:30475, to the nucleotide sequence of VGAM260 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2971.

[15250] Another function of VGAM260 is therefore inhibition of KIAA1209 (Accession XM_027307). Accordingly, utilities of VGAM260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1209. MGC15482 (Accession NM_032875) is another VGAM260 host target gene. MGC15482 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC15482, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15482 BINDING SITE, designated SEQ ID:26696, to the nucleotide sequence of VGAM260 RNA, herein designated VGAM RNA, also designated SEQ ID:2971.

[15251] Another function of VGAM260 is therefore inhibition of MGC15482 (Accession NM_032875). Accordingly, utilities of VGAM260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15482. LOC130733 (Accession XM_059466) is another VGAM260 host target gene. LOC130733 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130733, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130733 BINDING SITE, designated SEQ ID:37004, to the nucleotide sequence of VGAM260 RNA, herein designated VGAM RNA, also designated SEQ ID:2971.

[15252] Another function of VGAM260 is therefore inhibition of LOC130733 (Accession XM_059466). Accordingly, utilities of VGAM260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130733. LOC152059 (Accession XM_087372) is another VGAM260 host target gene. LOC152059 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152059, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152059 BINDING SITE, designated SEQ ID:39210, to the nucleotide sequence of VGAM260 RNA, herein designated VGAM RNA, also designated SEQ ID:2971.

[15253] Another function of VGAM260 is therefore inhibition of LOC152059 (Accession XM_087372). Accordingly, utilities of VGAM260 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC152059. LOC154743 (Accession XM_088029) is another VGAM260 host target gene. LOC154743 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154743, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154743 BINDING SITE, designated SEQ ID:39480, to the nucleotide sequence of VGAM260 RNA, herein designated VGAM RNA, also designated SEQ ID:2971.

[15254] Another function of VGAM260 is therefore inhibition of LOC154743 (Accession XM_088029). Accordingly, utilities of VGAM260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154743. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 261 (VGAM261) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15255] VGAM261 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM261 was detected is described hereinabove with reference to Figs. 1–8.

[15256] VGAM261 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM261 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15257] VGAM261 gene encodes a VGAM261 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM261 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM261 precursor RNA is designated SEQ ID:247, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:247 is located at position 117465 relative to the genome of Callitrichine Herpesvirus 3.

[15258] VGAM261 precursor RNA folds onto itself, forming VGAM261 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15259] An enzyme complex designated DICER COMPLEX, `dices` the VGAM261 folded precursor RNA into VGAM261 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM261 RNA is designated SEQ ID:2972, and is provided hereinbelow with reference to the sequence listing part.

[15260] VGAM261 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM261 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM261 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15261] VGAM261 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM261 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM261 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM261 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM261 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15262] The complementary binding of VGAM261 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM261 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM261 host target RNA into VGAM261 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15263] It is appreciated that VGAM261 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM261 host target genes. The mRNA of each one of this plurality of VGAM261 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM261 RNA, herein designated VGAM RNA, and which when bound by VGAM261 RNA causes inhibition of translation of respective one or more VGAM261 host target proteins.

[15264] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM261 gene, herein designated VGAM GENE, on one or more VGAM261 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15265] It is yet further appreciated that a function of VGAM261 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM261 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM261 correlate with, and may be deduced from, the identity of the host target genes which VGAM261 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15266] Nucleotide sequences of the VGAM261 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM261 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM261 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM261 are further described hereinbelow with reference to Table 1.

[15267] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM261 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM261 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15268] As mentioned hereinabove with reference to Fig. 1, a function of VGAM261 gene, herein designated VGAM is inhibition of expression of VGAM261 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM261 correlate with, and may be deduced from, the identity of the target genes which VGAM261 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15269] Platelet-derived Growth Factor Receptor, Beta Polypeptide (PDGFRB, Accession XM_038350) is a VGAM261 host target gene. PDGFRB BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by PDGFRB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDGFRB BINDING SITE, designated SEQ ID:32813, to the nucleotide sequence of VGAM261 RNA, herein designated VGAM RNA, also designated SEQ ID:2972.

[15270] A function of VGAM261 is therefore inhibition of Platelet-derived Growth Factor Receptor, Beta Polypeptide (PDGFRB, Accession XM_038350), a gene which Platelet-derived growth factor receptor beta chain; tyrosine kinase receptor. Accordingly, utilities of VGAM261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDGFRB. The function of PDGFRB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM125. Promyelocytic Leukemia (PML, Accession NM_033238) is another VGAM261 host target gene. PML BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PML, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PML BINDING SITE, designated SEQ ID:27076, to the nucleotide sequence of VGAM261 RNA, herein designated VGAM RNA, also designated SEQ ID:2972.

[15271] Another function of VGAM261 is therefore inhibition of Promyelocytic Leukemia (PML, Accession NM_033238). Accordingly, utilities of VGAM261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PML. Pleckstrin and Sec7 Domain Protein (PSD, Accession NM_002779) is another VGAM261 host target gene. PSD BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PSD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSD BINDING SITE, designated SEQ ID:8668, to the nucleotide sequence of VGAM261 RNA, herein designated VGAM RNA, also designated SEQ ID:2972.

[15272] Another function of VGAM261 is therefore inhibition of Pleckstrin and Sec7 Domain Protein (PSD, Accession NM_002779), a gene which promotes guanine-nucleotide exchange on arf6. Accordingly, utilities of VGAM261 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with PSD. The function of PSD has been established by previous studies. Perletti et al. (1997) identified a novel human gene on 10q24, contiguous to the 3-prime end of the NFKB2 gene (OMIM Ref. No. 164012) in a tail-to-tail arrangement. They described a cDNA of 4,307 bp, isolated from an adult human brain cDNA library, which contains an open reading frame encoding a putative protein of 645 amino acids with a predicted molecular weight of 71 kD. Database homology searches indicated that the novel gene codes for a putative protein containing 2 discrete domains with significant homology to the Sec7 and pleckstrin-homology (PH) domains, respectively. They used the gene symbol PSD for 'pleckstrin-Sec7 domains.' Northern blot analysis of a panel of RNAs from normal human tissues using the PSD cDNA as probe revealed the presence of 3 different tissue-specific transcripts of approximately 4.3, 2.3, and 1.8 kb, the longest of which was expressed only in brain. The data suggested that the PSD gene may encode a protein related to the protein family containing both the Sec7 in the PH domains and thought to be involved in signaling transduction processes. Other human proteins in the

same family include cytohesin-1 (Kolanus et al., 1996) and ARNO (OMIM Ref. No. 602488) (Chardin et al., 1996).

[15273] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15274] Kolanus, W.; Nagel, W.; Schiller, B.; Zeitlmann, L.; Godar, S.; Stockinger, H.; Seed, B. : Alpha-L-beta-2 integrin/ LFA-1 binding to ICAM-1 induced by cytohesin-1, a cytoplasmic regulatory molecule. Cell 86: 233-242, 1996. ; and

[15275] Perletti, L.; Talarico, D.; Trecca, D.; Ronchetti, D.; Fracchiolla, N. S.; Maiolo, A. T.; Neri, A. : Identification of a novel gene, PSD, adjacent to NFkB2/lyt-10, which contains Sec7 an.

[15276] Further studies establishing the function and utilities of PSD are found in John Hopkins OMIM database record ID 602327, and in cited publications numbered 600 and 10704 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 9 (SERPINB9, Accession NM_004155) is another VGAM261 host target gene. SERPINB9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by SERPINB9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERPINB9 BINDING SITE, designated SEQ ID:10364, to the nucleotide sequence of VGAM261 RNA, herein designated VGAM RNA, also designated SEQ ID:2972.

[15277] Another function of VGAM261 is therefore inhibition of Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 9 (SERPINB9, Accession NM_004155), a gene which may be a serpin serine protease inhibitor that interacts with granzyme B (GZMB). Accordingly, utilities of VGAM261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINB9. The function of SERPINB9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM60. Src-like-adaptor 2 (SLA2, Accession NM_032214) is another VGAM261 host target gene. SLA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of SLA2 BINDING SITE, designated SEQ ID:25941, to the nucleotide sequence of VGAM261 RNA, herein designated VGAM RNA, also designated SEQ ID:2972.

[15278] Another function of VGAM261 is therefore inhibition of Src-like-adaptor 2 (SLA2, Accession NM_032214). Accordingly, utilities of VGAM261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLA2. Apolipoprotein L, 3 (APOL3, Accession NM_014349) is another VGAM261 host target gene.

APOL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APOL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOL3 BINDING SITE, designated SEQ ID:15674, to the nucleotide sequence of VGAM261 RNA, herein designated VGAM RNA, also designated SEQ ID:2972.

[15279] Another function of VGAM261 is therefore inhibition of Apolipoprotein L, 3 (APOL3, Accession NM_014349). Accordingly, utilities of VGAM261 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with APOL3. ERAP140 (Accession XM_059748) is another VGAM261 host target gene. ERAP140 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ERAP140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERAP140 BINDING SITE, designated SEQ ID:37084, to the nucleotide sequence of VGAM261 RNA, herein designated VGAM RNA, also designated SEQ ID:2972.

[15280] Another function of VGAM261 is therefore inhibition of ERAP140 (Accession XM_059748). Accordingly, utilities of VGAM261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERAP140. IKKE (Accession NM_014002) is another VGAM261 host target gene. IKKE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IKKE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IKKE BINDING SITE, designated SEQ ID:15201, to the nucleotide sequence of VGAM261 RNA,

herein designated VGAM RNA, also designated SEQ ID:2972.

[15281] Another function of VGAM261 is therefore inhibition of IKKE (Accession NM_014002). Accordingly, utilities of VGAM261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IKKE. LOC127534 (Accession XM_060532) is another VGAM261 host target gene. LOC127534 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127534 BINDING SITE, designated SEQ ID:37168, to the nucleotide sequence of VGAM261 RNA, herein designated VGAM RNA, also designated SEQ ID:2972.

[15282] Another function of VGAM261 is therefore inhibition of LOC127534 (Accession XM_060532). Accordingly, utilities of VGAM261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127534. LOC145082 (Accession XM_096719) is another VGAM261 host target gene. LOC145082 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC145082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145082 BINDING SITE, designated SEQ ID:40492, to the nucleotide sequence of VGAM261 RNA, herein designated VGAM RNA, also designated SEQ ID:2972.

[15283] Another function of VGAM261 is therefore inhibition of LOC145082 (Accession XM_096719). Accordingly, utilities of VGAM261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145082. LOC170082 (Accession XM_093092) is another VGAM261 host target gene. LOC170082 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC170082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170082 BINDING SITE, designated SEQ ID:40169, to the nucleotide sequence of VGAM261 RNA, herein designated VGAM RNA, also designated SEQ ID:2972.

[15284] Another function of VGAM261 is therefore inhibition of LOC170082 (Accession XM_093092). Accordingly, utilities

of VGAM261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170082. LOC220370 (Accession XM_166943) is another VGAM261 host target gene. LOC220370 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220370, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220370 BINDING SITE, designated SEQ ID:44598, to the nucleotide sequence of VGAM261 RNA, herein designated VGAM RNA, also designated SEQ ID:2972.

[15285] Another function of VGAM261 is therefore inhibition of LOC220370 (Accession XM_166943). Accordingly, utilities of VGAM261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220370. LOC221540 (Accession XM_168133) is another VGAM261 host target gene. LOC221540 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221540, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC221540 BINDING SITE, designated SEQ ID:45043, to the nucleotide sequence of VGAM261 RNA, herein designated VGAM RNA, also designated SEQ ID:2972.

[15286] Another function of VGAM261 is therefore inhibition of LOC221540 (Accession XM_168133). Accordingly, utilities of VGAM261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221540. LOC257545 (Accession XM_175217) is another VGAM261 host target gene. LOC257545 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257545, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257545 BINDING SITE, designated SEQ ID:46691, to the nucleotide sequence of VGAM261 RNA, herein designated VGAM RNA, also designated SEQ ID:2972.

[15287] Another function of VGAM261 is therefore inhibition of LOC257545 (Accession XM_175217). Accordingly, utilities of VGAM261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257545. LOC257598 (Accession XM_175295) is another VGAM261 host target gene. LOC257598 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257598 BINDING SITE, designated SEQ ID:46748, to the nucleotide sequence of VGAM261 RNA, herein designated VGAM RNA, also designated SEQ ID:2972.

[15288] Another function of VGAM261 is therefore inhibition of LOC257598 (Accession XM_175295). Accordingly, utilities of VGAM261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257598. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 262 (VGAM262) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15289] VGAM262 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM262 was detected is described hereinabove with reference to Figs. 1-8.

[15290] VGAM262 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM262 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15291] VGAM262 gene encodes a VGAM262 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM262 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM262 precursor RNA is designated SEQ ID:248, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:248 is located at position 13862 relative to the genome of Callitrichine Herpesvirus 3.

[15292] VGAM262 precursor RNA folds onto itself, forming VGAM262 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[15293] An enzyme complex designated DICER COMPLEX, `dices` the VGAM262 folded precursor RNA into VGAM262 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM262 RNA is designated SEQ ID:2973, and is provided hereinbelow with reference to the sequence listing part.

[15294] VGAM262 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM262 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM262 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15295] VGAM262 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM262 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM262 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM262 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM262 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[15296] The complementary binding of VGAM262 RNA, herein designated VGAM RNA, to host target binding sites on VGAM262 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM262 host target RNA into VGAM262 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15297] It is appreciated that VGAM262 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM262 host target genes. The mRNA of each one of this plurality of VGAM262 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM262 RNA, herein designated VGAM RNA, and which when bound by VGAM262 RNA causes inhibition of translation of respective one or more VGAM262 host target proteins.

[15298] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM262 gene, herein designated VGAM GENE, on one or more VGAM262 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15299] It is yet further appreciated that a function of VGAM262 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM262 correlate with, and may be deduced from, the identity of the host target genes which VGAM262 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15300] Nucleotide sequences of the VGAM262 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM262 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM262 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM262 are further described hereinbelow with reference to Table 1.

[15301] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM262 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM262 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15302] As mentioned hereinabove with reference to Fig. 1, a function of VGAM262 gene, herein designated VGAM is inhibition of expression of VGAM262 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM262 correlate with, and may be deduced from, the identity of the target genes which VGAM262 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15303] FLJ21432 (Accession NM_024551) is a VGAM262 host target gene. FLJ21432 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21432, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21432 BINDING SITE, designated SEQ ID:23765, to the nucleotide sequence of VGAM262

RNA, herein designated VGAM RNA, also designated SEQ ID:2973.

[15304] A function of VGAM262 is therefore inhibition of FLJ21432 (Accession NM_024551). Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21432. LOC204010 (Accession XM_115138) is another VGAM262 host target gene. LOC204010 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC204010, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204010 BINDING SITE, designated SEQ ID:43081, to the nucleotide sequence of VGAM262 RNA, herein designated VGAM RNA, also designated SEQ ID:2973.

[15305] Another function of VGAM262 is therefore inhibition of LOC204010 (Accession XM_115138). Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204010. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 263 (VGAM263) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15306] VGAM263 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM263 was detected is described hereinabove with reference to Figs. 1–8.

[15307] VGAM263 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM263 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15308] VGAM263 gene encodes a VGAM263 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM263 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM263 precursor RNA is designated SEQ ID:249, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:249 is located at position 131570 relative to the genome of Callitrichine Herpesvirus 3.

[15309] VGAM263 precursor RNA folds onto itself, forming VGAM263 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15310] An enzyme complex designated DICER COMPLEX, `dices` the VGAM263 folded precursor RNA into VGAM263 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM263 RNA is designated SEQ ID:2974, and is provided hereinbelow with reference to the sequence listing part.

[15311] VGAM263 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM263 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM263 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15312] VGAM263 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM263 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM263 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM263 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM263 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15313] The complementary binding of VGAM263 RNA, herein designated VGAM RNA, to host target binding sites on VGAM263 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM263 host target RNA into VGAM263 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15314] It is appreciated that VGAM263 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM263 host target genes. The mRNA of each one of this plurality of VGAM263 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM263 RNA, herein designated VGAM RNA, and which when bound by VGAM263 RNA causes inhibition of translation of respective one or more VGAM263 host target proteins.

[15315] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM263 gene, herein designated VGAM GENE, on one or more VGAM263 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15316] It is yet further appreciated that a function of VGAM263 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM263 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM263 correlate with, and may be deduced from, the identity of

the host target genes which VGAM263 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [15317] Nucleotide sequences of the VGAM263 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM263 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM263 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM263 are further described hereinbelow with reference to Table 1.
- [15318] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM263 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM263 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [15319] As mentioned hereinabove with reference to Fig. 1, a function of VGAM263 gene, herein designated VGAM is inhibition of expression of VGAM263 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM263 correlate with, and may be deduced from, the identity of the target genes which VGAM263

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15320] Histone Deacetylase 5 (HDAC5, Accession NM_139205) is a VGAM263 host target gene. HDAC5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HDAC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDAC5 BINDING SITE, designated SEQ ID:29221, to the nucleotide sequence of VGAM263 RNA, herein designated VGAM RNA, also designated SEQ ID:2974.

[15321] A function of VGAM263 is therefore inhibition of Histone Deacetylase 5 (HDAC5, Accession NM_139205), a gene which is responsible for the deacetylation of lysine residues on the n-terminal part of the core histones and mediate transcriptional regulation. Accordingly, utilities of VGAM263 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDAC5. The function of HDAC5 has been established by previous studies. Members of the myocyte enhancer factor-2 (MEF2A; 600660) family of transcription factors associate with myogenic basic helix-loop-helix transcription factors

such as MYOD1 (OMIM Ref. No. 159970) to activate skeletal myogenesis. MEF2 proteins also interact with the class II histone deacetylases HDAC4 and HDAC5, resulting in repression of MEF2-dependent genes. Execution of the muscle differentiation program requires release of MEF2 from repression by HDACs, which are expressed constitutively in myoblasts and myotubes. McKinsey et al. (2000) demonstrated that HDAC5 shuttles from the nucleus to the cytoplasm when myoblasts are triggered to differentiate. Calcium/calmodulin-dependent protein kinase (CAMK1; 604998) signaling, which stimulates myogenesis and prevents formation of MEF2-HDAC complexes, also induces nuclear export of HDAC4 and HDAC5 by phosphorylation of these transcriptional repressors. An HDAC5 mutant lacking 2 CAMK phosphorylation sites is resistant to CAMK-mediated nuclear export and acts as a dominant inhibitor of skeletal myogenesis, whereas a cytoplasmic HDAC5 mutant is unable to block efficiently the muscle differentiation program. McKinsey et al. (2000) concluded that their results highlight a mechanism for transcriptional regulation through signal and differentiation-dependent nuclear export of a chromatin-remodeling enzyme, and suggest that nucleocytoplasmic trafficking of HDACs is in-

volved in the control of cellular differentiation. Nagase et al. (1998) isolated a partial cDNA encoding HDAC5, which they called KIAA0600, from a brain cDNA library. RT-PCR analysis detected HDAC5 expression in all tissues tested, with relatively low expression in spleen and pancreas. By serologic analysis of recombinant colon cancer cDNA expression libraries, Scanlan et al. (1998) identified a partial cDNA encoding HDAC5, which they called NYCO9. Northern blot and RT-PCR analysis indicated weak but universal expression of a 3.7-kb HDAC5 transcript. Serologic analysis demonstrated that 5 of 29 colon cancer patients had antibodies to HDAC5.

[15322] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15323] Nagase, T.; Ishikawa, K.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. IX. The complete sequences of 100 new cDNA clones from brain which can code for large proteins in vitro. DNA Res. 5: 31-39, 1998. ; and

[15324] McKinsey, T. A.; Zhang, C.-L.; Lu, J.; Olson, E. N. : Signal-dependent nuclear export of a histone deacetylase regu-

lates muscle differentiation. Nature 408: 106–111, 2000.

[15325] Further studies establishing the function and utilities of HDAC5 are found in John Hopkins OMIM database record ID 605315, and in cited publications numbered 10820–448 and 6735 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Interleukin 1 Family, Member 5 (delta) (IL1F5, Accession NM_012275) is another VGAM263 host target gene. IL1F5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL1F5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1F5 BINDING SITE, designated SEQ ID:14595, to the nucleotide sequence of VGAM263 RNA, herein designated VGAM RNA, also designated SEQ ID:2974.

[15326] Another function of VGAM263 is therefore inhibition of Interleukin 1 Family, Member 5 (delta) (IL1F5, Accession NM_012275), a gene which is a novel interleukin-1 receptor antagonist gene. Accordingly, utilities of VGAM263 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1F5. The function of IL1F5 has been established by previous studies. The cy-

tokine interleukin-1 (IL1; OMIM Ref. No. 147760) elicits a wide array of biologic activities that initiate and promote the host response to injury or infection by activating a set of transcription factors, including NFkB (see OMIM Ref. No. 164011) and AP1 (see OMIM Ref. No. 165160), which in turn induce production of effectors of the inflammatory response. Using a high-throughput cDNA screening technology and BLAST searching, followed by additional library screenings, RT-PCR, and 5-prime RACE analysis, Mulero et al. (1999) isolated a cDNA encoding a novel member of the interleukin-1 family, which they termed IL1HY1. The deduced 155-amino acid protein shares 52% sequence identity with IL1RA (OMIM Ref. No. 147679). It contains 3 of 4 highly conserved cysteine residues and an aspartate at position 148, which is cognate to asp145 in IL1B (OMIM Ref. No. 147720), and has been shown to impart agonist activity to IL1B. It does not contain a signal peptide or a prodomain. PCR analysis revealed expression in leukocytes, spleen, and brain as well as in fetal brain and most abundantly in a fetal skin library. RT-PCR analysis also established that IL1HY1 expression is amplified in a stimulated macrophage cell line. By EST database searching, Smith et al. (2000) also identified a cDNA encoding

IL1HY1, which they termed FIL1–delta. Modeling indicated that IL1HY1 has a conserved 12–stranded beta–trefoil structure. Binding analysis detected no interaction with multiple IL1R family members.

[15327] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15328] Busfield, S. J.; Comrack, C. A.; Yu, G.; Chickering, T. W.; Smutko, J. S.; Zhou, H.; Leiby, K. R.; Holmgren, L. M.; Gearing, D. P.; Pan, Y. : Identification and gene organization of three novel members of the IL–1 family on human chromosome 2. *Genomics* 66: 213–216, 2000. ; and

[15329] Mulero, J. J.; Pace, A. M.; Nelken, S. T.; Loeb, D. B.; Correa, T. R.; Drmanac, R.; Ford, J. E. : IL1HY1: a novel interleukin–1 receptor antagonist gene. *Biochem. Biophys. Res. Commun.*

[15330] Further studies establishing the function and utilities of IL1F5 are found in John Hopkins OMIM database record ID 605507, and in cited publications numbered 4500–450 and 4493 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 9 (SERPINB9, Accession NM_004155) is another

VGAM263 host target gene. SERPINB9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SERPINB9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERPINB9 BINDING SITE, designated SEQ ID:10360, to the nucleotide sequence of VGAM263 RNA, herein designated VGAM RNA, also designated SEQ ID:2974.

[15331] Another function of VGAM263 is therefore inhibition of Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 9 (SERPINB9, Accession NM_004155), a gene which may be a serpin serine protease inhibitor that interacts with granzyme B (GZMB). Accordingly, utilities of VGAM263 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINB9. The function of SERPINB9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM60.RI58 (Accession NM_012420) is another VGAM263 host target gene. RI58 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RI58, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RI58 BINDING SITE, designated SEQ ID:14792, to the nucleotide sequence of VGAM263 RNA, herein designated VGAM RNA, also designated SEQ ID:2974.

[15332] Another function of VGAM263 is therefore inhibition of RI58 (Accession NM_012420). Accordingly, utilities of VGAM263 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RI58. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 264 (VGAM264) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15333] VGAM264 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM264 was detected is described hereinabove with reference to Figs. 1–8.

[15334] VGAM264 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM264 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[15335] VGAM264 gene encodes a VGAM264 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM264 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM264 precursor RNA is designated SEQ ID:250, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:250 is located at position 45887 relative to the genome of Calitrichine Herpesvirus 3.

[15336] VGAM264 precursor RNA folds onto itself, forming VGAM264 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15337] An enzyme complex designated DICER COMPLEX, `dices` the VGAM264 folded precursor RNA into VGAM264 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM264 RNA is designated SEQ ID:2975, and is provided hereinbelow with reference to the sequence listing part.

[15338] VGAM264 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM264 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM264 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15339] VGAM264 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM264 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM264 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM264 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM264 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15340] The complementary binding of VGAM264 RNA, herein designated VGAM RNA, to host target binding sites on VGAM264 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM264 host target RNA into VGAM264 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[15341] It is appreciated that VGAM264 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM264 host target genes. The mRNA of each one of this plurality of VGAM264 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM264 RNA, herein designated VGAM RNA, and which when bound by VGAM264 RNA causes inhibition of translation of respective one or more VGAM264 host target proteins.

[15342] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM264 gene, herein designated VGAM GENE, on one or more VGAM264 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15343] It is yet further appreciated that a function of VGAM264 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM264 correlate with, and may be deduced from, the identity of the host target genes which VGAM264 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15344] Nucleotide sequences of the VGAM264 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM264 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM264 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM264 are further described hereinbelow with reference to Table 1.

[15345] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM264 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM264 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15346] As mentioned hereinabove with reference to Fig. 1, a function of VGAM264 gene, herein designated VGAM is inhibition of expression of VGAM264 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM264 correlate with, and may be deduced from, the identity of the target genes which VGAM264 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15347] A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis factor, alpha, converting enzyme) (ADAM17, Accession NM_003183) is a VGAM264 host target gene. ADAM17 BINDING SITE1 and ADAM17 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADAM17, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM17 BIND-

ING SITE1 and ADAM17 BINDING SITE2, designated SEQ ID:9156 and SEQ ID:22409 respectively, to the nucleotide sequence of VGAM264 RNA, herein designated VGAM RNA, also designated SEQ ID:2975.

[15348] A function of VGAM264 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 17 (tumor necrosis factor, alpha, converting enzyme) (ADAM17, Accession NM_003183), a gene which member of ADAM family of zinc metalloproteases. Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM17. The function of ADAM17 has been established by previous studies. Black et al. (1997) cloned a human cDNA encoding ADAM17, which they called TACE. The gene encodes an 824-amino acid polypeptide containing the features of the ADAM family: a secretory signal sequence, a disintegrin domain, and a metalloprotease domain. Expression studies showed that the encoded protein cleaves precursor tumor necrosis factor-alpha (TNFA; 191160) to its mature form. Northern blot analysis revealed that the gene was expressed as a 5-kb mRNA in all tissues examined. Black et al. (1997) generated mouse T cells with a homozygous deficiency in the TACE gene; these cells

showed an 80 to 90% reduction in the release of TNFA. Yamazaki et al. (1998) used PCR of a backcross panel to map the mouse Tace gene to the proximal arm of chromosome 12. Hirohata et al. (1998) used radiation hybrids to map ADAM17 to human chromosome 2p25. Animal model experiments lend further support to the function of ADAM17. Peschon et al. (1998) found that mice lacking the zinc-binding domain of Tace died in utero after embryonic day 17.5 or failed to survive beyond 1 week of age.

[15349] It is appreciated that the abovementioned animal model for ADAM17 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[15350] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15351] Black, R. A.; Rauch, C. T.; Kozlosky, C. J.; Peschon, J. J.; Slack, J. L.; Wolfson, M. F.; Castner, B. J.; Stocking, K. L.; Reddy, P.; Srinivasan, S.; Nelson, N.; Boiani, N.; Schooley, K. A.; Gerhart, M.; Davis, R.; Fitzner, J. N.; Johnson, R. S.; Paxton, R. J.; March, C. J.; Cerretti, D. P. : A metalloproteinase disintegrin that releases tumour-necrosis factor-

alpha from cells. Nature 385: 729–733, 1997. ; and

[15352] Peschon, J. J.; Slack, J. L.; Reddy, P.; Stocking, K. L.; Sunnarborg, S. W.; Lee, D. C.; Russell, W. E.; Castner, B. J.; Johnson, R. S.; Fitzner, J. N.; Boyce, R. W.; Nelson, N.; Kozlosk.

[15353] Further studies establishing the function and utilities of ADAM17 are found in John Hopkins OMIM database record ID 603639, and in cited publications numbered 7990, 7991–7992, 276 and 7993–7995 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Phosphatase 2, Regulatory Subunit B (B56), Beta Isoform (PPP2R5B, Accession NM_006244) is another VGAM264 host target gene. PPP2R5B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP2R5B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2R5B BINDING SITE, designated SEQ ID:12915, to the nucleotide sequence of VGAM264 RNA, herein designated VGAM RNA, also designated SEQ ID:2975.

[15354] Another function of VGAM264 is therefore inhibition of

Protein Phosphatase 2, Regulatory Subunit B (B56), Beta Isoform (PPP2R5B, Accession NM_006244), a gene which is a regulatory subunit of protein phosphatase 2A. Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R5B. The function of PPP2R5B has been established by previous studies. Protein phosphorylation is a regulatory mechanism commonly employed in cellular processes such as cell cycle progression, growth factor signaling, and cell transformation. Protein phosphatase 2A (PP2A), a heterotrimeric serine/threonine phosphatase, has been implicated in a variety of regulatory processes including cell growth and division, muscle contraction, and gene transcription. PP2A is a trimeric enzyme composed of a catalytic subunit (OMIM Ref. No. 176915), a structural subunit, and any of several different regulatory subunits which control its specificity. One family of related PP2A regulatory subunits is designated the B56 family and contains at least 5 different members (McCright and Virshup (1995)). The beta, delta (OMIM Ref. No. 601646), and epsilon (OMIM Ref. No. 601647) subunits are expressed at highest levels in the brain and the expression of the beta and delta subunits increases when

neuroblastoma cells are induced to differentiate with retinoic acid. See also the alpha subunit (OMIM Ref. No. 601643). McCright et al. (1996) mapped the gene for the beta subunit, designated PPP2R5B, to 11q12 by fluorescence in situ hybridization. The European Consortium on MEN1 (1997) localized the PPP2R5B gene to 11q13 in the course of constructing a contig of the region containing the MEN1 gene (OMIM Ref. No. 131100).

[15355] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15356] McCright, B.; Brothman, A. R.; Virshup, D. M. : Assignment of human protein phosphatase 2A regulatory subunit genes B56-alpha, B56-beta, B56-gamma, B56-delta, and B56-epsilon (PPP2R5A--PPP2R5E), highly expressed in muscle and brain, to chromosome regions 1q41, 11q12, 3p21, 6p21.1, and 7p11.2-to-p12. Genomics 36: 168-170, 1996. ; and

[15357] McCright, B.; Virshup, D. M. : Identification of a new family of protein phosphatase 2A regulatory subunits. J. Biol. Chem. 270: 26123-26128, 1995.

[15358] Further studies establishing the function and utilities of PPP2R5B are found in John Hopkins OMIM database record

ID 601644, and in cited publications numbered 648 and 6687–6688 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Arginine–glutamic Acid Dipeptide (RE) Repeats (RERE, Accession NM_012102) is another VGAM264 host target gene. RERE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RERE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RERE BINDING SITE, designated SEQ ID:14410, to the nucleotide sequence of VGAM264 RNA, herein designated VGAM RNA, also designated SEQ ID:2975.

[15359] Another function of VGAM264 is therefore inhibition of Arginine–glutamic Acid Dipeptide (RE) Repeats (RERE, Accession NM_012102), a gene which binds DRPLA and locates in the nucleus. Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RERE. The function of RERE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM51. Sodium Channel, Voltage–gated, Type IV, Alpha Polypeptide

(SCN4A, Accession NM_000334) is another VGAM264 host target gene. SCN4A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCN4A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCN4A BINDING SITE, designated SEQ ID:5890, to the nucleotide sequence of VGAM264 RNA, herein designated VGAM RNA, also designated SEQ ID:2975.

[15360] Another function of VGAM264 is therefore inhibition of Sodium Channel, Voltage-gated, Type IV, Alpha Polypeptide (SCN4A, Accession NM_000334). Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN4A. Thrombospondin 1 (THBS1, Accession NM_003246) is another VGAM264 host target gene. THBS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by THBS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THBS1 BINDING SITE, designated SEQ ID:9256, to the nucleotide se-

quence of VGAM264 RNA, herein designated VGAM RNA, also designated SEQ ID:2975.

[15361] Another function of VGAM264 is therefore inhibition of Thrombospondin 1 (THBS1, Accession NM_003246), a gene which is a member of a family of adhesive molecules, involves in blood clotting and in angiogenesis. Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THBS1. The function of THBS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM20. Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM_017575) is another VGAM264 host target gene. C17orf31 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C17orf31, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C17orf31 BINDING SITE, designated SEQ ID:18998, to the nucleotide sequence of VGAM264 RNA, herein designated VGAM RNA, also designated SEQ ID:2975.

[15362] Another function of VGAM264 is therefore inhibition of

Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM_017575). Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C17orf31. CGI-96 (Accession NM_015703) is another VGAM264 host target gene. CGI-96 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CGI-96, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGI-96 BINDING SITE, designated SEQ ID:17926, to the nucleotide sequence of VGAM264 RNA, herein designated VGAM RNA, also designated SEQ ID:2975.

[15363] Another function of VGAM264 is therefore inhibition of CGI-96 (Accession NM_015703). Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGI-96. DRIL2 (Accession NM_006465) is another VGAM264 host target gene. DRIL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DRIL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of DRIL2 BINDING SITE, designated SEQ ID:13184, to the nucleotide sequence of VGAM264 RNA, herein designated VGAM RNA, also designated SEQ ID:2975.

[15364] Another function of VGAM264 is therefore inhibition of DRIL2 (Accession NM_006465). Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRIL2. FLJ14957 (Accession NM_032866) is another VGAM264 host target gene. FLJ14957 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14957 BINDING SITE, designated SEQ ID:26680, to the nucleotide sequence of VGAM264 RNA, herein designated VGAM RNA, also designated SEQ ID:2975.

[15365] Another function of VGAM264 is therefore inhibition of FLJ14957 (Accession NM_032866). Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14957.

KIAA1056 (Accession NM_014894) is another VGAM264 host target gene. KIAA1056 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1056 BINDING SITE, designated SEQ ID:17050, to the nucleotide sequence of VGAM264 RNA, herein designated VGAM RNA, also designated SEQ ID:2975.

[15366] Another function of VGAM264 is therefore inhibition of KIAA1056 (Accession NM_014894). Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1056. KIAA1323 (Accession XM_032146) is another VGAM264 host target gene. KIAA1323 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1323 BINDING SITE, designated SEQ ID:31567, to the nucleotide sequence of VGAM264 RNA, herein designated

VGAM RNA, also designated SEQ ID:2975.

[15367] Another function of VGAM264 is therefore inhibition of KIAA1323 (Accession XM_032146). Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1323. LANO (Accession NM_018214) is another VGAM264 host target gene. LANO BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LANO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LANO BINDING SITE, designated SEQ ID:20130, to the nucleotide sequence of VGAM264 RNA, herein designated VGAM RNA, also designated SEQ ID:2975.

[15368] Another function of VGAM264 is therefore inhibition of LANO (Accession NM_018214). Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LANO. MGC3101 (Accession NM_024043) is another VGAM264 host target gene. MGC3101 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC3101, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3101 BINDING SITE, designated SEQ ID:23478, to the nucleotide sequence of VGAM264 RNA, herein designated VGAM RNA, also designated SEQ ID:2975.

[15369] Another function of VGAM264 is therefore inhibition of MGC3101 (Accession NM_024043). Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3101. Ring Finger Protein 24 (RNF24, Accession NM_007219) is another VGAM264 host target gene. RNF24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF24 BINDING SITE, designated SEQ ID:14088, to the nucleotide sequence of VGAM264 RNA, herein designated VGAM RNA, also designated SEQ ID:2975.

[15370] Another function of VGAM264 is therefore inhibition of Ring Finger Protein 24 (RNF24, Accession NM_007219).

Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF24. LOC123346 (Accession XM_063609) is another VGAM264 host target gene. LOC123346 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC123346, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123346 BINDING SITE, designated SEQ ID:37250, to the nucleotide sequence of VGAM264 RNA, herein designated VGAM RNA, also designated SEQ ID:2975.

[15371] Another function of VGAM264 is therefore inhibition of LOC123346 (Accession XM_063609). Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123346. LOC148932 (Accession XM_086372) is another VGAM264 host target gene. LOC148932 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC148932 BINDING SITE, designated SEQ ID:38626, to the nucleotide sequence of VGAM264 RNA, herein designated VGAM RNA, also designated SEQ ID:2975.

[15372] Another function of VGAM264 is therefore inhibition of LOC148932 (Accession XM_086372). Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148932. LOC150139 (Accession XM_086794) is another VGAM264 host target gene. LOC150139 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150139 BINDING SITE, designated SEQ ID:38861, to the nucleotide sequence of VGAM264 RNA, herein designated VGAM RNA, also designated SEQ ID:2975.

[15373] Another function of VGAM264 is therefore inhibition of LOC150139 (Accession XM_086794). Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150139. LOC150397 (Accession XM_086907) is an-

other VGAM264 host target gene. LOC150397 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150397 BINDING SITE, designated SEQ ID:38961, to the nucleotide sequence of VGAM264 RNA, herein designated VGAM RNA, also designated SEQ ID:2975.

[15374] Another function of VGAM264 is therefore inhibition of LOC150397 (Accession XM_086907). Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150397. LOC152502 (Accession XM_001389) is another VGAM264 host target gene. LOC152502 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152502, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152502 BINDING SITE, designated SEQ ID:29835, to the nucleotide sequence of VGAM264 RNA, herein designated VGAM RNA, also designated SEQ ID:2975.

[15375] Another function of VGAM264 is therefore inhibition of LOC152502 (Accession XM_001389). Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152502. LOC51667 (Accession NM_016118) is another VGAM264 host target gene. LOC51667 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51667, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51667 BINDING SITE, designated SEQ ID:18200, to the nucleotide sequence of VGAM264 RNA, herein designated VGAM RNA, also designated SEQ ID:2975.

[15376] Another function of VGAM264 is therefore inhibition of LOC51667 (Accession NM_016118). Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51667. LOC91695 (Accession XM_040084) is another VGAM264 host target gene. LOC91695 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91695, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91695 BINDING SITE, designated SEQ ID:33253, to the nucleotide sequence of VGAM264 RNA, herein designated VGAM RNA, also designated SEQ ID:2975.

[15377] Another function of VGAM264 is therefore inhibition of LOC91695 (Accession XM_040084). Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91695. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 265 (VGAM265) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15378] VGAM265 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM265 was detected is described hereinabove with reference to Figs. 1–8.

[15379] VGAM265 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM265 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[15380] VGAM265 gene encodes a VGAM265 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM265 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM265 precursor RNA is designated SEQ ID:251, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:251 is located at position 60938 relative to the genome of Calitrichine Herpesvirus 3.

[15381] VGAM265 precursor RNA folds onto itself, forming VGAM265 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15382] An enzyme complex designated DICER COMPLEX, `dices` the VGAM265 folded precursor RNA into VGAM265 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM265 RNA is designated SEQ ID:2976, and is provided hereinbelow with reference to the sequence listing part.

[15383] VGAM265 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM265 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM265 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15384] VGAM265 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM265 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM265 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM265 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM265 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15385] The complementary binding of VGAM265 RNA, herein designated VGAM RNA, to host target binding sites on VGAM265 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM265 host target RNA into VGAM265 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[15386] It is appreciated that VGAM265 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM265 host target genes. The mRNA of each one of this plurality of VGAM265 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM265 RNA, herein designated VGAM RNA, and which when bound by VGAM265 RNA causes inhibition of translation of respective one or more VGAM265 host target proteins.

[15387] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM265 gene, herein designated VGAM GENE, on one or more VGAM265 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15388] It is yet further appreciated that a function of VGAM265 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM265 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM265 correlate with, and may be deduced from, the identity of the host target genes which VGAM265 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15389] Nucleotide sequences of the VGAM265 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM265 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM265 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM265 are further described hereinbelow with reference to Table 1.

[15390] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM265 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM265 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15391] As mentioned hereinabove with reference to Fig. 1, a function of VGAM265 gene, herein designated VGAM is inhibition of expression of VGAM265 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM265 correlate with, and may be deduced from, the identity of the target genes which VGAM265 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15392] Epithelial V-like Antigen 1 (EVA1, Accession NM_005797) is a VGAM265 host target gene. EVA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EVA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVA1 BINDING SITE, designated SEQ ID:12378, to the nucleotide sequence of VGAM265 RNA, herein designated VGAM RNA,

also designated SEQ ID:2976.

[15393] A function of VGAM265 is therefore inhibition of Epithelial V-like Antigen 1 (EVA1, Accession NM_005797). Accordingly, utilities of VGAM265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVA1. KIAA0630 (Accession XM_114729) is another VGAM265 host target gene. KIAA0630 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0630, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0630 BINDING SITE, designated SEQ ID:43065, to the nucleotide sequence of VGAM265 RNA, herein designated VGAM RNA, also designated SEQ ID:2976.

[15394] Another function of VGAM265 is therefore inhibition of KIAA0630 (Accession XM_114729). Accordingly, utilities of VGAM265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0630. PRO1598 (Accession NM_018503) is another VGAM265 host target gene. PRO1598 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO1598, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1598 BINDING SITE, designated SEQ ID:20569, to the nucleotide sequence of VGAM265 RNA, herein designated VGAM RNA, also designated SEQ ID:2976.

[15395] Another function of VGAM265 is therefore inhibition of PRO1598 (Accession NM_018503). Accordingly, utilities of VGAM265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1598. Squamous Cell Carcinoma Antigen Recognised By T Cells 3 (SART3, Accession NM_014706) is another VGAM265 host target gene. SART3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SART3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SART3 BINDING SITE, designated SEQ ID:16248, to the nucleotide sequence of VGAM265 RNA, herein designated VGAM RNA, also designated SEQ ID:2976.

[15396] Another function of VGAM265 is therefore inhibition of Squamous Cell Carcinoma Antigen Recognised By T Cells

3 (SART3, Accession NM_014706). Accordingly, utilities of VGAM265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SART3. LOC158450 (Accession XM_088580) is another VGAM265 host target gene. LOC158450 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158450 BINDING SITE, designated SEQ ID:39846, to the nucleotide sequence of VGAM265 RNA, herein designated VGAM RNA, also designated SEQ ID:2976.

[15397] Another function of VGAM265 is therefore inhibition of LOC158450 (Accession XM_088580). Accordingly, utilities of VGAM265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158450. LOC158504 (Accession XM_088591) is another VGAM265 host target gene. LOC158504 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158504, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC158504 BINDING SITE, designated SEQ ID:39857, to the nucleotide sequence of VGAM265 RNA, herein designated VGAM RNA, also designated SEQ ID:2976.

[15398] Another function of VGAM265 is therefore inhibition of LOC158504 (Accession XM_088591). Accordingly, utilities of VGAM265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158504. LOC196812 (Accession XM_116868) is another VGAM265 host target gene. LOC196812 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196812, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196812 BINDING SITE, designated SEQ ID:43136, to the nucleotide sequence of VGAM265 RNA, herein designated VGAM RNA, also designated SEQ ID:2976.

[15399] Another function of VGAM265 is therefore inhibition of LOC196812 (Accession XM_116868). Accordingly, utilities of VGAM265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196812. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 266 (VGAM266) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15400] VGAM266 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM266 was detected is described hereinabove with reference to Figs. 1–8.

[15401] VGAM266 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM266 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15402] VGAM266 gene encodes a VGAM266 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM266 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM266 precursor RNA is designated SEQ ID:252, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:252 is

located at position 4402 relative to the genome of Epi-
phyas Postvittana Nucleopolyhedrovirus.

[15403] VGAM266 precursor RNA folds onto itself, forming VGAM266 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15404] An enzyme complex designated DICER COMPLEX, `dices` the VGAM266 folded precursor RNA into VGAM266 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM266 RNA is designated SEQ ID:2977, and is provided hereinbelow with reference to the sequence listing part.

[15405] VGAM266 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM266 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM266 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[15406] VGAM266 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM266 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM266 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM266 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM266 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[15407] The complementary binding of VGAM266 RNA, herein designated VGAM RNA, to host target binding sites on VGAM266 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM266 host target RNA into VGAM266 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15408] It is appreciated that VGAM266 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM266 host target genes. The mRNA of each one of this plurality of VGAM266 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM266 RNA, herein designated VGAM RNA, and which when bound by VGAM266 RNA causes inhibition of translation of respective one or more VGAM266

host target proteins.

[15409] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM266 gene, herein designated VGAM GENE, on one or more VGAM266 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15410] It is yet further appreciated that a function of VGAM266 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM266 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucle-

opolyhedrovirus. Specific functions, and accordingly utilities, of VGAM266 correlate with, and may be deduced from, the identity of the host target genes which VGAM266 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15411] Nucleotide sequences of the VGAM266 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM266 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM266 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM266 are further described hereinbelow with reference to Table 1.

[15412] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM266 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM266 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15413] As mentioned hereinabove with reference to Fig. 1, a function of VGAM266 gene, herein designated VGAM is inhibition of expression of VGAM266 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM266 correlate with, and may be deduced from, the identity of the target genes which VGAM266 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15414] Calbindin 1, 28kDa (CALB1, Accession NM_004929) is a VGAM266 host target gene. CALB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALB1 BINDING SITE, designated SEQ ID:11367, to the nucleotide sequence of VGAM266 RNA, herein designated VGAM RNA, also designated SEQ ID:2977.

[15415] A function of VGAM266 is therefore inhibition of Calbindin 1, 28kDa (CALB1, Accession NM_004929), a gene which buffers cytosolic calcium. Accordingly, utilities of VGAM266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALB1. The function of CALB1 has been established by previous studies. Calbindin is a calcium-binding protein belonging to the troponin C superfamily (see OMIM Ref. No. 191040). It was originally described as a 27-kD protein

induced by vitamin D in the duodenum of the chick. Calbindin immunoreactivity was further detected by radioimmunoassay and immunohistochemistry in the kidney, pancreatic islets, and brain. In the brain, its synthesis is independent of vitamin-D-derived hormones. Two different proteins presenting calbindin immunoreactivity, one of molecular mass 27 kD (now known to be 28 kD) and the other of 29 kD (OMIM Ref. No. 114051), were identified in the central nervous system. Both molecular species are present in the brain of all vertebrates except fish. Parmentier et al. (1987) selected human 28-kD calbindin cDNA clones by antibody screening of lambda-gt11 brain libraries. The sequence showed an open reading frame coding for a protein of 261 amino acids, containing 4 active calcium-binding domains, and 2 modified domains that presumably have lost their calcium-binding capacity. The preliminary data suggested that the 29-kD protein in brain is encoded by a different gene. By means of immunohistochemical methods, Seto-Ohshima et al. (1988) demonstrated a dearth of neurons containing calbindin in the brains of patients with Huntington disease. Calbindin depletion was particularly notable in the neostriatum (caudate nucleus and putamen) of these patients. Parmen-

tier and Vassart (1988) described a HindIII RFLP of the calbindin 28-kilodalton gene. Parmentier et al. (1989) cloned and sequenced the 5-prime and 3-prime regions of the calbindin 28-kD gene and assigned it to chromosome 8 using human-rodent hybrid cell lines. By Southern analysis of somatic cell hybrids and in situ hybridization, Modi et al. (1991) assigned the CALB1 gene to 8p12-q11.2 Parmentier et al. (1991) mapped the CALB1 gene to 8q21.3-q22.1 by in situ hybridization. At the same time, they mapped the CALB2 gene, called by them calretinin, to 16q22-q23, also by in situ hybridization. These localizations matched the chromosomal regions where the carbonic anhydrase isozyme gene cluster (CA1, 114800; CA2, 259730; CA3, 114750) and the related gene CA7 (OMIM Ref. No. 114770) have been mapped, respectively. This suggests that in evolution a common duplication of the calbindin/calretinin and carbonic anhydrase ancestral genes occurred. By computer-assisted analysis of 5 BAC clones and an EST sequence, Tauchi et al. (1999) defined the genomic organization of an 800-kb region on chromosome 8q21 as 5-prime C8ORF1 (OMIM Ref. No. 604598), 3-prime NBS1, 5-prime DECR1 (OMIM Ref. No. 222745), and 3-prime CALB1.

[15416] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15417] Parmentier, M.; Lawson, D. E. M.; Vassart, G. : Human 27-kDa calbindin complementary DNA sequence: evolutionary and functional implications. *Europ. J. Biochem.* 170: 207–215, 1987. ; and

[15418] Seto-Ohshima, A.; Emson, P. C.; Lawson, E.; Mountjoy, C. Q.; Carrasco, L. H. : Loss of matrix calcium-binding protein-containing neurons in Huntington's disease. *Lancet* I: 1252–1254, 198.

[15419] Further studies establishing the function and utilities of CALB1 are found in John Hopkins OMIM database record ID 114050, and in cited publications numbered 1917–192 and 3271 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Heterogeneous Nuclear Ribonucleoprotein D-like (HNRPDL, Accession NM_005463) is another VGAM266 host target gene. HNRPDL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HNRPDL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of HNRPDL BINDING SITE, designated SEQ ID:11947, to the nucleotide sequence of VGAM266 RNA, herein designated VGAM RNA, also designated SEQ ID:2977.

[15420] Another function of VGAM266 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein D-like (HNRPDL, Accession NM_005463), a gene which binds to rna molecules that contain au-rich elements. Accordingly, utilities of VGAM266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPDL. The function of HNRPDL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM144. Interleukin 24 (IL24, Accession NM_006850) is another VGAM266 host target gene. IL24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL24 BINDING SITE, designated SEQ ID:13718, to the nucleotide sequence of VGAM266 RNA, herein designated VGAM RNA, also designated SEQ ID:2977.

[15421] Another function of VGAM266 is therefore inhibition of Interleukin 24 (IL24, Accession NM_006850), a gene which may contribute to terminal cell differentiation. Accordingly, utilities of VGAM266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL24. The function of IL24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM258. Solute Carrier Family 10 (sodium/bile acid cotransporter family), Member 2 (SLC10A2, Accession NM_000452) is another VGAM266 host target gene. SLC10A2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC10A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC10A2 BINDING SITE, designated SEQ ID:6060, to the nucleotide sequence of VGAM266 RNA, herein designated VGAM RNA, also designated SEQ ID:2977.

[15422] Another function of VGAM266 is therefore inhibition of Solute Carrier Family 10 (sodium/bile acid cotransporter family), Member 2 (SLC10A2, Accession NM_000452). Ac-

cordingly, utilities of VGAM266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC10A2. Transcription Factor 7 (T-cell specific, HMG-box) (TCF7, Accession NM_003202) is another VGAM266 host target gene. TCF7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF7 BINDING SITE, designated SEQ ID:9191, to the nucleotide sequence of VGAM266 RNA, herein designated VGAM RNA, also designated SEQ ID:2977.

[15423] Another function of VGAM266 is therefore inhibition of Transcription Factor 7 (T-cell specific, HMG-box) (TCF7, Accession NM_003202). Accordingly, utilities of VGAM266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF7. DKFZP434P0111 (Accession XM_041116) is another VGAM266 host target gene. DKFZP434P0111 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434P0111, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P0111 BINDING SITE, designated SEQ ID:33452, to the nucleotide sequence of VGAM266 RNA, herein designated VGAM RNA, also designated SEQ ID:2977.

[15424] Another function of VGAM266 is therefore inhibition of DKFZP434P0111 (Accession XM_041116). Accordingly, utilities of VGAM266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P0111. KIAA0495 (Accession XM_031397) is another VGAM266 host target gene. KIAA0495 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0495 BINDING SITE, designated SEQ ID:31358, to the nucleotide sequence of VGAM266 RNA, herein designated VGAM RNA, also designated SEQ ID:2977.

[15425] Another function of VGAM266 is therefore inhibition of KIAA0495 (Accession XM_031397). Accordingly, utilities of VGAM266 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0495. LOC139221 (Accession XM_066558) is another VGAM266 host target gene. LOC139221 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC139221, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139221 BINDING SITE, designated SEQ ID:37330, to the nucleotide sequence of VGAM266 RNA, herein designated VGAM RNA, also designated SEQ ID:2977.

[15426] Another function of VGAM266 is therefore inhibition of LOC139221 (Accession XM_066558). Accordingly, utilities of VGAM266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139221. LOC257482 (Accession XM_168544) is another VGAM266 host target gene. LOC257482 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC257482, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257482 BINDING SITE, designated SEQ ID:45232, to

the nucleotide sequence of VGAM266 RNA, herein designated VGAM RNA, also designated SEQ ID:2977.

[15427] Another function of VGAM266 is therefore inhibition of LOC257482 (Accession XM_168544). Accordingly, utilities of VGAM266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257482. LOC90346 (Accession NM_138351) is another VGAM266 host target gene. LOC90346 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90346, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90346 BINDING SITE, designated SEQ ID:28746, to the nucleotide sequence of VGAM266 RNA, herein designated VGAM RNA, also designated SEQ ID:2977.

[15428] Another function of VGAM266 is therefore inhibition of LOC90346 (Accession NM_138351). Accordingly, utilities of VGAM266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90346. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 267 (VGAM267) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15429] VGAM267 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM267 was detected is described hereinabove with reference to Figs. 1–8.

[15430] VGAM267 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM267 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15431] VGAM267 gene encodes a VGAM267 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM267 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM267 precursor RNA is designated SEQ ID:253, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:253 is located at position 87252 relative to the genome of Epiphyas Postvittana Nucleopolyhedrovirus.

[15432] VGAM267 precursor RNA folds onto itself, forming VGAM267 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15433] An enzyme complex designated DICER COMPLEX, `dices` the VGAM267 folded precursor RNA into VGAM267 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM267 RNA is designated SEQ ID:2978, and is provided hereinbelow with reference to the sequence listing part.

[15434] VGAM267 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM267 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM267 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15435] VGAM267 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM267 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM267 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM267 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM267 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15436] The complementary binding of VGAM267 RNA, herein designated VGAM RNA, to host target binding sites on VGAM267 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM267 host target RNA into VGAM267 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15437] It is appreciated that VGAM267 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM267 host target genes. The mRNA of each one of this plurality of VGAM267 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM267 RNA, herein designated VGAM RNA, and which when bound by VGAM267 RNA causes inhibition of translation of respective one or more VGAM267 host target proteins.

[15438] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM267 gene, herein designated VGAM GENE, on one or more VGAM267 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15439] It is yet further appreciated that a function of VGAM267 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM267 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM267 correlate with, and may be deduced

from, the identity of the host target genes which VGAM267 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15440] Nucleotide sequences of the VGAM267 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM267 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM267 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM267 are further described hereinbelow with reference to Table 1.

[15441] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM267 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM267 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15442] As mentioned hereinabove with reference to Fig. 1, a function of VGAM267 gene, herein designated VGAM is inhibition of expression of VGAM267 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM267 correlate with, and may be deduced from, the identity of the target genes which VGAM267

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15443] ATPase, Na⁺/K⁺ Transporting, Beta 2 Polypeptide (ATP1B2, Accession NM_001678) is a VGAM267 host target gene. ATP1B2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP1B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1B2 BINDING SITE, designated SEQ ID:7388, to the nucleotide sequence of VGAM267 RNA, herein designated VGAM RNA, also designated SEQ ID:2978.

[15444] A function of VGAM267 is therefore inhibition of ATPase, Na⁺/K⁺ Transporting, Beta 2 Polypeptide (ATP1B2, Accession NM_001678), a gene which catalyzes the hydrolysis of ATP coupled with the exchange of Na⁺/K⁺ ions across the plasma membrane. Accordingly, utilities of VGAM267 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1B2. The function of ATP1B2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM152.KIAA0711 (Accession NM_014867) is another VGAM267 host target gene. KIAA0711 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0711 BINDING SITE, designated SEQ ID:16957, to the nucleotide sequence of VGAM267 RNA, herein designated VGAM RNA, also designated SEQ ID:2978.

[15445] Another function of VGAM267 is therefore inhibition of KIAA0711 (Accession NM_014867). Accordingly, utilities of VGAM267 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0711. RDC1 (Accession XM_051522) is another VGAM267 host target gene. RDC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RDC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RDC1 BINDING SITE, designated SEQ ID:35847, to the nucleotide sequence of VGAM267 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2978.

[15446] Another function of VGAM267 is therefore inhibition of RDC1 (Accession XM_051522). Accordingly, utilities of VGAM267 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RDC1. Vav 3 Oncogene (VAV3, Accession NM_006113) is another VGAM267 host target gene. VAV3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VAV3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VAV3 BINDING SITE, designated SEQ ID:12756, to the nucleotide sequence of VGAM267 RNA, herein designated VGAM RNA, also designated SEQ ID:2978.

[15447] Another function of VGAM267 is therefore inhibition of Vav 3 Oncogene (VAV3, Accession NM_006113). Accordingly, utilities of VGAM267 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VAV3. LOC147837 (Accession XM_085915) is another VGAM267 host target gene. LOC147837 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147837, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147837 BINDING SITE, designated SEQ ID:38390, to the nucleotide sequence of VGAM267 RNA, herein designated VGAM RNA, also designated SEQ ID:2978.

[15448] Another function of VGAM267 is therefore inhibition of LOC147837 (Accession XM_085915). Accordingly, utilities of VGAM267 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147837. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 268 (VGAM268) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15449] VGAM268 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM268 was detected is described hereinabove with reference to Figs. 1–8.

[15450] VGAM268 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana

Nucleopolyhedrovirus. VGAM268 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15451] VGAM268 gene encodes a VGAM268 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM268 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM268 precursor RNA is designated SEQ ID:254, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:254 is located at position 84311 relative to the genome of Epiphyas Postvittana Nucleopolyhedrovirus.

[15452] VGAM268 precursor RNA folds onto itself, forming VGAM268 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15453] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM268 folded precursor RNA into VGAM268 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 68%) nucleotide sequence of VGAM268 RNA is designated SEQ ID:2979, and is provided hereinbelow with reference to the sequence listing part.

[15454] VGAM268 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM268 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM268 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15455] VGAM268 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM268 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM268 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM268 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM268 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15456] The complementary binding of VGAM268 RNA, herein designated VGAM RNA, to host target binding sites on VGAM268 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM268 host target RNA into VGAM268 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15457] It is appreciated that VGAM268 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM268 host target genes. The mRNA of each one of this plurality of VGAM268 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM268 RNA, herein designated VGAM RNA, and which when bound by VGAM268 RNA causes inhibition of translation of respective one or more VGAM268 host target proteins.

[15458] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM268 gene, herein designated VGAM GENE, on one or more VGAM268 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15459] It is yet further appreciated that a function of VGAM268 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM268 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM268 correlate with, and may be deduced from, the identity of the host target genes which VGAM268 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15460] Nucleotide sequences of the VGAM268 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM268 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM268 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM268 are further described hereinbelow with reference to Table 1.

[15461] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM268 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM268 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15462] As mentioned hereinabove with reference to Fig. 1, a function of VGAM268 gene, herein designated VGAM is inhibition of expression of VGAM268 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM268 correlate with, and may be deduced from, the identity of the target genes which VGAM268 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15463] Neuronal Cell Adhesion Molecule (NRCAM, Accession NM_005010) is a VGAM268 host target gene. NRCAM BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NRCAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRCAM BINDING SITE, designated SEQ ID:11449, to the

nucleotide sequence of VGAM268 RNA, herein designated VGAM RNA, also designated SEQ ID:2979.

[15464] A function of VGAM268 is therefore inhibition of Neuronal Cell Adhesion Molecule (NRCAM, Accession NM_005010), a gene which functions as a cell surface protein and belongs to the immunoglobulin superfamily. Accordingly, utilities of VGAM268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRCAM. The function of NRCAM has been established by previous studies. The cell adhesion molecules (CAMs) are a subset of the immunoglobulin (Ig) superfamily found in the nervous systems of both vertebrates and invertebrates. They are usually surface membrane proteins with multiple Ig domains at their N termini followed by several fibronectin type III repeats and either a transmembrane intracellular domain or a glycoposphatidylinositol-linked membrane anchor at the C terminus (Lane et al., 1996). The chicken Bravo/Nr-CAM was described by Grumet et al. (1991) and Kayyem et al. (1992) and shown to play a role in nervous system development. The protein interacts with other cell surface molecules of the Ig superfamily and appears to be necessary for specific pathfinding by axonal growth cones during development (Lane et al., 1996).

Lane et al. (1996) cloned the human homolog (NRCAM) of the chicken gene from a fetal brain library. Like its chicken counterpart, the predicted 1,275–amino acid protein has 6 V–like Ig domains and 5 fibronectin type III repeats. The transmembrane and intracellular domains of human and chicken NRCAM are entirely conserved and the proteins are 82% identical overall. Alternative splice variants were observed involving sequence around the fifth fibronectin repeat. Northern blots showed an approximately 7–kb transcript in all tissues of adult human brain examined.

[15465] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15466] Kayyem, J. F.; Roman, J. M.; de la Rosa, E. J.; Schwarz, U.; Dreyer, W. J. : Bravo/Nr–CAM is closely related to the cell adhesion molecules L1 and Ng–CAM and has a similar heterodimer structure. *J. Cell. Biol.* 118: 1259–1270, 1992. ; and

[15467] Lane, R. P.; Chen, X.–N.; Yamakawa, K.; Vielmetter, J.; Korenberg, J. R.; Dreyer, W. J. : Characterization of a highly conserved human homolog to the chicken neural cell surface protein.

[15468] Further studies establishing the function and utilities of

NRCAM are found in John Hopkins OMIM database record ID 601581, and in cited publications numbered 6535–6539 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP586P0123 (Accession XM_170681) is another VGAM268 host target gene. DKFZP586P0123 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP586P0123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586P0123 BINDING SITE, designated SEQ ID:45466, to the nucleotide sequence of VGAM268 RNA, herein designated VGAM RNA, also designated SEQ ID:2979.

[15469] Another function of VGAM268 is therefore inhibition of DKFZP586P0123 (Accession XM_170681). Accordingly, utilities of VGAM268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586P0123. MP1 (Accession NM_014968) is another VGAM268 host target gene. MP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MP1, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MP1 BINDING SITE, designated SEQ ID:17359, to the nucleotide sequence of VGAM268 RNA, herein designated VGAM RNA, also designated SEQ ID:2979.

[15470] Another function of VGAM268 is therefore inhibition of MP1 (Accession NM_014968). Accordingly, utilities of VGAM268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MP1. Phorbol-12-myristate-13-acetate-induced Protein 1 (PMAIP1, Accession NM_021127) is another VGAM268 host target gene. PMAIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PMAIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMAIP1 BINDING SITE, designated SEQ ID:22100, to the nucleotide sequence of VGAM268 RNA, herein designated VGAM RNA, also designated SEQ ID:2979.

[15471] Another function of VGAM268 is therefore inhibition of Phorbol-12-myristate-13-acetate-induced Protein 1

(PMAIP1, Accession NM_021127). Accordingly, utilities of VGAM268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMAIP1. Rpo1-2 (Accession NM_019014) is another VGAM268 host target gene. Rpo1-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Rpo1-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rpo1-2 BINDING SITE, designated SEQ ID:21098, to the nucleotide sequence of VGAM268 RNA, herein designated VGAM RNA, also designated SEQ ID:2979.

[15472] Another function of VGAM268 is therefore inhibition of Rpo1-2 (Accession NM_019014). Accordingly, utilities of VGAM268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rpo1-2. LOC220002 (Accession XM_166224) is another VGAM268 host target gene. LOC220002 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of LOC220002 BINDING SITE, designated SEQ ID:44048, to the nucleotide sequence of VGAM268 RNA, herein designated VGAM RNA, also designated SEQ ID:2979.

[15473] Another function of VGAM268 is therefore inhibition of LOC220002 (Accession XM_166224). Accordingly, utilities of VGAM268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220002. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 269 (VGAM269) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15474] VGAM269 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM269 was detected is described hereinabove with reference to Figs. 1–8.

[15475] VGAM269 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM269 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene

contained in the human genome.

[15476] VGAM269 gene encodes a VGAM269 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM269 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM269 precursor RNA is designated SEQ ID:255, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:255 is located at position 10259 relative to the genome of Epi-phyas Postvittana Nucleopolyhedrovirus.

[15477] VGAM269 precursor RNA folds onto itself, forming VGAM269 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15478] An enzyme complex designated DICER COMPLEX, `dices` the VGAM269 folded precursor RNA into VGAM269 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM269 RNA is designated SEQ ID:2980, and is provided hereinbelow with reference to the sequence listing part.

[15479] VGAM269 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM269 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM269 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15480] VGAM269 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM269 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM269 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM269 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM269 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15481] The complementary binding of VGAM269 RNA, herein designated VGAM RNA, to host target binding sites on VGAM269 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM269 host target RNA into VGAM269 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15482] It is appreciated that VGAM269 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM269 host target genes. The mRNA of each one of this plurality of VGAM269 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM269 RNA, herein designated VGAM RNA, and which when bound by VGAM269 RNA causes inhibition of translation of respective one or more VGAM269 host target proteins.

[15483] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM269 gene, herein designated VGAM GENE, on one or more VGAM269 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15484] It is yet further appreciated that a function of VGAM269 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM269 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM269 correlate with, and may be deduced from, the identity of the host target genes which VGAM269 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15485] Nucleotide sequences of the VGAM269 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM269 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM269 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM269 are further described hereinbelow with reference to Table 1.

[15486] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM269 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM269 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15487] As mentioned hereinabove with reference to Fig. 1, a function of VGAM269 gene, herein designated VGAM is inhibition of expression of VGAM269 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM269 correlate with, and may be deduced from, the identity of the target genes which VGAM269 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15488] Family with Sequence Similarity 8, Member A1 (FAM8A1, Accession NM_016255) is a VGAM269 host target gene. FAM8A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FAM8A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FAM8A1 BINDING SITE, designated SEQ ID:18380, to the nucleotide sequence of VGAM269 RNA, herein designated VGAM RNA, also designated SEQ

ID:2980.

[15489] A function of VGAM269 is therefore inhibition of Family with Sequence Similarity 8, Member A1 (FAM8A1, Accession NM_016255). Accordingly, utilities of VGAM269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAM8A1. IMP-2 (Accession NM_006548) is another VGAM269 host target gene. IMP-2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IMP-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMP-2 BINDING SITE, designated SEQ ID:13305, to the nucleotide sequence of VGAM269 RNA, herein designated VGAM RNA, also designated SEQ ID:2980.

[15490] Another function of VGAM269 is therefore inhibition of IMP-2 (Accession NM_006548). Accordingly, utilities of VGAM269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMP-2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger

270 (VGAM270) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15491] VGAM270 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM270 was detected is described hereinabove with reference to Figs. 1–8.

[15492] VGAM270 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM270 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15493] VGAM270 gene encodes a VGAM270 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM270 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM270 precursor RNA is designated SEQ ID:256, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:256 is located at position 21071 relative to the genome of Epiphyas Postvittana Nucleopolyhedrovirus.

[15494] VGAM270 precursor RNA folds onto itself, forming

VGAM270 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15495] An enzyme complex designated DICER COMPLEX, `dices` the VGAM270 folded precursor RNA into VGAM270 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM270 RNA is designated SEQ ID:2981, and is provided hereinbelow with reference to the sequence listing part.

[15496] VGAM270 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM270 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM270 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15497] VGAM270 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM270 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM270 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM270 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM270 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15498] The complementary binding of VGAM270 RNA, herein designated VGAM RNA, to host target binding sites on VGAM270 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM270 host target RNA into VGAM270 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15499] It is appreciated that VGAM270 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM270 host target genes. The mRNA of each one of this plurality of VGAM270 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM270 RNA, herein designated VGAM RNA, and which when bound by VGAM270 RNA causes inhibition of translation of respective one or more VGAM270 host target proteins.

[15500] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM270 gene, herein designated VGAM GENE, on one or more VGAM270 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15501] It is yet further appreciated that a function of VGAM270 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM270 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM270 correlate with, and may be deduced from, the identity of the host target genes which

VGAM270 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15502] Nucleotide sequences of the VGAM270 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM270 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM270 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM270 are further described hereinbelow with reference to Table 1.

[15503] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM270 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM270 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15504] As mentioned hereinabove with reference to Fig. 1, a function of VGAM270 gene, herein designated VGAM is inhibition of expression of VGAM270 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM270 correlate with, and may be deduced from, the identity of the target genes which VGAM270 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[15505] FREB (Accession NM_032738) is a VGAM270 host target gene. FREB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FREB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FREB BINDING SITE, designated SEQ ID:26467, to the nucleotide sequence of VGAM270 RNA, herein designated VGAM RNA, also designated SEQ ID:2981.

[15506] A function of VGAM270 is therefore inhibition of FREB (Accession NM_032738). Accordingly, utilities of VGAM270 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FREB. FLJ12610 (Accession NM_024782) is another VGAM270 host target gene. FLJ12610 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12610, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12610 BINDING SITE, designated SEQ ID:24151, to the nucleotide sequence of VGAM270 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:2981.

[15507] Another function of VGAM270 is therefore inhibition of FLJ12610 (Accession NM_024782). Accordingly, utilities of VGAM270 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12610. RAB40A, Member RAS Oncogene Family (RAB40A, Accession XM_088733) is another VGAM270 host target gene. RAB40A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RAB40A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB40A BINDING SITE, designated SEQ ID:39932, to the nucleotide sequence of VGAM270 RNA, herein designated VGAM RNA, also designated SEQ ID:2981.

[15508] Another function of VGAM270 is therefore inhibition of RAB40A, Member RAS Oncogene Family (RAB40A, Accession XM_088733). Accordingly, utilities of VGAM270 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB40A. LOC131870 (Accession XM_059544) is another VGAM270 host target gene. LOC131870 BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by LOC131870, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131870 BINDING SITE, designated SEQ ID:37018, to the nucleotide sequence of VGAM270 RNA, herein designated VGAM RNA, also designated SEQ ID:2981.

[15509] Another function of VGAM270 is therefore inhibition of LOC131870 (Accession XM_059544). Accordingly, utilities of VGAM270 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131870. LOC154222 (Accession XM_098497) is another VGAM270 host target gene. LOC154222 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154222 BINDING SITE, designated SEQ ID:41693, to the nucleotide sequence of VGAM270 RNA, herein designated VGAM RNA, also designated SEQ ID:2981.

[15510] Another function of VGAM270 is therefore inhibition of

LOC154222 (Accession XM_098497). Accordingly, utilities of VGAM270 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154222. LOC155064 (Accession XM_088128) is another VGAM270 host target gene. LOC155064 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155064, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155064 BINDING SITE, designated SEQ ID:39529, to the nucleotide sequence of VGAM270 RNA, herein designated VGAM RNA, also designated SEQ ID:2981.

[15511] Another function of VGAM270 is therefore inhibition of LOC155064 (Accession XM_088128). Accordingly, utilities of VGAM270 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155064. LOC201194 (Accession XM_117061) is another VGAM270 host target gene. LOC201194 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201194, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC201194 BINDING SITE, designated SEQ ID:43218, to the nucleotide sequence of VGAM270 RNA, herein designated VGAM RNA, also designated SEQ ID:2981.

[15512] Another function of VGAM270 is therefore inhibition of LOC201194 (Accession XM_117061). Accordingly, utilities of VGAM270 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201194. LOC91351 (Accession XM_037817) is another VGAM270 host target gene. LOC91351 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91351, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91351 BINDING SITE, designated SEQ ID:32700, to the nucleotide sequence of VGAM270 RNA, herein designated VGAM RNA, also designated SEQ ID:2981.

[15513] Another function of VGAM270 is therefore inhibition of LOC91351 (Accession XM_037817). Accordingly, utilities of VGAM270 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91351. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 271 (VGAM271) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15514] VGAM271 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM271 was detected is described hereinabove with reference to Figs. 1–8.

[15515] VGAM271 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM271 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15516] VGAM271 gene encodes a VGAM271 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM271 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM271 precursor RNA is designated SEQ ID:257, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:257 is

located at position 113843 relative to the genome of Epi-
phyas Postvittana Nucleopolyhedrovirus.

[15517] VGAM271 precursor RNA folds onto itself, forming VGAM271 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15518] An enzyme complex designated DICER COMPLEX, `dices` the VGAM271 folded precursor RNA into VGAM271 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM271 RNA is designated SEQ ID:2982, and is provided hereinbelow with reference to the sequence listing part.

[15519] VGAM271 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM271 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM271 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[15520] VGAM271 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM271 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM271 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM271 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM271 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15521] The complementary binding of VGAM271 RNA, herein designated VGAM RNA, to host target binding sites on VGAM271 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM271 host target RNA into VGAM271 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15522] It is appreciated that VGAM271 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM271 host target genes. The mRNA of each one of this plurality of VGAM271 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM271 RNA, herein designated VGAM RNA, and which when bound by VGAM271 RNA causes inhibition of translation of respective one or more VGAM271

host target proteins.

[15523] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM271 gene, herein designated VGAM GENE, on one or more VGAM271 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15524] It is yet further appreciated that a function of VGAM271 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM271 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucle-

opolyhedrovirus. Specific functions, and accordingly utilities, of VGAM271 correlate with, and may be deduced from, the identity of the host target genes which VGAM271 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15525] Nucleotide sequences of the VGAM271 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM271 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM271 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM271 are further described hereinbelow with reference to Table 1.

[15526] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM271 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM271 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15527] As mentioned hereinabove with reference to Fig. 1, a function of VGAM271 gene, herein designated VGAM is inhibition of expression of VGAM271 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM271 correlate with, and may be deduced from, the identity of the target genes which VGAM271 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15528] Solute Carrier Family 25 (mitochondrial carrier, Aralar), Member 12 (SLC25A12, Accession NM_003705) is a VGAM271 host target gene. SLC25A12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC25A12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC25A12 BINDING SITE, designated SEQ ID:9805, to the nucleotide sequence of VGAM271 RNA, herein designated VGAM RNA, also designated SEQ ID:2982.

[15529] A function of VGAM271 is therefore inhibition of Solute Carrier Family 25 (mitochondrial carrier, Aralar), Member 12 (SLC25A12, Accession NM_003705), a gene which is a calcium -dependent mitochondrial solute carrier. may have a function in the urea cycle (by similarity). Accordingly, utilities of VGAM271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC25A12. The function of SLC25A12 has been es-

established by previous studies. The mitochondrial inner membrane harbors a set of carrier proteins for metabolite transport that constitute a superfamily of related proteins. The yeast open reading frame YNL083W encodes a predicted protein with characteristics of both mitochondrial carrier and calcium-binding proteins. By searching EST databases for proteins with similar features, del Arco and Satrustegui (1998) identified several *C. elegans* cDNAs encoding putative calcium-dependent mitochondrial carrier proteins. Using the sequence of one of the *C. elegans* cDNAs, the authors searched human EST databases and found cDNAs encoding a related human protein that they designated 'Aralar' (formed by combining the given name of the first author, 'Araceli,' with a Spanish word meaning 'very long,' 'hiperlarga'). The N-terminal portion of the predicted 678-amino acid Aralar protein contains 3 canonical EF-hand calcium-binding domains and 2 imperfect EF-hand domains. The authors demonstrated that this half of the protein bound calcium in vitro. The C-terminal half of Aralar shares 28 to 29% identity with proteins of the mitochondrial solute carrier family, including oxoglutarate/malate carrier (OMIM Ref. No. 604165), ADP/ATP translocase-2 (OMIM Ref. No. 300150), UCP1

(OMIM Ref. No. 113730), and tricarboxylate carrier (OMIM Ref. No. 190315). Like the other mitochondrial carrier proteins, the C-terminal region of Aralar contains 6 potential transmembrane domains. Immunocytochemistry and cell fractionation studies showed that both exogenously expressed and endogenous Aralar protein are localized within the mitochondria. Northern blot analysis revealed that Aralar is expressed as 2.9- and 3.2-kb mRNAs predominantly in heart and skeletal muscle, with weaker expression in brain and kidney. Del Arco and Satrustegui (1998) concluded that the domain structure, mitochondrial localization, and expression in excitable tissues of Aralar suggest a possible function for this protein as a calcium-dependent mitochondrial solute carrier. Crackower et al. (1999) mapped the SLC25A12 gene to chromosome 2q24 by FISH, somatic cell and radiation hybrid mapping, and YAC clone analyses. Sanz et al. (2000) localized the SLC25A12 gene to 2q31 by FISH.

[15530] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15531] del Arco, A.; Satrustegui, J. : Molecular cloning of aralar, a new member of the mitochondrial carrier superfamily that

binds calcium and is present in human muscle and brain.

J. Biol. Chem. 273: 23327–23334, 1998. ; and

[15532] Crackower, M. A.; Sinasac, D. S.; Lee, J. R.; Herbrick, J.–A.; Tsui, L.–C.; Scherer, S. W. : Assignment of the SLC25A12 gene coding for the human calcium–binding mitochondrial solute carrier.

[15533] Further studies establishing the function and utilities of SLC25A12 are found in John Hopkins OMIM database record ID 603667, and in cited publications numbered 989–991 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ATPase, Class II, Type 9A (ATP9A, Accession XM_030577) is another VGAM271 host target gene. ATP9A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP9A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP9A BINDING SITE, designated SEQ ID:31078, to the nucleotide sequence of VGAM271 RNA, herein designated VGAM RNA, also designated SEQ ID:2982.

[15534] Another function of VGAM271 is therefore inhibition of ATPase, Class II, Type 9A (ATP9A, Accession XM_030577).

Accordingly, utilities of VGAM271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP9A. F-box Only Protein 21 (FBXO21, Accession NM_033624) is another VGAM271 host target gene. FBXO21 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXO21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO21 BINDING SITE, designated SEQ ID:27321, to the nucleotide sequence of VGAM271 RNA, herein designated VGAM RNA, also designated SEQ ID:2982.

[15535] Another function of VGAM271 is therefore inhibition of F-box Only Protein 21 (FBXO21, Accession NM_033624). Accordingly, utilities of VGAM271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO21. FLJ22601 (Accession NM_024822) is another VGAM271 host target gene. FLJ22601 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22601, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of FLJ22601 BINDING SITE, designated SEQ ID:24211, to the nucleotide sequence of VGAM271 RNA, herein designated VGAM RNA, also designated SEQ ID:2982.

[15536] Another function of VGAM271 is therefore inhibition of FLJ22601 (Accession NM_024822). Accordingly, utilities of VGAM271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22601. Interleukin 10 Receptor, Beta (IL10RB, Accession NM_000628) is another VGAM271 host target gene. IL10RB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL10RB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL10RB BINDING SITE, designated SEQ ID:6244, to the nucleotide sequence of VGAM271 RNA, herein designated VGAM RNA, also designated SEQ ID:2982.

[15537] Another function of VGAM271 is therefore inhibition of Interleukin 10 Receptor, Beta (IL10RB, Accession NM_000628). Accordingly, utilities of VGAM271 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with IL10RB. MGC13102 (Accession NM_032323) is another VGAM271 host target gene. MGC13102 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC13102, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13102 BINDING SITE, designated SEQ ID:26134, to the nucleotide sequence of VGAM271 RNA, herein designated VGAM RNA, also designated SEQ ID:2982.

[15538] Another function of VGAM271 is therefore inhibition of MGC13102 (Accession NM_032323). Accordingly, utilities of VGAM271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13102. SPEC1 (Accession NM_020239) is another VGAM271 host target gene. SPEC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SPEC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPEC1 BINDING SITE, designated SEQ ID:21509, to the nucleotide sequence of

VGAM271 RNA, herein designated VGAM RNA, also designated SEQ ID:2982.

[15539] Another function of VGAM271 is therefore inhibition of SPEC1 (Accession NM_020239). Accordingly, utilities of VGAM271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPEC1. LOC147645 (Accession XM_085831) is another VGAM271 host target gene. LOC147645 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147645, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147645 BINDING SITE, designated SEQ ID:38357, to the nucleotide sequence of VGAM271 RNA, herein designated VGAM RNA, also designated SEQ ID:2982.

[15540] Another function of VGAM271 is therefore inhibition of LOC147645 (Accession XM_085831). Accordingly, utilities of VGAM271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147645. LOC150378 (Accession XM_086857) is another VGAM271 host target gene. LOC150378 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC150378, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150378 BINDING SITE, designated SEQ ID:38921, to the nucleotide sequence of VGAM271 RNA, herein designated VGAM RNA, also designated SEQ ID:2982.

[15541] Another function of VGAM271 is therefore inhibition of LOC150378 (Accession XM_086857). Accordingly, utilities of VGAM271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150378. LOC152313 (Accession XM_098190) is another VGAM271 host target gene. LOC152313 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152313 BINDING SITE, designated SEQ ID:41474, to the nucleotide sequence of VGAM271 RNA, herein designated VGAM RNA, also designated SEQ ID:2982.

[15542] Another function of VGAM271 is therefore inhibition of LOC152313 (Accession XM_098190). Accordingly, utilities

of VGAM271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152313. LOC164397 (Accession XM_092780) is another VGAM271 host target gene. LOC164397 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC164397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164397 BINDING SITE, designated SEQ ID:40150, to the nucleotide sequence of VGAM271 RNA, herein designated VGAM RNA, also designated SEQ ID:2982.

[15543] Another function of VGAM271 is therefore inhibition of LOC164397 (Accession XM_092780). Accordingly, utilities of VGAM271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164397. LOC220763 (Accession XM_055551) is another VGAM271 host target gene. LOC220763 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC220763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC220763 BINDING SITE, designated SEQ ID:36301, to the nucleotide sequence of VGAM271 RNA, herein designated VGAM RNA, also designated SEQ ID:2982.

[15544] Another function of VGAM271 is therefore inhibition of LOC220763 (Accession XM_055551). Accordingly, utilities of VGAM271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220763. LOC90317 (Accession XM_030892) is another VGAM271 host target gene. LOC90317 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90317 BINDING SITE, designated SEQ ID:31206, to the nucleotide sequence of VGAM271 RNA, herein designated VGAM RNA, also designated SEQ ID:2982.

[15545] Another function of VGAM271 is therefore inhibition of LOC90317 (Accession XM_030892). Accordingly, utilities of VGAM271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90317. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 272 (VGAM272) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15546] VGAM272 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM272 was detected is described hereinabove with reference to Figs. 1–8.

[15547] VGAM272 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM272 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15548] VGAM272 gene encodes a VGAM272 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM272 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM272 precursor RNA is designated SEQ ID:258, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:258 is located at position 105105 relative to the genome of Epi-

phyas Postvittana Nucleopolyhedrovirus.

[15549] VGAM272 precursor RNA folds onto itself, forming VGAM272 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15550] An enzyme complex designated DICER COMPLEX, `dices` the VGAM272 folded precursor RNA into VGAM272 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM272 RNA is designated SEQ ID:2983, and is provided hereinbelow with reference to the sequence listing part.

[15551] VGAM272 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM272 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM272 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15552] VGAM272 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM272 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM272 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM272 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM272 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15553] The complementary binding of VGAM272 RNA, herein designated VGAM RNA, to host target binding sites on VGAM272 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM272 host target RNA into VGAM272 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15554] It is appreciated that VGAM272 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM272 host target genes. The mRNA of each one of this plurality of VGAM272 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM272 RNA, herein designated VGAM RNA, and which when bound by VGAM272 RNA causes inhibition of translation of respective one or more VGAM272 host target proteins.

[15555] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM272 gene, herein designated VGAM GENE, on one or more VGAM272 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15556] It is yet further appreciated that a function of VGAM272 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM272 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utili-

ties, of VGAM272 correlate with, and may be deduced from, the identity of the host target genes which VGAM272 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15557] Nucleotide sequences of the VGAM272 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM272 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM272 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM272 are further described hereinbelow with reference to Table 1.

[15558] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM272 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM272 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15559] As mentioned hereinabove with reference to Fig. 1, a function of VGAM272 gene, herein designated VGAM is inhibition of expression of VGAM272 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM272 correlate with, and may be deduced

from, the identity of the target genes which VGAM272 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15560] Kelch-like 3 (Drosophila) (KLHL3, Accession XM_113450) is a VGAM272 host target gene. KLHL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL3 BINDING SITE, designated SEQ ID:42270, to the nucleotide sequence of VGAM272 RNA, herein designated VGAM RNA, also designated SEQ ID:2983.

[15561] A function of VGAM272 is therefore inhibition of Kelch-like 3 (Drosophila) (KLHL3, Accession XM_113450). Accordingly, utilities of VGAM272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL3. Solute Carrier Family 24 (sodium/potassium/calcium exchanger), Member 1 (SLC24A1, Accession NM_004727) is another VGAM272 host target gene. SLC24A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC24A1, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC24A1 BINDING SITE, designated SEQ ID:11100, to the nucleotide sequence of VGAM272 RNA, herein designated VGAM RNA, also designated SEQ ID:2983.

[15562] Another function of VGAM272 is therefore inhibition of Solute Carrier Family 24 (sodium/potassium/calcium exchanger), Member 1 (SLC24A1, Accession NM_004727), a gene which is a critical component of the visual transduction cascade, controlling the calcium concentration of outer segments during light and darkness. Accordingly, utilities of VGAM272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC24A1. The function of SLC24A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM142. Suppressor of Fused Homolog (Drosophila) (SUFU, Accession NM_016169) is another VGAM272 host target gene. SUFU BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SUFU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUFU BINDING SITE, designated SEQ ID:18255, to the nucleotide sequence of VGAM272 RNA, herein designated VGAM RNA, also designated SEQ ID:2983.

[15563] Another function of VGAM272 is therefore inhibition of Suppressor of Fused Homolog (Drosophila) (SUFU, Accession NM_016169). Accordingly, utilities of VGAM272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUFU. ADP-ribosylation Factor GTPase Activating Protein 1 (ARFGAP1, Accession NM_018209) is another VGAM272 host target gene. ARFGAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARFGAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARFGAP1 BINDING SITE, designated SEQ ID:20110, to the nucleotide sequence of VGAM272 RNA, herein designated VGAM RNA, also designated SEQ ID:2983.

[15564] Another function of VGAM272 is therefore inhibition of ADP-ribosylation Factor GTPase Activating Protein 1

(ARFGAP1, Accession NM_018209). Accordingly, utilities of VGAM272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARFGAP1. Cyclin E2 (CCNE2, Accession NM_057749) is another VGAM272 host target gene. CCNE2 BINDING SITE1 and CCNE2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CCNE2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCNE2 BINDING SITE1 and CCNE2 BINDING SITE2, designated SEQ ID:27711 and SEQ ID:11050 respectively, to the nucleotide sequence of VGAM272 RNA, herein designated VGAM RNA, also designated SEQ ID:2983.

[15565] Another function of VGAM272 is therefore inhibition of Cyclin E2 (CCNE2, Accession NM_057749). Accordingly, utilities of VGAM272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNE2. KIAA0553 (Accession XM_045981) is another VGAM272 host target gene. KIAA0553 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0553, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0553 BINDING SITE, designated SEQ ID:34638, to the nucleotide sequence of VGAM272 RNA, herein designated VGAM RNA, also designated SEQ ID:2983.

[15566] Another function of VGAM272 is therefore inhibition of KIAA0553 (Accession XM_045981). Accordingly, utilities of VGAM272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0553. KIAA1200 (Accession XM_031054) is another VGAM272 host target gene. KIAA1200 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1200, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1200 BINDING SITE, designated SEQ ID:31264, to the nucleotide sequence of VGAM272 RNA, herein designated VGAM RNA, also designated SEQ ID:2983.

[15567] Another function of VGAM272 is therefore inhibition of KIAA1200 (Accession XM_031054). Accordingly, utilities of VGAM272 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1200. MGC12760 (Accession NM_032723) is another VGAM272 host target gene. MGC12760 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC12760, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12760 BINDING SITE, designated SEQ ID:26450, to the nucleotide sequence of VGAM272 RNA, herein designated VGAM RNA, also designated SEQ ID:2983.

[15568] Another function of VGAM272 is therefore inhibition of MGC12760 (Accession NM_032723). Accordingly, utilities of VGAM272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12760. LOC153505 (Accession XM_087693) is another VGAM272 host target gene. LOC153505 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153505, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153505 BINDING SITE, designated SEQ ID:39383, to

the nucleotide sequence of VGAM272 RNA, herein designated VGAM RNA, also designated SEQ ID:2983.

[15569] Another function of VGAM272 is therefore inhibition of LOC153505 (Accession XM_087693). Accordingly, utilities of VGAM272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153505. LOC157503 (Accession XM_098767) is another VGAM272 host target gene. LOC157503 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157503, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157503 BINDING SITE, designated SEQ ID:41812, to the nucleotide sequence of VGAM272 RNA, herein designated VGAM RNA, also designated SEQ ID:2983.

[15570] Another function of VGAM272 is therefore inhibition of LOC157503 (Accession XM_098767). Accordingly, utilities of VGAM272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157503. LOC162333 (Accession XM_102591) is another VGAM272 host target gene. LOC162333 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC162333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:42128, to the nucleotide sequence of VGAM272 RNA, herein designated VGAM RNA, also designated SEQ ID:2983.

[15571] Another function of VGAM272 is therefore inhibition of LOC162333 (Accession XM_102591). Accordingly, utilities of VGAM272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162333. LOC253782 (Accession XM_171023) is another VGAM272 host target gene. LOC253782 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253782, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253782 BINDING SITE, designated SEQ ID:45797, to the nucleotide sequence of VGAM272 RNA, herein designated VGAM RNA, also designated SEQ ID:2983.

[15572] Another function of VGAM272 is therefore inhibition of LOC253782 (Accession XM_171023). Accordingly, utilities

of VGAM272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253782. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 273 (VGAM273) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15573] VGAM273 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM273 was detected is described hereinabove with reference to Figs. 1–8.

[15574] VGAM273 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM273 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15575] VGAM273 gene encodes a VGAM273 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM273 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM273 precursor RNA is designated SEQ ID:259, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:259 is located at position 90664 relative to the genome of Epi-phyas Postvittana Nucleopolyhedrovirus.

[15576] VGAM273 precursor RNA folds onto itself, forming VGAM273 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15577] An enzyme complex designated DICER COMPLEX, `dices` the VGAM273 folded precursor RNA into VGAM273 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM273 RNA is designated SEQ ID:2984, and

is provided hereinbelow with reference to the sequence listing part.

[15578] VGAM273 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM273 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM273 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15579] VGAM273 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM273 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM273 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM273 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM273 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15580] The complementary binding of VGAM273 RNA, herein designated VGAM RNA, to host target binding sites on VGAM273 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM273 host target RNA into VGAM273 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15581] It is appreciated that VGAM273 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM273 host target genes. The mRNA of each one of this plurality of VGAM273 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM273 RNA, herein designated VGAM RNA, and which when bound by VGAM273 RNA causes inhibition of translation of respective one or more VGAM273 host target proteins.

[15582] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM273 gene, herein designated VGAM GENE, on one or more VGAM273 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15583] It is yet further appreciated that a function of VGAM273 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM273 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM273 correlate with, and may be deduced from, the identity of the host target genes which VGAM273 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15584] Nucleotide sequences of the VGAM273 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM273 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM273 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM273 are further described hereinbelow with reference to Table 1.

[15585] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM273 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM273 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15586] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM273 gene, herein designated VGAM is inhibition of expression of VGAM273 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM273 correlate with, and may be deduced from, the identity of the target genes which VGAM273 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15587] Fibroblast Growth Factor 23 (FGF23, Accession NM_020638) is a VGAM273 host target gene. FGF23 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGF23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF23 BINDING SITE, designated SEQ ID:21794, to the nucleotide sequence of VGAM273 RNA, herein designated VGAM RNA, also designated SEQ ID:2984.

[15588] A function of VGAM273 is therefore inhibition of Fibroblast Growth Factor 23 (FGF23, Accession NM_020638), a gene which is a member of the fibroblast growth factor family. Accordingly, utilities of VGAM273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF23. The function of FGF23 and

its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM24. Potassium Inwardly-rectifying Channel, Subfamily J, Member 16 (KCNJ16, Accession NM_018658) is another VGAM273 host target gene. KCNJ16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNJ16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ16 BINDING SITE, designated SEQ ID:20729, to the nucleotide sequence of VGAM273 RNA, herein designated VGAM RNA, also designated SEQ ID:2984.

[15589] Another function of VGAM273 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 16 (KCNJ16, Accession NM_018658). Accordingly, utilities of VGAM273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ16. Lactate Dehydrogenase B (LDHB, Accession NM_002300) is another VGAM273 host target gene. LDHB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LDHB, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LDHB BINDING SITE, designated SEQ ID:8087, to the nucleotide sequence of VGAM273 RNA, herein designated VGAM RNA, also designated SEQ ID:2984.

[15590] Another function of VGAM273 is therefore inhibition of Lactate Dehydrogenase B (LDHB, Accession NM_002300), a gene which causes dehydrogenation of lactate. Accordingly, utilities of VGAM273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LDHB. The function of LDHB has been established by previous studies. LDHB and peptidase B (OMIM Ref. No. 169900) are linked (Santachiara et al., 1970) and both loci are on chromosome 12 (Chen et al., 1973). Kitamura et al. (1971) reported the first case of a complete deficiency of lactate dehydrogenase subunit H(B) in serum, saliva and erythrocytes of a 64-year-old male with mild diabetes. Study made on family members revealed low LDH activity in their serum also linked with decreased relative activity of the H4(B4) fraction. Based on the comparison of the calculated ratio of H to M subunits in normal and affected family members, it was hypothesized

that the proband is homozygous while the abnormal family members are heterozygous, assuming a single gene is involved. Red cell metabolism in the proband was studied by Miwa et al. (1971); neither reticulocytosis nor hemolytic anemia was present. Thus, although LDHA deficiency leads to myoglobinuria and risk of renal failure after strenuous exercise, LDHB deficiency probably has no clear symptomatic consequences. As pointed out by Sudo (1993), LDH deficiency is of interest to laboratory medicine mainly because it can cause misdiagnosis in those disorders in which elevation of serum LDH is expected. LDH deficiency can probably be considered a 'nondisease.' In a screening of 2,880 blood samples from healthy persons in the Fukuoka Prefecture in Japan, Maekawa et al. (1994) found that the frequency of heterozygotes for either LDHA or LDHB deficiency was 0.104% at each locus. These estimated frequencies were slightly lower than, but not significantly different from, those found previously in the Shizuoka Prefecture. In a case of deletion of the short arm of chromosome 12, Weiss et al. (1973) found evidence that LDHB is located there. From study of somatic cell hybrids Hamerton et al. (1975) concluded that LDHB is in the 12q21-pter region.

Rethore et al. (1975) found augmentation of LDHB activity in a boy trisomic for the short arm of chromosome 12. From study of 3 patients with different deletions of chromosome 12, Rethore et al. (1976) concluded that the G3PD locus is on the distal part of 12p, between p12.2 and 12pter, and that the LDHB locus is on the middle third between 12p12.1 and 12p12.2. The results for TPI were similar to those for G3PD, suggesting the same distal localization. Mohrenweiser and Neel (1981) identified thermolabile variants of lactate dehydrogenase B, glucosephosphate isomerase, and glucose-6-phosphate dehydrogenase. None was detectable as a variant by standard electrophoretic techniques. All were inherited. Steinbach and Rehder (1987) demonstrated dosage effect with LDHB in a case of tetrasomy of 12p. Sakai et al. (1987) isolated and sequenced LDHB cDNA. Nucleotide and amino acid sequences showed 68% and 75% identity, respectively, with those of LDHA. Sudo et al. (1990) demonstrated 93% homology between an LDHB processed pseudogene and the functional gene. The pseudogene was mapped to the X chromosome by dot blot analysis.

[15591] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [15592] Kitamura, M.; Iijima, N.; Hashimoto, F.; Hiratsuka, A. : Hereditary deficiency of subunit H of lactate dehydrogenase. Clin. Chim. Acta 34: 419–423, 1971. ; and
- [15593] Sudo, K.; Maekawa, M.; Luedemann, M. M.; Deaven, L. L.; Li, S. S.–L. : Human lactate dehydrogenase–B processed pseudogene: nucleotide sequence analysis and assignment to the X–chromosom.
- [15594] Further studies establishing the function and utilities of LDHB are found in John Hopkins OMIM database record ID 150100, and in cited publications numbered 5076, 11205–11214, 1127 and 11290–11301 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Opioid Binding Protein/cell Adhesion Molecule–like (OPCML, Accession NM_002545) is another VGAM273 host target gene. OPCML BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OPCML, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPCML BINDING SITE, designated SEQ ID:8396, to the nucleotide sequence of VGAM273 RNA, herein designated VGAM RNA, also desig–

nated SEQ ID:2984.

[15595] Another function of VGAM273 is therefore inhibition of Opioid Binding Protein/cell Adhesion Molecule-like (OPCML, Accession NM_002545), a gene which may function as a GPI-anchored neural cell adhesion molecule. Accordingly, utilities of VGAM273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPCML. The function of OPCML and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM71. Protein Kinase, CAMP-dependent, Catalytic, Alpha (PRKACA, Accession NM_002730) is another VGAM273 host target gene. PRKACA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKACA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKACA BINDING SITE, designated SEQ ID:8597, to the nucleotide sequence of VGAM273 RNA, herein designated VGAM RNA, also designated SEQ ID:2984.

[15596] Another function of VGAM273 is therefore inhibition of

Protein Kinase, CAMP-dependent, Catalytic, Alpha (PRKACA, Accession NM_002730), a gene which phosphorylates target proteins on serine or threonine residues. Accordingly, utilities of VGAM273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKACA. The function of PRKACA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM175. Rho-associated, Coiled-coil Containing Protein Kinase 2 (ROCK2, Accession XM_038377) is another VGAM273 host target gene. ROCK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ROCK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROCK2 BINDING SITE, designated SEQ ID:32835, to the nucleotide sequence of VGAM273 RNA, herein designated VGAM RNA, also designated SEQ ID:2984.

[15597] Another function of VGAM273 is therefore inhibition of Rho-associated, Coiled-coil Containing Protein Kinase 2 (ROCK2, Accession XM_038377), a gene which regulates

cytokinesis, smooth muscle contraction, the formation of actin stress fibers and focal adhesions. Accordingly, utilities of VGAM273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROCK2. The function of ROCK2 has been established by previous studies. ROCK2 is a serine/threonine kinase that regulates cytokinesis, smooth muscle contraction, the formation of actin stress fibers and focal adhesions, and the activation of the c-fos (OMIM Ref. No. 164810) serum response element. ROCK2, which is an isozyme of ROCK1 (OMIM Ref. No. 601702), is a target for the small GTPase Rho (e.g., 165390). Nakamura et al. (2001) studied the role of Rho in the migration of corneal epithelial cells in rabbit. They detected both ROCK1 (OMIM Ref. No. 601702) and ROCK2 in the corneal epithelium at protein and mRNA levels. They found that exoenzyme C3, a Rho inhibitor, inhibits corneal epithelial migration in a dose-dependent manner and prevents the stimulatory effect of the Rho activator lysophosphatidic acid (LPA). Both cytochalasin B, an inhibitor of actin filament assembly, and ML7, an inhibitor of myosin light chain kinase, also prevent LPA stimulation of epithelial migration. The authors suggested that Rho mediates corneal epithelial migration

in response to external stimuli by regulating the organization of the actin cytoskeleton. Rao et al. (2001) investigated the role of Rho kinase in the modulation of aqueous humor outflow facility. The treatment of human trabecular meshwork and canal of Schlemm cells with a Rho kinase-specific inhibitor led to significant but reversible changes in cell shape and decreased actin stress fibers, focal adhesions, and protein phosphotyrosine staining. Based on the Rho kinase inhibitor-induced changes in myosin light chain phosphorylation and actomyosin organization, the authors suggested that cellular relaxation and loss of cell-substratum adhesions in the human trabecular meshwork and canal of Schlemm cells could result in either increased paracellular fluid flow across the canal of Schlemm or altered flow pathway through the juxtacanalicular tissue, thereby lowering resistance to outflow. They suggested Rho kinase as a potential target for the development of drugs to modulate intraocular pressure in glaucoma patients.

[15598] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15599] Nakamura, M.; Nagano, T.; Chikama, T.; Nishida, T. : Role

of the small GTP-binding protein Rho in epithelial cell migration in the rabbit cornea. Invest. Ophthalm. Vis. Sci. 42: 941-947, 2001. ; and

[15600] Rao, P. V.; Deng, P.-F.; Kumar, J.; Epstein, D. L. : Modulation of aqueous humor outflow facility by the Rho kinase-specific inhibitor Y-27632. Invest. Ophthalm. Vis. Sci. 42: 1029-1037.

[15601] Further studies establishing the function and utilities of ROCK2 are found in John Hopkins OMIM database record ID 604002, and in cited publications numbered 9440, 10912-1091 and 7392 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cysteine and Tyrosine-rich 1 (CYR1, Accession NM_052954) is another VGAM273 host target gene. CYR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYR1 BINDING SITE, designated SEQ ID:27514, to the nucleotide sequence of VGAM273 RNA, herein designated VGAM RNA, also designated SEQ ID:2984.

[15602] Another function of VGAM273 is therefore inhibition of Cysteine and Tyrosine-rich 1 (CYR1, Accession NM_052954). Accordingly, utilities of VGAM273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYR1. KIAA1036 (Accession NM_014909) is another VGAM273 host target gene. KIAA1036 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1036 BINDING SITE, designated SEQ ID:17126, to the nucleotide sequence of VGAM273 RNA, herein designated VGAM RNA, also designated SEQ ID:2984.

[15603] Another function of VGAM273 is therefore inhibition of KIAA1036 (Accession NM_014909). Accordingly, utilities of VGAM273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1036. SBBI31 (Accession NM_014035) is another VGAM273 host target gene. SBBI31 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SBBI31, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SBBI31 BINDING SITE, designated SEQ ID:15266, to the nucleotide sequence of VGAM273 RNA, herein designated VGAM RNA, also designated SEQ ID:2984.

[15604] Another function of VGAM273 is therefore inhibition of SBBI31 (Accession NM_014035). Accordingly, utilities of VGAM273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SBBI31. LOC124842 (Accession XM_064333) is another VGAM273 host target gene. LOC124842 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC124842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124842 BINDING SITE, designated SEQ ID:37261, to the nucleotide sequence of VGAM273 RNA, herein designated VGAM RNA, also designated SEQ ID:2984.

[15605] Another function of VGAM273 is therefore inhibition of LOC124842 (Accession XM_064333). Accordingly, utilities of VGAM273 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC124842. LOC138399 (Accession XM_059971) is another VGAM273 host target gene. LOC138399 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC138399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138399 BINDING SITE, designated SEQ ID:37131, to the nucleotide sequence of VGAM273 RNA, herein designated VGAM RNA, also designated SEQ ID:2984.

[15606] Another function of VGAM273 is therefore inhibition of LOC138399 (Accession XM_059971). Accordingly, utilities of VGAM273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138399. LOC221814 (Accession XM_168226) is another VGAM273 host target gene. LOC221814 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221814, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221814 BINDING SITE, designated SEQ ID:45090, to

the nucleotide sequence of VGAM273 RNA, herein designated VGAM RNA, also designated SEQ ID:2984.

[15607] Another function of VGAM273 is therefore inhibition of LOC221814 (Accession XM_168226). Accordingly, utilities of VGAM273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221814. LOC90317 (Accession XM_030892) is another VGAM273 host target gene. LOC90317 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90317 BINDING SITE, designated SEQ ID:31207, to the nucleotide sequence of VGAM273 RNA, herein designated VGAM RNA, also designated SEQ ID:2984.

[15608] Another function of VGAM273 is therefore inhibition of LOC90317 (Accession XM_030892). Accordingly, utilities of VGAM273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90317. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 274 (VGAM274) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15609] VGAM274 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM274 was detected is described hereinabove with reference to Figs. 1–8.

[15610] VGAM274 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM274 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15611] VGAM274 gene encodes a VGAM274 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM274 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM274 precursor RNA is designated SEQ ID:260, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:260 is located at position 80659 relative to the genome of Epiphyas Postvittana Nucleopolyhedrovirus.

[15612] VGAM274 precursor RNA folds onto itself, forming VGAM274 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15613] An enzyme complex designated DICER COMPLEX, `dices` the VGAM274 folded precursor RNA into VGAM274 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM274 RNA is designated SEQ ID:2985, and is provided hereinbelow with reference to the sequence listing part.

[15614] VGAM274 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM274 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM274 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15615] VGAM274 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM274 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM274 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM274 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM274 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15616] The complementary binding of VGAM274 RNA, herein designated VGAM RNA, to host target binding sites on VGAM274 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM274 host target RNA into VGAM274 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15617] It is appreciated that VGAM274 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM274 host target genes. The mRNA of each one of this plurality of VGAM274 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM274 RNA, herein designated VGAM RNA, and which when bound by VGAM274 RNA causes inhibition of translation of respective one or more VGAM274 host target proteins.

[15618] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM274 gene, herein designated VGAM GENE, on one or more VGAM274 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15619] It is yet further appreciated that a function of VGAM274 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM274 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM274 correlate with, and may be deduced

from, the identity of the host target genes which VGAM274 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15620] Nucleotide sequences of the VGAM274 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM274 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM274 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM274 are further described hereinbelow with reference to Table 1.

[15621] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM274 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM274 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15622] As mentioned hereinabove with reference to Fig. 1, a function of VGAM274 gene, herein designated VGAM is inhibition of expression of VGAM274 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM274 correlate with, and may be deduced from, the identity of the target genes which VGAM274

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15623] SRB7 Suppressor of RNA Polymerase B Homolog (yeast) (SURB7, Accession NM_004264) is a VGAM274 host target gene. SURB7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SURB7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SURB7 BINDING SITE, designated SEQ ID:10463, to the nucleotide sequence of VGAM274 RNA, herein designated VGAM RNA, also designated SEQ ID:2985.

[15624] A function of VGAM274 is therefore inhibition of SRB7 Suppressor of RNA Polymerase B Homolog (yeast) (SURB7, Accession NM_004264). Accordingly, utilities of VGAM274 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SURB7. LOC221035 (Accession XM_167640) is another VGAM274 host target gene. LOC221035 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221035, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221035 BINDING SITE, designated SEQ ID:44745, to the nucleotide sequence of VGAM274 RNA, herein designated VGAM RNA, also designated SEQ ID:2985.

[15625] Another function of VGAM274 is therefore inhibition of LOC221035 (Accession XM_167640). Accordingly, utilities of VGAM274 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221035. LOC221405 (Accession XM_168138) is another VGAM274 host target gene. LOC221405 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221405, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221405 BINDING SITE, designated SEQ ID:45065, to the nucleotide sequence of VGAM274 RNA, herein designated VGAM RNA, also designated SEQ ID:2985.

[15626] Another function of VGAM274 is therefore inhibition of LOC221405 (Accession XM_168138). Accordingly, utilities of VGAM274 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221405. LOC51701 (Accession NM_016231) is another VGAM274 host target gene. LOC51701 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51701, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51701 BINDING SITE, designated SEQ ID:18344, to the nucleotide sequence of VGAM274 RNA, herein designated VGAM RNA, also designated SEQ ID:2985.

[15627] Another function of VGAM274 is therefore inhibition of LOC51701 (Accession NM_016231). Accordingly, utilities of VGAM274 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51701. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 275 (VGAM275) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15628] VGAM275 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM275 was detected is described hereinabove with reference to Figs. 1–8.

[15629] VGAM275 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM275 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15630] VGAM275 gene encodes a VGAM275 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM275 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM275 precursor RNA is designated SEQ ID:261, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:261 is located at position 65605 relative to the genome of Epiphyas Postvittana Nucleopolyhedrovirus.

[15631] VGAM275 precursor RNA folds onto itself, forming VGAM275 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15632] An enzyme complex designated DICER COMPLEX, `dices` the VGAM275 folded precursor RNA into VGAM275 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM275 RNA is designated SEQ ID:2986, and is provided hereinbelow with reference to the sequence listing part.

[15633] VGAM275 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM275 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM275 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15634] VGAM275 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM275 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM275 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM275 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM275 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[15635] The complementary binding of VGAM275 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM275 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM275 host target RNA into VGAM275 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15636] It is appreciated that VGAM275 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM275 host target genes. The mRNA of each one of this plurality of VGAM275 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM275 RNA, herein designated VGAM RNA, and which when bound by VGAM275 RNA causes inhibition of translation of respective one or more VGAM275 host target proteins.

[15637] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM275 gene, herein designated VGAM GENE, on one or more VGAM275 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15638] It is yet further appreciated that a function of VGAM275 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM275 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM275 correlate with, and may be deduced from, the identity of the host target genes which VGAM275 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15639] Nucleotide sequences of the VGAM275 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM275 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM275 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM275 are further described hereinbelow with reference to Table 1.

[15640] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM275 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM275 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15641] As mentioned hereinabove with reference to Fig. 1, a function of VGAM275 gene, herein designated VGAM is inhibition of expression of VGAM275 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM275 correlate with, and may be deduced from, the identity of the target genes which VGAM275 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15642] Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 5 (SLC9A5, Accession XM_007868) is a VGAM275 host target gene. SLC9A5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by SLC9A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC9A5 BINDING SITE, designated SEQ ID:30066, to the nucleotide sequence of VGAM275 RNA, herein designated VGAM RNA, also designated SEQ ID:2986.

[15643] A function of VGAM275 is therefore inhibition of Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 5 (SLC9A5, Accession XM_007868). Accordingly, utilities of VGAM275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC9A5. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 276 (VGAM276) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15644] VGAM276 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM276 was detected is described hereinabove with reference to Figs. 1–8.

[15645] VGAM276 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM276 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15646] VGAM276 gene encodes a VGAM276 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM276 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM276 precursor RNA is designated SEQ ID:262, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:262 is located at position 19006 relative to the genome of Epiphyas Postvittana Nucleopolyhedrovirus.

[15647] VGAM276 precursor RNA folds onto itself, forming VGAM276 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15648] An enzyme complex designated DICER COMPLEX, `dices` the VGAM276 folded precursor RNA into VGAM276 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM276 RNA is designated SEQ ID:2987, and is provided hereinbelow with reference to the sequence listing part.

[15649] VGAM276 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM276 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM276 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15650] VGAM276 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM276 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM276 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM276 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM276 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15651] The complementary binding of VGAM276 RNA, herein designated VGAM RNA, to host target binding sites on VGAM276 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM276 host tar-

get RNA into VGAM276 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15652] It is appreciated that VGAM276 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM276 host target genes. The mRNA of each one of this plurality of VGAM276 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM276 RNA, herein designated VGAM RNA, and which when bound by VGAM276 RNA causes inhibition of translation of respective one or more VGAM276 host target proteins.

[15653] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM276 gene, herein designated VGAM GENE, on one or more VGAM276 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15654] It is yet further appreciated that a function of VGAM276 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM276 correlate with, and may be deduced from, the identity of the host target genes which VGAM276 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15655] Nucleotide sequences of the VGAM276 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM276 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM276 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM276 are further

described hereinbelow with reference to Table 1.

[15656] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM276 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM276 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15657] As mentioned hereinabove with reference to Fig. 1, a function of VGAM276 gene, herein designated VGAM is inhibition of expression of VGAM276 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM276 correlate with, and may be deduced from, the identity of the target genes which VGAM276 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15658] Fibroblast Growth Factor 5 (FGF5, Accession NM_004464) is a VGAM276 host target gene. FGF5 BINDING SITE1 and FGF5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGF5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

FGF5 BINDING SITE1 and FGF5 BINDING SITE2, designated SEQ ID:10773 and SEQ ID:27000 respectively, to the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA, also designated SEQ ID:2987.

[15659] A function of VGAM276 is therefore inhibition of Fibroblast Growth Factor 5 (FGF5, Accession NM_004464), a gene which induces transformation and may regulate neuronal differentiation. Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF5. The function of FGF5 has been established by previous studies. Zhan et al. (1988) identified a fifth oncogene related to fibroblast growth factors and termed it FGF5. The other four are FGFA (OMIM Ref. No. 131220), FGFB (OMIM Ref. No. 134920), INT2 (OMIM Ref. No. 164950), and HST (OMIM Ref. No. 164980). FGF5 was discovered when it acquired transforming potential by a DNA rearrangement accompanying transfection of NIH 3T3 cells with human tumor DNA. Two regions of the FGF5 sequence, containing 122 of its 267 amino acid residues, were 40 to 50% homologous to the sequences of the 4 other members of the FGF oncogene family. FGF5, furthermore, was found to have a 3-exon structure typical for members of this family. FGF5

was found to be expressed in neonatal brain and in 3 of 13 human tumor cell lines examined. Nguyen et al. (1988) mapped FGF5 to 4q21 by in situ hybridization. Thus, it is not in the same cluster as the related HST and INT2 genes, which are coamplified in some tumor cells and were found by Nguyen et al. (1988), using pulsed field gel analysis, to be separated by only 40 kb. By polymerase chain reaction (PCR) amplification of target sequences in DNAs from somatic cell hybrids, Dionne et al. (1990) mapped the FGF5 gene to chromosome 4. By in situ chromosomal hybridization, Mattei et al. (1992) demonstrated that the corresponding gene in the mouse is on chromosome 5. Hebert et al. (1994) found that mice homozygous for a null allele of the *Fgf5* gene, produced by gene targeting in embryonic stem cells, have abnormally long hair. This phenotype appeared identical to that of mice homozygous for the spontaneous mutation 'angora' (*go*). The transgenic mutant and the '*go*' mutant failed to complement one another, and exon 1 of *Fgf5* was found to be deleted in DNA from *go* homozygotes. Expression of *Fgf5* is detected in hair follicles from wildtype mice and is localized to the outer root sheath during the anagen VI phase of the hair growth cycle. The findings were interpreted as evi-

dence that FGF5 functions as an inhibitor of hair elongation, thus identifying a molecule whose normal function is apparently to regulate one step in the progression of the follicle through the hair growth cycle. It will be of interest to search for mutations in the FGF5 gene in hypertrichosis universalis (145700, 145701) as well as in other forms of hypertrichosis such as hairy elbows (OMIM Ref. No. 139600).

[15660] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15661] Zhan, X.; Bates, B.; Hu, X.; Goldfarb, M. : The human FGF-5 oncogene encodes a novel protein related to fibroblast growth factors. *Molec. Cell. Biol.* 8: 3487-3495, 1988. ; and

[15662] Hebert, J. M.; Rosenquist, T.; Gotz, J.; Martin, G. R. : FGF5 as a regulator of the hair growth cycle: evidence from targeted and spontaneous mutations. *Cell* 78: 1017-1025, 1994.

[15663] Further studies establishing the function and utilities of FGF5 are found in John Hopkins OMIM database record ID 165190, and in cited publications numbered 698-699, 17 and 700-701 listed in the bibliography section hereinbe-

low, which are also hereby incorporated by reference. Nuclear Receptor Interacting Protein 1 (NRIP1, Accession XM_009699) is another VGAM276 host target gene. NRIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NRIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRIP1 BINDING SITE, designated SEQ ID:30118, to the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA, also designated SEQ ID:2987.

[15664] Another function of VGAM276 is therefore inhibition of Nuclear Receptor Interacting Protein 1 (NRIP1, Accession XM_009699), a gene which modulates transcriptional activation by the estrogen receptor. Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRIP1. The function of NRIP1 has been established by previous studies. Cavailles et al. (1995) identified the receptor-interacting protein 140 (OMIM Ref. No. RIP140) by virtue of its direct association with a transcriptional activation domain of the estrogen receptor (ESR; 133430) in the presence of estrogen; by fluorescence in situ hybridization

with a cDNA clone, they mapped the gene to 21q11. Katsanis et al. (1998) used hybrids, YACs, and PACs to place the RIP140 gene on the physical map of chromosome 21; 21q11 is a gene-poor region.

[15665] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15666] Cavailles, V.; Dauvois, S.; Horset, L. F.; Lopez, G.; Hoare, S.; Kushner, P. J.; Parker, M. G. : Nuclear factor RIP140 modulates transcriptional activation by the estrogen receptor. EMBO J. 14: 3741–3751, 1995. ; and

[15667] Katsanis, N.; Ives, J. H.; Groet, J.; Nizetic, D.; Fisher, E. M. C. : Localisation of receptor interacting protein 140 (RIP140) within 100 kb of D21S13 on 21q11, a gene-poor region of t.

[15668] Further studies establishing the function and utilities of NRIP1 are found in John Hopkins OMIM database record ID 602490, and in cited publications numbered 1036–1037 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. PBX/knotted 1 Homeobox 1 (PKNOX1, Accession NM_004571) is another VGAM276 host target gene. PKNOX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by PKNOX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKNOX1 BINDING SITE, designated SEQ ID:10913, to the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA, also designated SEQ ID:2987.

[15669] Another function of VGAM276 is therefore inhibition of PBX/knotted 1 Homeobox 1 (PKNOX1, Accession NM_004571), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKNOX1. The function of PKNOX1 has been established by previous studies. As part of developing a transcript map of human chromosome 21, Chen et al. (1997) used exon trapping to identify portions of genes from chromosome 21-specific cosmids. They identified a trapped exon that is identical to a region of the human expressed sequence tag (EST) L12425. Using the exon and EST as probes, they screened human fetal brain and kidney cDNA libraries and cloned the corresponding gene, which encodes a homeodomain-containing polypeptide of 436 amino acids. Chen et al.

(1997) used the EST as a probe for Northern analysis and detected transcripts of 2.5 and 5 kb in every human tissue examined, including heart, brain and brain subregions, placenta, lung, liver, muscle, and several fetal tissues. The gene, designated PBX/knotted-1 homeo box-1 (OMIM Ref. No. PKNOX1), has a homeodomain closely related to those of the mammalian PBX family (such as mouse Meis1) and the plant knotted-1 family (involved in plant development). Chen et al. (1997) used PCR amplification, hybridization, and genetic linkage analysis to map PKNOX1 to 21q22.3 between markers D21S212 and D21S25 on YAC350F7. By fluorescence in situ hybridization, Berthelsen et al. (1998) mapped the PKNOX1 gene to human chromosome 21q22.3 and mouse chromosome 17B/C.

[15670] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15671] Berthelsen, J.; Viggiano, L.; Schulz, H.; Ferretti, E.; Gonzalez, G. G.; Rocchi, M.; Blasi, F. : PKNOX1, a gene encoding PREP1, a new regulator of Pbx activity, maps on human chromosome 21q22.3 and murine chromosome 17B/C. Genomics 47: 323-324, 1998. ; and

[15672] Chen, H.; Rossier, C.; Nakamura, Y.; Lynn, A.; Chakravarti, A.; Antonarakis, S. E. : Cloning of a novel homeobox-containing gene, PKNOX1, and mapping to human chromosome 21q22.3. Genomi.

[15673] Further studies establishing the function and utilities of PKNOX1 are found in John Hopkins OMIM database record ID 602100, and in cited publications numbered 8527–8528 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TIA1 Cytotoxic Granule-associated RNA Binding Protein (TIA1, Accession NM_022173) is another VGAM276 host target gene. TIA1 BINDING SITE1 and TIA1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TIA1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIA1 BINDING SITE1 and TIA1 BINDING SITE2, designated SEQ ID:22734 and SEQ ID:22559 respectively, to the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA, also designated SEQ ID:2987.

[15674] Another function of VGAM276 is therefore inhibition of TIA1 Cytotoxic Granule-associated RNA Binding Protein

(TIA1, Accession NM_022173), a gene which possesses nucleolytic activity against cytotoxic lymphocyte target cells. Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIA1. The function of TIA1 has been established by previous studies. Cytolytic lymphocytes (CTLs) are characterized by their inclusion of cytoplasmic granules containing effector molecules that can mediate target cell death. One mechanism of lymphocyte-mediated killing is the induction of target cell apoptosis. Central to this autolytic pathway is the activation of an endogenous endonuclease that degrades target cell DNA. TIA1 is a 15-kD cytoplasmic granule-associated protein whose expression is restricted to CTLs and natural killer cells (Anderson et al., 1990). Upon activation with mitogens or with antibodies reactive with the T-cell receptor complex, the expression of TIA1 greatly increases and 28-, 40-, and 53-kD forms of the protein are induced. Tian et al. (1991) described the cDNA cloning and functional characterization of 2 TIA1 isoforms. By immunoscreening a cytolytic T-cell cDNA expression library with a monoclonal antibody against TIA1, they isolated a 1.6-kb TIA1 cDNA encoding a deduced 146-amino acid protein,

referred to as rp15-TIA1, that has an apparent molecular mass of 15 kD by SDS-PAGE. Using the 1.6-kb cDNA to screen a phytohemagglutinin-activated T-cell cDNA library, the authors isolated a 2.2-kb cDNA encoding a deduced 375-amino acid protein, referred to as rp40-TIA1, that has an apparent molecular mass of 40 kD by SDS-PAGE. The 1.6-kb cDNA is identical in sequence to the last 1,618 bp of the 2.2-kb cDNA. The rp40-TIA1 protein contains 3 RNA-binding domains, each with 2 ribonucleoprotein consensus octapeptide sequences, at the N terminus, and a glutamine-rich domain and a lysosomal membrane-targeting motif at the C terminus; the rp15-TIA1 protein contains the glutamine-rich domain and the lysosomal membrane-targeting motif. Tian et al. (1991) suggested that the 15-kD TIA1 isoform may be derived from the 40-kD isoform by proteolytic processing and showed that peripheral blood lymphocytes express a protease capable of specifically cleaving rp40-TIA1, resulting in the release of its 15-kD C terminus. The authors demonstrated that TIA1 is a nucleic acid-binding protein that preferentially recognizes poly(A) homopolymers, and induces DNA fragmentation in permeabilized thymocytes. They suggested that TIA1 may be involved in the induc-

tion of apoptosis in CTL targets. Northern blot analysis detected 2.7- and 4.0-kb TIA1 transcripts in lymphocytes and 1.7-, 2.2-, 2.7-, and 4.0-kb TIA1 transcripts in a cytotoxic T-cell clone. Forch et al. (2000) reported that the apoptosis-promoting protein TIA1 regulates alternative pre-mRNA splicing of the *Drosophila* male-specific lethal-2 gene (*Msl2*; OMIM Ref. No. 604880) and of the human apoptotic gene *FAS* (*TNFRSF6*; 134637). TIA1 associates selectively with pre-mRNAs that contain 5-prime splice sites followed by U-rich sequences. TIA1 binding to the U-rich stretches facilitates 5-prime splice site recognition by U1 snRNP (see OMIM Ref. No. 180740). This activity is critical for activation of the weak 5-prime splice site of *Msl2* and for modulating the choice of splice site partner in *FAS*. Structural and functional similarities with the *S. cerevisiae* splicing factor *Nam8* suggest striking evolutionary conservation of a mechanism of pre-mRNA splicing regulation that controls biologic processes as diverse as meiosis in yeast, dosage compensation in fruit flies, or programmed cell death in humans.

[15675] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [15676] Tian, Q.; Streuli, M.; Saito, H.; Schlossman, S. F.; Anderson, P. : A polyadenylate binding protein localized to the granules of cytolytic lymphocytes induces DNA fragmentation in target cells. *Cell* 67: 629–639, 1991. ; and
- [15677] Forch, P.; Puig, O.; Kedersha, N.; Martinez, C.; Granneman, S.; Seraphin, B.; Anderson, P.; Valcarcel, J. : The apoptosis-promoting factor TIA-1 is a regulator of alternative pre-mRNA s.
- [15678] Further studies establishing the function and utilities of TIA1 are found in John Hopkins OMIM database record ID 603518, and in cited publications numbered 8669–8672 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZp434A2417 (Accession XM_038526) is another VGAM276 host target gene. DKFZp434A2417 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434A2417, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434A2417 BINDING SITE, designated SEQ ID:32862, to the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA, also designated SEQ ID:2987.

[15679] Another function of VGAM276 is therefore inhibition of DKFZp434A2417 (Accession XM_038526). Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434A2417. DKFZp761B1514 (Accession NM_032288) is another VGAM276 host target gene. DKFZp761B1514 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761B1514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761B1514 BINDING SITE, designated SEQ ID:26046, to the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA, also designated SEQ ID:2987.

[15680] Another function of VGAM276 is therefore inhibition of DKFZp761B1514 (Accession NM_032288). Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761B1514. FLJ20136 (Accession NM_017684) is another VGAM276 host target gene. FLJ20136 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20136, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20136 BINDING SITE, designated SEQ ID:19228, to the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA, also designated SEQ ID:2987.

[15681] Another function of VGAM276 is therefore inhibition of FLJ20136 (Accession NM_017684). Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20136. KIAA0410 (Accession NM_014778) is another VGAM276 host target gene. KIAA0410 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0410, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0410 BINDING SITE, designated SEQ ID:16617, to the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA, also designated SEQ ID:2987.

[15682] Another function of VGAM276 is therefore inhibition of KIAA0410 (Accession NM_014778). Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0410. KIAA1908 (Accession XM_055834) is another VGAM276 host target gene. KIAA1908 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1908, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1908 BINDING SITE, designated SEQ ID:36329, to the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA, also designated SEQ ID:2987.

[15683] Another function of VGAM276 is therefore inhibition of KIAA1908 (Accession XM_055834). Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1908. Paternally Expressed 10 (PEG10, Accession NM_015068) is another VGAM276 host target gene. PEG10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PEG10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEG10 BINDING SITE, designated SEQ

ID:17427, to the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA, also designated SEQ ID:2987.

[15684] Another function of VGAM276 is therefore inhibition of Paternally Expressed 10 (PEG10, Accession NM_015068). Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEG10. PHD Finger Protein 7 (PHF7, Accession NM_016483) is another VGAM276 host target gene. PHF7 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PHF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHF7 BINDING SITE, designated SEQ ID:18580, to the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA, also designated SEQ ID:2987.

[15685] Another function of VGAM276 is therefore inhibition of PHD Finger Protein 7 (PHF7, Accession NM_016483). Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHF7. Proline-rich Gla (G-carboxyglutamic acid) Polypeptide 1 (PRRG1, Accession NM_000950) is an-

other VGAM276 host target gene. PRRG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRRG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRRG1 BINDING SITE, designated SEQ ID:6651, to the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA, also designated SEQ ID:2987.

[15686] Another function of VGAM276 is therefore inhibition of Proline-rich Gla (G-carboxyglutamic acid) Polypeptide 1 (PRRG1, Accession NM_000950). Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRRG1. LOC129198 (Accession XM_072197) is another VGAM276 host target gene. LOC129198 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC129198, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129198 BINDING SITE, designated SEQ ID:37463, to the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA,

also designated SEQ ID:2987.

[15687] Another function of VGAM276 is therefore inhibition of LOC129198 (Accession XM_072197). Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129198. LOC145719 (Accession XM_096848) is another VGAM276 host target gene. LOC145719 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145719 BINDING SITE, designated SEQ ID:40571, to the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA, also designated SEQ ID:2987.

[15688] Another function of VGAM276 is therefore inhibition of LOC145719 (Accession XM_096848). Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145719. LOC145720 (Accession XM_096846) is another VGAM276 host target gene. LOC145720 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145720, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145720 BINDING SITE, designated SEQ ID:40561, to the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA, also designated SEQ ID:2987.

[15689] Another function of VGAM276 is therefore inhibition of LOC145720 (Accession XM_096846). Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145720. LOC158295 (Accession XM_098915) is another VGAM276 host target gene. LOC158295 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158295 BINDING SITE, designated SEQ ID:41938, to the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA, also designated SEQ ID:2987.

[15690] Another function of VGAM276 is therefore inhibition of LOC158295 (Accession XM_098915). Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC158295. LOC197114 (Accession XM_116987) is another VGAM276 host target gene. LOC197114 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC197114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197114 BINDING SITE, designated SEQ ID:43185, to the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA, also designated SEQ ID:2987.

[15691] Another function of VGAM276 is therefore inhibition of LOC197114 (Accession XM_116987). Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197114. LOC197117 (Accession XM_116989) is another VGAM276 host target gene. LOC197117 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC197117, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197117 BINDING SITE, designated SEQ ID:43194, to

the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA, also designated SEQ ID:2987.

[15692] Another function of VGAM276 is therefore inhibition of LOC197117 (Accession XM_116989). Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197117. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 277 (VGAM277) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15693] VGAM277 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM277 was detected is described hereinabove with reference to Figs. 1–8.

[15694] VGAM277 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM277 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15695] VGAM277 gene encodes a VGAM277 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM277 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM277 precursor RNA is designated SEQ ID:263, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:263 is located at position 54634 relative to the genome of Epi-phyas Postvittana Nucleopolyhedrovirus.

[15696] VGAM277 precursor RNA folds onto itself, forming VGAM277 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15697] An enzyme complex designated DICER COMPLEX, `dices` the VGAM277 folded precursor RNA into VGAM277 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM277 RNA is designated SEQ ID:2988, and is provided hereinbelow with reference to the sequence listing part.

[15698] VGAM277 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM277 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM277 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15699] VGAM277 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM277 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM277 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM277 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM277 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15700] The complementary binding of VGAM277 RNA, herein designated VGAM RNA, to host target binding sites on VGAM277 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM277 host target RNA into VGAM277 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15701] It is appreciated that VGAM277 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM277 host target genes. The mRNA of each one of this plurality of VGAM277 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM277 RNA, herein designated VGAM RNA, and which when bound by VGAM277 RNA causes inhibition of translation of respective one or more VGAM277 host target proteins.

[15702] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM277 gene, herein designated VGAM GENE, on one or more VGAM277 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[15703] It is yet further appreciated that a function of VGAM277 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM277 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM277 correlate with, and may be deduced from, the identity of the host target genes which VGAM277 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15704] Nucleotide sequences of the VGAM277 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM277 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM277 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM277 are further described hereinbelow with reference to Table 1.

[15705] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM277 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM277 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15706] As mentioned hereinabove with reference to Fig. 1, a function of VGAM277 gene, herein designated VGAM is inhibition of expression of VGAM277 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM277 correlate with, and may be deduced from, the identity of the target genes which VGAM277 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15707] DNA (cytosine-5-)-methyltransferase 2 (DNMT2, Accession NM_004412) is a VGAM277 host target gene. DNMT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNMT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNMT2 BINDING SITE, designated SEQ ID:10673, to the nucleotide sequence of VGAM277 RNA, herein designated VGAM RNA, also designated SEQ ID:2988.

[15708] A function of VGAM277 is therefore inhibition of DNA (cytosine-5-)-methyltransferase 2 (DNMT2, Accession

NM_004412), a gene which may mark specific sequences in the genome . Accordingly, utilities of VGAM277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNMT2. The function of DNMT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM177. ELL (Accession NM_006532) is another VGAM277 host target gene. ELL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELL BINDING SITE, designated SEQ ID:13281, to the nucleotide sequence of VGAM277 RNA, herein designated VGAM RNA, also designated SEQ ID:2988.

[15709] Another function of VGAM277 is therefore inhibition of ELL (Accession NM_006532). Accordingly, utilities of VGAM277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELL. Mitogen-activated Protein Kinase Kinase Kinase 7 Interacting Protein 2 (MAP3K7IP2, Accession NM_015093) is another VGAM277 host target gene. MAP3K7IP2 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP3K7IP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K7IP2 BINDING SITE, designated SEQ ID:17489, to the nucleotide sequence of VGAM277 RNA, herein designated VGAM RNA, also designated SEQ ID:2988.

[15710] Another function of VGAM277 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 7 Inter-acting Protein 2 (MAP3K7IP2, Accession NM_015093). Accordingly, utilities of VGAM277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K7IP2. Mitochondrial Ribosomal Protein L49 (MRPL49, Accession XM_045499) is another VGAM277 host target gene. MRPL49 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPL49, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL49 BINDING SITE, designated SEQ ID:34477, to the nucleotide sequence of VGAM277 RNA, herein designated VGAM RNA,

also designated SEQ ID:2988.

[15711] Another function of VGAM277 is therefore inhibition of Mitochondrial Ribosomal Protein L49 (MRPL49, Accession XM_045499). Accordingly, utilities of VGAM277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL49. Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_007331) is another VGAM277 host target gene. WHSC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WHSC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE, designated SEQ ID:14248, to the nucleotide sequence of VGAM277 RNA, herein designated VGAM RNA, also designated SEQ ID:2988.

[15712] Another function of VGAM277 is therefore inhibition of Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_007331), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1. The function of WHSC1 and its association with various diseases

and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.CGI-203 (Accession NM_020408) is another VGAM277 host target gene. CGI-203 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CGI-203, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGI-203 BINDING SITE, designated SEQ ID:21676, to the nucleotide sequence of VGAM277 RNA, herein designated VGAM RNA, also designated SEQ ID:2988.

[15713] Another function of VGAM277 is therefore inhibition of CGI-203 (Accession NM_020408). Accordingly, utilities of VGAM277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGI-203. CCR4-NOT Transcription Complex, Subunit 8 (CNOT8, Accession NM_004779) is another VGAM277 host target gene. CNOT8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CNOT8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of CNOT8 BINDING SITE, designated SEQ ID:11178, to the nucleotide sequence of VGAM277 RNA, herein designated VGAM RNA, also designated SEQ ID:2988.

[15714] Another function of VGAM277 is therefore inhibition of CCR4–NOT Transcription Complex, Subunit 8 (CNOT8, Accession NM_004779). Accordingly, utilities of VGAM277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNOT8. FLJ21709 (Accession XM_085480) is another VGAM277 host target gene. FLJ21709 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21709 BINDING SITE, designated SEQ ID:38173, to the nucleotide sequence of VGAM277 RNA, herein designated VGAM RNA, also designated SEQ ID:2988.

[15715] Another function of VGAM277 is therefore inhibition of FLJ21709 (Accession XM_085480). Accordingly, utilities of VGAM277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21709.

FLJ21939 (Accession NM_022461) is another VGAM277 host target gene. FLJ21939 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21939 BINDING SITE, designated SEQ ID:22802, to the nucleotide sequence of VGAM277 RNA, herein designated VGAM RNA, also designated SEQ ID:2988.

[15716] Another function of VGAM277 is therefore inhibition of FLJ21939 (Accession NM_022461). Accordingly, utilities of VGAM277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21939. LOC152503 (Accession XM_098238) is another VGAM277 host target gene. LOC152503 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152503, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152503 BINDING SITE, designated SEQ ID:41519, to the nucleotide sequence of VGAM277 RNA, herein designated VGAM RNA,

also designated SEQ ID:2988.

[15717] Another function of VGAM277 is therefore inhibition of LOC152503 (Accession XM_098238). Accordingly, utilities of VGAM277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152503. LOC152897 (Accession XM_087555) is another VGAM277 host target gene. LOC152897 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152897, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152897 BINDING SITE, designated SEQ ID:39328, to the nucleotide sequence of VGAM277 RNA, herein designated VGAM RNA, also designated SEQ ID:2988.

[15718] Another function of VGAM277 is therefore inhibition of LOC152897 (Accession XM_087555). Accordingly, utilities of VGAM277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152897. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 278 (VGAM278) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15719] VGAM278 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM278 was detected is described hereinabove with reference to Figs. 1–8.

[15720] VGAM278 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM278 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15721] VGAM278 gene encodes a VGAM278 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM278 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM278 precursor RNA is designated SEQ ID:264, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:264 is located at position 17046 relative to the genome of Epiphyas Postvittana Nucleopolyhedrovirus.

[15722] VGAM278 precursor RNA folds onto itself, forming

VGAM278 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15723] An enzyme complex designated DICER COMPLEX, `dices` the VGAM278 folded precursor RNA into VGAM278 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM278 RNA is designated SEQ ID:2989, and is provided hereinbelow with reference to the sequence listing part.

[15724] VGAM278 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM278 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM278 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[15725] VGAM278 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM278 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM278 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM278 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM278 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15726] The complementary binding of VGAM278 RNA, herein designated VGAM RNA, to host target binding sites on VGAM278 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM278 host target RNA into VGAM278 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15727] It is appreciated that VGAM278 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM278 host target genes. The mRNA of each one of this plurality of VGAM278 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM278 RNA, herein designated VGAM RNA, and which when bound by VGAM278 RNA causes inhibition of translation of respective one or more VGAM278 host target proteins.

[15728] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM278 gene, herein designated VGAM GENE, on one or more VGAM278 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15729] It is yet further appreciated that a function of VGAM278 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM278 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM278 correlate with, and may be deduced from, the identity of the host target genes which

VGAM278 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15730] Nucleotide sequences of the VGAM278 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM278 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM278 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM278 are further described hereinbelow with reference to Table 1.

[15731] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM278 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM278 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15732] As mentioned hereinabove with reference to Fig. 1, a function of VGAM278 gene, herein designated VGAM is inhibition of expression of VGAM278 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM278 correlate with, and may be deduced from, the identity of the target genes which VGAM278 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[15733] Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 dunce homolog, *Drosophila*) (PDE4D, Accession XM_056815) is a VGAM278 host target gene. PDE4D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE4D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4D BINDING SITE, designated SEQ ID:36426, to the nucleotide sequence of VGAM278 RNA, herein designated VGAM RNA, also designated SEQ ID:2989.

[15734] A function of VGAM278 is therefore inhibition of Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 dunce homolog, *Drosophila*) (PDE4D, Accession XM_056815), a gene which has similarity to *Drosophila* dnc, which is the affected protein in learning and memory mutant dunce. Accordingly, utilities of VGAM278 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4D. The function of PDE4D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM180. Transient Receptor Potential Cation Channel, Subfamily C, Member 6 (TRPC6, Accession NM_004621) is another VGAM278 host target gene. TRPC6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TRPC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPC6 BINDING SITE, designated SEQ ID:10977, to the nucleotide sequence of VGAM278 RNA, herein designated VGAM RNA, also designated SEQ ID:2989.

[15735] Another function of VGAM278 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily C, Member 6 (TRPC6, Accession NM_004621), a gene which has calcium channel activity. Accordingly, utilities of VGAM278 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPC6. The function of TRPC6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 279 (VGAM279) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15736] VGAM279 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM279 was detected is described hereinabove with reference to Figs. 1–8.

[15737] VGAM279 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM279 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15738] VGAM279 gene encodes a VGAM279 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM279 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM279 precursor RNA is designated SEQ ID:265, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:265 is located at position 12207 relative to the genome of Epiphyas Postvittana Nucleopolyhedrovirus.

[15739] VGAM279 precursor RNA folds onto itself, forming VGAM279 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15740] An enzyme complex designated DICER COMPLEX, `dices` the VGAM279 folded precursor RNA into VGAM279 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM279 RNA is designated SEQ ID:2990, and is provided hereinbelow with reference to the sequence listing part.

[15741] VGAM279 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM279 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM279 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15742] VGAM279 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM279 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM279 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM279 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM279 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15743] The complementary binding of VGAM279 RNA, herein designated VGAM RNA, to host target binding sites on VGAM279 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM279 host target RNA into VGAM279 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15744] It is appreciated that VGAM279 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM279 host target genes. The mRNA of each one of this plurality of VGAM279 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM279 RNA, herein designated VGAM RNA, and which when bound by VGAM279 RNA causes inhibition of translation of respective one or more VGAM279 host target proteins.

[15745] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM279 gene, herein designated VGAM GENE, on one or more VGAM279 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15746] It is yet further appreciated that a function of VGAM279 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM279 correlate with, and may be deduced

from, the identity of the host target genes which VGAM279 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15747] Nucleotide sequences of the VGAM279 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM279 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM279 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM279 are further described hereinbelow with reference to Table 1.

[15748] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM279 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM279 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15749] As mentioned hereinabove with reference to Fig. 1, a function of VGAM279 gene, herein designated VGAM is inhibition of expression of VGAM279 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM279 correlate with, and may be deduced from, the identity of the target genes which VGAM279

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15750] DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 6 (RNA helicase, 54kDa) (DDX6, Accession NM_004397) is a VGAM279 host target gene. DDX6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX6 BINDING SITE, designated SEQ ID:10647, to the nucleotide sequence of VGAM279 RNA, herein designated VGAM RNA, also designated SEQ ID:2990.

[15751] A function of VGAM279 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 6 (RNA helicase, 54kDa) (DDX6, Accession NM_004397), a gene which is putative RNA helicases. Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX6. The function of DDX6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179. Engulfment and Cell Motility 2 (ced-12 ho-

molog, *C. elegans*) (ELMO2, Accession NM_133171) is another VGAM279 host target gene. ELMO2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELMO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELMO2 BINDING SITE, designated SEQ ID:28395, to the nucleotide sequence of VGAM279 RNA, herein designated VGAM RNA, also designated SEQ ID:2990.

[15752] Another function of VGAM279 is therefore inhibition of Engulfment and Cell Motility 2 (*ced-12* homolog, *C. elegans*) (ELMO2, Accession NM_133171). Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELMO2. Hepatocyte Growth Factor (hepatopoietin A; scatter factor) (HGF, Accession XM_168542) is another VGAM279 host target gene. HGF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HGF BINDING SITE, designated

SEQ ID:45230, to the nucleotide sequence of VGAM279 RNA, herein designated VGAM RNA, also designated SEQ ID:2990.

[15753] Another function of VGAM279 is therefore inhibition of Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM_168542), a gene which may be required for normal embryonic development; strongly similar to murine Hgf, has kringle domains. Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HGF. The function of HGF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM174. Rho GTPase Activating Protein 5 (ARHGAP5, Accession XM_085082) is another VGAM279 host target gene. ARHGAP5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ARHGAP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP5 BINDING SITE, designated SEQ ID:37822, to the nucleotide sequence of VGAM279 RNA, herein designated VGAM RNA, also designated SEQ

ID:2990.

[15754] Another function of VGAM279 is therefore inhibition of Rho GTPase Activating Protein 5 (ARHGAP5, Accession XM_085082). Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP5. DKFZP434P0721 (Accession XM_033181) is another VGAM279 host target gene. DKFZP434P0721 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434P0721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P0721 BINDING SITE, designated SEQ ID:31872, to the nucleotide sequence of VGAM279 RNA, herein designated VGAM RNA, also designated SEQ ID:2990.

[15755] Another function of VGAM279 is therefore inhibition of DKFZP434P0721 (Accession XM_033181). Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P0721. FLJ13189 (Accession NM_024882) is another VGAM279 host target gene. FLJ13189 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by FLJ13189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13189 BINDING SITE, designated SEQ ID:24334, to the nucleotide sequence of VGAM279 RNA, herein designated VGAM RNA, also designated SEQ ID:2990.

[15756] Another function of VGAM279 is therefore inhibition of FLJ13189 (Accession NM_024882). Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13189. FLJ20456 (Accession NM_017831) is another VGAM279 host target gene. FLJ20456 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20456, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20456 BINDING SITE, designated SEQ ID:19494, to the nucleotide sequence of VGAM279 RNA, herein designated VGAM RNA, also designated SEQ ID:2990.

[15757] Another function of VGAM279 is therefore inhibition of FLJ20456 (Accession NM_017831). Accordingly, utilities of

VGAM279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20456. FLJ20695 (Accession NM_017929) is another VGAM279 host target gene. FLJ20695 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20695, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20695 BINDING SITE, designated SEQ ID:19613, to the nucleotide sequence of VGAM279 RNA, herein designated VGAM RNA, also designated SEQ ID:2990.

[15758] Another function of VGAM279 is therefore inhibition of FLJ20695 (Accession NM_017929). Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20695. KIAA1754 (Accession XM_032587) is another VGAM279 host target gene. KIAA1754 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1754, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1754 BINDING SITE,

designated SEQ ID:31682, to the nucleotide sequence of VGAM279 RNA, herein designated VGAM RNA, also designated SEQ ID:2990.

[15759] Another function of VGAM279 is therefore inhibition of KIAA1754 (Accession XM_032587). Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1754. Nucleosome Assembly Protein 1-like 2 (NAP1L2, Accession NM_021963) is another VGAM279 host target gene. NAP1L2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NAP1L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAP1L2 BINDING SITE, designated SEQ ID:22497, to the nucleotide sequence of VGAM279 RNA, herein designated VGAM RNA, also designated SEQ ID:2990.

[15760] Another function of VGAM279 is therefore inhibition of Nucleosome Assembly Protein 1-like 2 (NAP1L2, Accession NM_021963). Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAP1L2. LOC150159

(Accession NM_139173) is another VGAM279 host target gene. LOC150159 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150159, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150159 BINDING SITE, designated SEQ ID:29182, to the nucleotide sequence of VGAM279 RNA, herein designated VGAM RNA, also designated SEQ ID:2990.

[15761] Another function of VGAM279 is therefore inhibition of LOC150159 (Accession NM_139173). Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150159. LOC164714 (Accession XM_104657) is another VGAM279 host target gene. LOC164714 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC164714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164714 BINDING SITE, designated SEQ ID:42180, to the nucleotide sequence of VGAM279 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2990.

[15762] Another function of VGAM279 is therefore inhibition of LOC164714 (Accession XM_104657). Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164714. LOC196485 (Accession XM_113731) is another VGAM279 host target gene. LOC196485 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196485, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196485 BINDING SITE, designated SEQ ID:42383, to the nucleotide sequence of VGAM279 RNA, herein designated VGAM RNA, also designated SEQ ID:2990.

[15763] Another function of VGAM279 is therefore inhibition of LOC196485 (Accession XM_113731). Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196485. LOC199858 (Accession XM_114040) is another VGAM279 host target gene. LOC199858 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199858, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199858 BINDING SITE, designated SEQ ID:42636, to the nucleotide sequence of VGAM279 RNA, herein designated VGAM RNA, also designated SEQ ID:2990.

[15764] Another function of VGAM279 is therefore inhibition of LOC199858 (Accession XM_114040). Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199858. LOC202986 (Accession XM_117489) is another VGAM279 host target gene. LOC202986 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202986, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202986 BINDING SITE, designated SEQ ID:43474, to the nucleotide sequence of VGAM279 RNA, herein designated VGAM RNA, also designated SEQ ID:2990.

[15765] Another function of VGAM279 is therefore inhibition of LOC202986 (Accession XM_117489). Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC202986. LOC222060 (Accession XM_168427) is another VGAM279 host target gene. LOC222060 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222060, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222060 BINDING SITE, designated SEQ ID:45159, to the nucleotide sequence of VGAM279 RNA, herein designated VGAM RNA, also designated SEQ ID:2990.

[15766] Another function of VGAM279 is therefore inhibition of LOC222060 (Accession XM_168427). Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222060. LOC222160 (Accession XM_168431) is another VGAM279 host target gene. LOC222160 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222160 BINDING SITE, designated SEQ ID:45168, to

the nucleotide sequence of VGAM279 RNA, herein designated VGAM RNA, also designated SEQ ID:2990.

[15767] Another function of VGAM279 is therefore inhibition of LOC222160 (Accession XM_168431). Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222160. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 280 (VGAM280) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15768] VGAM280 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM280 was detected is described hereinabove with reference to Figs. 1–8.

[15769] VGAM280 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM280 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15770] VGAM280 gene encodes a VGAM280 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM280 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM280 precursor RNA is designated SEQ ID:266, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:266 is located at position 110345 relative to the genome of Epi-phyas Postvittana Nucleopolyhedrovirus.

[15771] VGAM280 precursor RNA folds onto itself, forming VGAM280 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15772] An enzyme complex designated DICER COMPLEX, `dices` the VGAM280 folded precursor RNA into VGAM280 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM280 RNA is designated SEQ ID:2991, and is provided hereinbelow with reference to the sequence listing part.

[15773] VGAM280 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM280 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM280 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15774] VGAM280 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM280 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM280 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM280 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM280 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15775] The complementary binding of VGAM280 RNA, herein designated VGAM RNA, to host target binding sites on VGAM280 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM280 host target RNA into VGAM280 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15776] It is appreciated that VGAM280 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM280 host target genes. The mRNA of each one of this plurality of VGAM280 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM280 RNA, herein designated VGAM RNA, and which when bound by VGAM280 RNA causes inhibition of translation of respective one or more VGAM280 host target proteins.

[15777] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM280 gene, herein designated VGAM GENE, on one or more VGAM280 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[15778] It is yet further appreciated that a function of VGAM280 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM280 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM280 correlate with, and may be deduced from, the identity of the host target genes which VGAM280 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15779] Nucleotide sequences of the VGAM280 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM280 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM280 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM280 are further described hereinbelow with reference to Table 1.

[15780] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM280 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM280 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15781] As mentioned hereinabove with reference to Fig. 1, a function of VGAM280 gene, herein designated VGAM is inhibition of expression of VGAM280 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM280 correlate with, and may be deduced from, the identity of the target genes which VGAM280 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15782] DNA (cytosine-5-)-methyltransferase 3 Beta (DNMT3B, Accession NM_006892) is a VGAM280 host target gene. DNMT3B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DNMT3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNMT3B BINDING SITE, designated SEQ ID:13764, to the nucleotide sequence of VGAM280 RNA, herein designated VGAM RNA, also designated SEQ ID:2991.

[15783] A function of VGAM280 is therefore inhibition of DNA

(cytosine-5-)-methyltransferase 3 Beta (DNMT3B, Accession NM_006892), a gene which is required for genome wide de novo methylation. Accordingly, utilities of VGAM280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNMT3B. The function of DNMT3B has been established by previous studies. Ehrlich et al. (2001) performed microarray expression analysis on B-cell lymphoblastoid cell lines from 5 ICF patients with diverse DNMT3B mutations and on control lymphoblastoid cell lines. They employed oligonucleotide arrays for approximately 5600 different genes, 510 of which showed a lymphoid lineage-restricted expression pattern among several different lineages tested. A set of 32 genes, half of which are thought to play a role in immune function, had consistent and significant ICF-specific changes in RNA levels. ICF-specific increases in immunoglobulin (Ig) heavy constant mu- and delta-RNA and cell surface IgM and IgD, decreases in Ig-gamma and Ig-alpha RNA, and surface IgG and IgA suggested inhibition of the later steps of lymphocyte maturation. ICF-specific increases were seen in RNA for RGS1 (OMIM Ref. No. 600323), a B-cell specific inhibitor of G-protein signaling implicated in negative regulation of B-cell migra-

tion, and in RNA for the proapoptotic protein kinase C ϵ gene (OMIM Ref. No. 605437). ICF-associated decreases were observed in RNAs encoding proteins involved in activation, migration, or survival of lymphoid cells, namely, transcription factor negative regulator ID3 (OMIM Ref. No. 600277), the enhancer-binding MEF2C (OMIM Ref. No. 600662), the iron regulatory TFRC (OMIM Ref. No. 190010), integrin beta-7 (ITGB7; 147559), the stress protein heme oxygenase (HMOX1; 141250), and the lymphocyte-specific tumor necrosis factor receptor family members 7 and 17 (TNFRSF7, 186711; TNFRSF17, 109545). No differences in promoter methylation were seen between ICF and normal lymphoblastoid cell lines for 3 ICF upregulated genes and 1 downregulated gene by a quantitative methylation assay. The authors hypothesized that DNMT3B mutations in the ICF syndrome may cause lymphogenesis-associated gene dysregulation by indirect effects on gene expression that interfere with normal lymphocyte signaling, maturation, and migration. Shirohzu et al. (2002) reported 3 Japanese cases of ICF syndrome from 2 unrelated families. All patients had typical facial dysmorphism and IgA deficiency, but none of them had apparent mental retardation. Cytogenetic analysis of pe-

peripheral blood lymphocytes showed chromosomal abnormalities, including multiradial configurations and a stretching of the pericentromeric heterochromatin of chromosomes 1 and 16. Hypomethylation of classical satellite-2 DNA was also observed. Three mutations in DNMT3B were found. One patient was a compound heterozygote for a gln42-to-ter (Q42X; 602900.0011) and an arg832-to-gln (R832Q; 602900.0012) mutation. The 2 patients from the second family were both homozygous for a ser282-to-pro (S282P; 602900.0013) mutation. Animal model experiments lend further support to the function of DNMT3B. Okano et al. (1999) generated mice with targeted disruption of the Dnmt3a and Dnmt3b genes. Inactivation of both genes blocked de novo methylation in embryonic stem cells and early embryos but had no effect on maintenance of imprinted methylation patterns.

Dnmt3a $-/-$ mice developed to term and appeared to be normal at birth. However, most homozygous mutant mice became runted and died at about 4 weeks of age. In contrast, no viable Dnmt3b $-/-$ mice were recovered at birth. Dissection of embryos at different stages of development revealed that Dnmt3b $-/-$ embryos had multiple developmental defects, including growth impairment and rostral

neural tube defects with variable severity at later stages of development, though most of them appeared to develop normally before E9.5. Dnmt3a and Dnmt3b also exhibited nonoverlapping functions in development, with Dnmt3b specifically required for methylation of centromeric minor satellite repeats. These results indicated that both Dnmt3a and Dnmt3b are required for genomewide de novo methylation and are essential for mammalian development.

[15784] It is appreciated that the abovementioned animal model for DNMT3B is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[15785] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15786] Ehrlich, M.; Buchanan, K. L.; Tsien, F.; Jiang, G.; Sun, B.; Uicker, W.; Weemaes, C. M. R.; Smeets, D.; Sperling, K.; Belohradsky, B. H.; Tommerup, N.; Misek, D. E.; Rouillard, J.-M.; Kuick, R.; Hanash, S. M. : DNA methyltransferase 3B mutations linked to the ICF syndrome cause dysregulation of lymphogenesis genes. Hum. Molec. Genet. 10: 2917–2931, 2001. ; and

[15787] Rhee, I.; Bachman, K. E.; Park, B. H.; Jair, K.-W.; Yen, R.-W. C.; Schuebel, K. E.; Cui, H.; Feinberg, A. P.; Lengauer, C.; Kinzler, K. W.; Baylin, S. B.; Vogelstein, B. : DNMT1 and DNM.

[15788] Further studies establishing the function and utilities of DNMT3B are found in John Hopkins OMIM database record ID 602900, and in cited publications numbered 5910, 5781-5782, 11685, 6216, 1168 and 11686 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mitogen-activated Protein Kinase Kinase 8 (MAP3K8, Accession NM_005204) is another VGAM280 host target gene. MAP3K8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAP3K8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K8 BINDING SITE, designated SEQ ID:11705, to the nucleotide sequence of VGAM280 RNA, herein designated VGAM RNA, also designated SEQ ID:2991.

[15789] Another function of VGAM280 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 8 (MAP3K8, Accession NM_005204), a gene which is able to

activate nf-kappa-b 1 by stimulating proteasome-mediated p. Accordingly, utilities of VGAM280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K8. The function of MAP3K8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM32.poly(A) Binding Protein, Cytoplasmic 1 (PABPC1, Accession NM_002568) is another VGAM280 host target gene. PABPC1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PABPC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PABPC1 BINDING SITE, designated SEQ ID:8420, to the nucleotide sequence of VGAM280 RNA, herein designated VGAM RNA, also designated SEQ ID:2991.

[15790] Another function of VGAM280 is therefore inhibition of poly(A) Binding Protein, Cytoplasmic 1 (PABPC1, Accession NM_002568), a gene which involves in cytoplasmic regulatory processes of mRNA metabolism. Accordingly, utilities of VGAM280 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with PABPC1. The function of PABPC1 has been established by previous studies. The poly(A)-binding protein (PABP), which is found complexed to the 3-prime poly(A) tail of eukaryotic mRNA, is required for poly(A) shortening and translation initiation. Grange et al. (1987) isolated a melanoma cell cDNA encoding human PABP. The predicted 633-amino acid protein contains 4 repeats of an approximately 80-amino acid unit in its N-terminal half. The authors found that this repeat region is highly conserved between human and yeast PABP and is sufficient for poly(A) binding. In vitro translation of the human PABP cDNA yielded a protein with an apparent molecular mass of 73 kD by SDS-PAGE. Northern blot analysis indicated that PABP is expressed as a 2.9-kb mRNA in human melanoma cells. Gorlach et al. (1994) noted that each of the 4 repeats of PABP is a ribonucleoprotein (RNP) consensus sequence RNA-binding domain. They determined that PABP has a pI of approximately 10.3 and is a very abundant, stable protein. Immunofluorescence studies of mammalian cells indicated that PABP is located exclusively in the cytoplasm. However, using both indirect immunofluorescence and tagging of PABP1 by fusion to the

green fluorescent protein (GFP), Afonina et al. (1998) demonstrated that PABP1 shuttles between the nucleus and cytoplasm. PABP1 accumulated in the nucleus when transcription was inhibited, suggesting that active transcription is required for nuclear export of PABP1. Deletion mutagenesis showed that the RNA binding ability of PABP1 is important for nuclear retention. Afonina et al. (1998) suggested that PABP1 is involved in nuclear events associated with the formation and transport of mRNP to the cytoplasm. Deo et al. (1999) determined the cocrystal structure of human PABP at 2.6-angstrom resolution. PABP recognizes the 3-prime mRNA poly(A) tail and plays critical roles in eukaryotic translation initiation and mRNA stabilization/degradation. The minimal PABP used by Deo et al. (1999) consisted of the N-terminal 2 RRM-type RNA-binding domains connected by a short linker (collectively referred to as RRM1/2). These 2 RRMs form a continuous RNA-binding trough lined by an antiparallel beta sheet backed by 4 alpha helices. The polyadenylate RNA adopts an extended conformation running the length of the molecular trough. Adenine recognition is primarily mediated by contacts with conserved residues found in the RNP motifs of the 2 RRMs. The convex dorsum of

RRM1/2 displays a phylogenetically conserved hydrophobic/acidic portion, which may interact with translation initiation factors and regulatory proteins

[15791] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15792] Gorlach, M.; Burd, C. G.; Dreyfuss, G. : The mRNA poly(A)-binding protein: localization, abundance, and RNA-binding specificity. *Exp. Cell Res.* 211: 400-407, 1994. ; and

[15793] Deo, R. C.; Bonanno, J. B.; Sonenberg, N.; Burley, S. K. : Recognition of polyadenylate RNA by the poly(A)-binding protein. *Cell* 98: 835-845, 1999.

[15794] Further studies establishing the function and utilities of PABPC1 are found in John Hopkins OMIM database record ID 604679, and in cited publications numbered 7941-7942, 5300, 7943-794 and 11608 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 8 (sodium-calcium exchanger), Member 2 (SLC8A2, Accession XM_038970) is another VGAM280 host target gene. SLC8A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

SLC8A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC8A2 BINDING SITE, designated SEQ ID:32970, to the nucleotide sequence of VGAM280 RNA, herein designated VGAM RNA, also designated SEQ ID:2991.

[15795] Another function of VGAM280 is therefore inhibition of Solute Carrier Family 8 (sodium–calcium exchanger), Member 2 (SLC8A2, Accession XM_038970). Accordingly, utilities of VGAM280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC8A2. FLJ13855 (Accession NM_023079) is another VGAM280 host target gene. FLJ13855 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ13855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13855 BINDING SITE, designated SEQ ID:23343, to the nucleotide sequence of VGAM280 RNA, herein designated VGAM RNA, also designated SEQ ID:2991.

[15796] Another function of VGAM280 is therefore inhibition of

FLJ13855 (Accession NM_023079). Accordingly, utilities of VGAM280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13855. FLJ14431 (Accession NM_032783) is another VGAM280 host target gene. FLJ14431 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14431, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14431 BINDING SITE, designated SEQ ID:26528, to the nucleotide sequence of VGAM280 RNA, herein designated VGAM RNA, also designated SEQ ID:2991.

[15797] Another function of VGAM280 is therefore inhibition of FLJ14431 (Accession NM_032783). Accordingly, utilities of VGAM280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14431. KIAA0373 (Accession NM_014684) is another VGAM280 host target gene. KIAA0373 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0373 BINDING SITE, designated SEQ ID:16184, to the nucleotide sequence of VGAM280 RNA, herein designated VGAM RNA, also designated SEQ ID:2991.

[15798] Another function of VGAM280 is therefore inhibition of KIAA0373 (Accession NM_014684). Accordingly, utilities of VGAM280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0373. Meningioma Expressed Antigen 6 (coiled-coil proline-rich) (MGEA6, Accession NM_005930) is another VGAM280 host target gene. MGEA6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGEA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGEA6 BINDING SITE, designated SEQ ID:12560, to the nucleotide sequence of VGAM280 RNA, herein designated VGAM RNA, also designated SEQ ID:2991.

[15799] Another function of VGAM280 is therefore inhibition of Meningioma Expressed Antigen 6 (coiled-coil proline-rich) (MGEA6, Accession NM_005930). Accordingly, utilities of VGAM280 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGEA6. LOC116349 (Accession XM_057993) is another VGAM280 host target gene. LOC116349 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116349, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116349 BINDING SITE, designated SEQ ID:36556, to the nucleotide sequence of VGAM280 RNA, herein designated VGAM RNA, also designated SEQ ID:2991.

[15800] Another function of VGAM280 is therefore inhibition of LOC116349 (Accession XM_057993). Accordingly, utilities of VGAM280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116349. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 281 (VGAM281) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15801] VGAM281 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM281 was detected is described hereinabove with reference to Figs. 1–8.

[15802] VGAM281 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM281 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15803] VGAM281 gene encodes a VGAM281 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM281 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM281 precursor RNA is designated SEQ ID:267, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:267 is located at position 83939 relative to the genome of Epiphyas Postvittana Nucleopolyhedrovirus.

[15804] VGAM281 precursor RNA folds onto itself, forming VGAM281 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15805] An enzyme complex designated DICER COMPLEX, `dices` the VGAM281 folded precursor RNA into VGAM281 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM281 RNA is designated SEQ ID:2992, and is provided hereinbelow with reference to the sequence listing part.

[15806] VGAM281 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM281 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM281 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15807] VGAM281 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM281 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM281 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM281 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM281 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15808] The complementary binding of VGAM281 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM281 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM281 host target RNA into VGAM281 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15809] It is appreciated that VGAM281 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM281 host target genes. The mRNA of each one of this plurality of VGAM281 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM281 RNA, herein designated VGAM RNA, and which when bound by VGAM281 RNA causes inhibition of translation of respective one or more VGAM281 host target proteins.

[15810] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM281 gene, herein designated VGAM GENE, on one or more VGAM281 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15811] It is yet further appreciated that a function of VGAM281 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM281 correlate with, and may be deduced from, the identity of the host target genes which VGAM281 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15812] Nucleotide sequences of the VGAM281 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

5' duced 5' VGAM281 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM281 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM281 are further described hereinbelow with reference to Table 1.

[15813] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM281 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM281 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15814] As mentioned hereinabove with reference to Fig. 1, a function of VGAM281 gene, herein designated VGAM is inhibition of expression of VGAM281 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM281 correlate with, and may be deduced from, the identity of the target genes which VGAM281 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15815] CD28 Antigen (Tp44) (CD28, Accession NM_006139) is a VGAM281 host target gene. CD28 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by CD28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD28 BINDING SITE, designated SEQ ID:12786, to the nucleotide sequence of VGAM281 RNA, herein designated VGAM RNA, also designated SEQ ID:2992.

[15816] A function of VGAM281 is therefore inhibition of CD28 Antigen (Tp44) (CD28, Accession NM_006139), a gene which possibly involved in t-cell activation. Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD28. The function of CD28 has been established by previous studies. Monoclonal antibodies recognize 3 antigens, CD3 (OMIM Ref. No. 186790), CD2 (OMIM Ref. No. 186990), and CD28 (Tp44), that cause human T cells to proliferate in the presence of phorbol esters. Whereas CD3 appeared to be involved in transduction of the signal generated by antigen binding to the T-cell receptor, the role of the CD2 and CD28 antigens in physiologic proliferation was not understood. Aruffo and Seed (1987) isolated a cDNA clone encoding CD28 by a simple and highly efficient cloning strategy based on transient expression.

In COS cells the CD28 encodes a highly glycosylated membrane protein with homology to the immunoglobulin superfamily. Animal model experiments lend further support to the function of CD28. CD28 undergoes tyrosine phosphorylation after interacting with its ligand, B7 (CD80; 112203). Phosphorylation of tyr173 (tyr170 in mouse) in the cytoplasmic domain of CD28 allows the recruitment of signaling proteins such as phosphatidylinositol 3-kinase (see OMIM Ref. No. PIK3R1; 171833), GRB2 (OMIM Ref. No. 108355), and GADS (GRAP2; 604518) via their SH2 domains. Okkenhaug et al. (2001) reconstituted CD28 knockout mice with transgenes encoding wildtype Cd28 or Cd28 carrying a tyr170-to-phe mutation. Mutant Cd28 did not bind to the SH2 domain of PIK3R1, resulting in diminished protein kinase B (OMIM Ref. No. 164730) activation. Mutant Cd28 was able to prevent the induction of anergy, to promote T-cell proliferation and interleukin-2 (IL2; 147680) secretion, and to provide B-cell help, but was unable to upregulate expression of the prosurvival protein BCLXL (OMIM Ref. No. 600039). The defect in BCLXL upregulation was correlated with increased susceptibility of the T cells to gamma radiation. Okkenhaug et al. (2001) suggested that other tyrosine residues or asn172

may be critical to functions not affected by the tyr170-to-phe mutation.

[15817] It is appreciated that the abovementioned animal model for CD28 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[15818] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15819] Aruffo, A.; Seed, B. : Molecular cloning of a CD28 cDNA by a high-efficiency COS cell expression system. Proc. Nat. Acad. Sci. 84: 8573-8577, 1987. ; and

[15820] Okkenhaug, K.; Wu, L.; Garza, K. M.; La Rose, J.; Khoo, W.; Odermatt, B.; Mak, T. W.; Ohashi, P. S.; Rottapel, R. : A point mutation in CD28 distinguishes proliferative signals from sur.

[15821] Further studies establishing the function and utilities of CD28 are found in John Hopkins OMIM database record ID 186760, and in cited publications numbered 5673-435 and 5674-5677 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Insulin Receptor Substrate 1 (IRS1, Accession NM_005544) is another VGAM281 host target gene. IRS1

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IRS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRS1 BINDING SITE, designated SEQ ID:12069, to the nucleotide sequence of VGAM281 RNA, herein designated VGAM RNA, also designated SEQ ID:2992.

[15822] Another function of VGAM281 is therefore inhibition of Insulin Receptor Substrate 1 (IRS1, Accession NM_005544), a gene which may mediate the control of various cellular processes by insulin. Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRS1. The function of IRS1 has been established by previous studies. Sun et al. (1991) isolated cDNAs encoding a 160- to 185-kD phosphotyrosyl protein that is a substrate of the insulin receptor tyrosine kinase and a putative participant in insulin (INS; 176730) signaling. This protein, designated insulin receptor substrate-1 (IRS1), is found in a variety of insulin responsive cells and tissues. It exhibits no intrinsic enzyme activity but is believed to serve as a docking protein involved in binding and activating other

signal transduction molecules after being phosphorylated on tyrosine by the insulin receptor kinase Almind et al. (1996) examined insulin-stimulated processes in a cultured myeloid progenitor cell stably overexpressing the insulin receptor when transfected with either wildtype human IRS1 or the gly972-to-arg common variant (numbering according to Nishiyama and Wands, 1992). They showed that the mutation in codon 972 of the IRS1 gene impairs insulin-stimulated signaling, especially along the phosphatidylinositol 3-kinase (OMIM Ref. No. 171834) pathway, and may contribute to insulin resistance in normal and diabetic populations. Animal model experiments lend further support to the function of IRS1. Clancy et al. (2001) found that mutation of chico extends fruit fly lifespan by up to 48% in homozygotes and 36% in heterozygotes. Extension of lifespan was not a result of impaired oogenesis in chico females, nor was it consistently correlated with increased stress resistance. The dwarf phenotype of chico homozygotes was also unnecessary for extension of lifespan. The role of insulin/IGF signaling in regulating animal aging is therefore evolutionarily conserved

[15823] It is appreciated that the abovementioned animal model

for IRS1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[15824] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15825] Esposito, D. L.; Mammarella, S.; Ranieri, A.; Loggia, F. D.; Capani, F.; Consoli, A.; Mariani-Costantini, R.; Caramia, F. G.; Cama, A.; Battista, P. : Deletion of gly723 in the insulin receptor substrate-1 of a patient with noninsulin-dependent diabetes mellitus. Hum. Mutat. 7: 364-366, 1996. ; and

[15826] Almind, K.; Inoue, G.; Pedersen, O.; Kahn, C. R. : A common amino acid polymorphism in insulin receptor substrate-1 causes impaired insulin signaling: evidence from transfection studies.

[15827] Further studies establishing the function and utilities of IRS1 are found in John Hopkins OMIM database record ID 147545, and in cited publications numbered 129-135, 445 and 4459-4472 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Lymphoid Enhancer-binding Factor 1 (LEF1, Accession NM_016269) is another VGAM281 host target gene.

LEF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LEF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEF1 BINDING SITE, designated SEQ ID:18393, to the nucleotide sequence of VGAM281 RNA, herein designated VGAM RNA, also designated SEQ ID:2992.

[15828] Another function of VGAM281 is therefore inhibition of Lymphoid Enhancer-binding Factor 1 (LEF1, Accession NM_016269), a gene which plays an essential role in the formation of several organs and structures that require inductive tissue interactions. Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEF1. The function of LEF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. Matrix Metalloproteinase 19 (MMP19, Accession NM_022790) is another VGAM281 host target gene. MMP19 BINDING SITE1 and MMP19 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MMP19, corresponding to HOST

TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP19 BINDING SITE1 and MMP19 BINDING SITE2, designated SEQ ID:23078 and SEQ ID:8270 respectively, to the nucleotide sequence of VGAM281 RNA, herein designated VGAM RNA, also designated SEQ ID:2992.

[15829] Another function of VGAM281 is therefore inhibition of Matrix Metalloproteinase 19 (MMP19, Accession NM_022790). Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP19. Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063) is another VGAM281 host target gene. EML4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EML4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EML4 BINDING SITE, designated SEQ ID:21143, to the nucleotide sequence of VGAM281 RNA, herein designated VGAM RNA, also designated SEQ ID:2992.

[15830] Another function of VGAM281 is therefore inhibition of

Echinoderm Microtubule Associated Protein Like 4 (EML4, Accession NM_019063). Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EML4. FLJ22969 (Accession XM_044006) is another VGAM281 host target gene. FLJ22969 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22969, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22969 BINDING SITE, designated SEQ ID:34066, to the nucleotide sequence of VGAM281 RNA, herein designated VGAM RNA, also designated SEQ ID:2992.

[15831] Another function of VGAM281 is therefore inhibition of FLJ22969 (Accession XM_044006). Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22969. FLJ23153 (Accession NM_024636) is another VGAM281 host target gene. FLJ23153 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23153 BINDING SITE, designated SEQ ID:23906, to the nucleotide sequence of VGAM281 RNA, herein designated VGAM RNA, also designated SEQ ID:2992.

[15832] Another function of VGAM281 is therefore inhibition of FLJ23153 (Accession NM_024636). Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23153. FLJ30567 (Accession NM_145022) is another VGAM281 host target gene. FLJ30567 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ30567, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30567 BINDING SITE, designated SEQ ID:29635, to the nucleotide sequence of VGAM281 RNA, herein designated VGAM RNA, also designated SEQ ID:2992.

[15833] Another function of VGAM281 is therefore inhibition of FLJ30567 (Accession NM_145022). Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30567.

KIAA1946 (Accession XM_092459) is another VGAM281 host target gene. KIAA1946 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1946, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1946 BINDING SITE, designated SEQ ID:40122, to the nucleotide sequence of VGAM281 RNA, herein designated VGAM RNA, also designated SEQ ID:2992.

[15834] Another function of VGAM281 is therefore inhibition of KIAA1946 (Accession XM_092459). Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1946. Phosphodiesterase 11A (PDE11A, Accession NM_016953) is another VGAM281 host target gene. PDE11A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDE11A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE11A BINDING SITE, designated SEQ ID:18869, to the nucleotide sequence of VGAM281 RNA,

herein designated VGAM RNA, also designated SEQ ID:2992.

[15835] Another function of VGAM281 is therefore inhibition of Phosphodiesterase 11A (PDE11A, Accession NM_016953). Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE11A. TUCAN (Accession NM_014959) is another VGAM281 host target gene. TUCAN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TUCAN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUCAN BINDING SITE, designated SEQ ID:17320, to the nucleotide sequence of VGAM281 RNA, herein designated VGAM RNA, also designated SEQ ID:2992.

[15836] Another function of VGAM281 is therefore inhibition of TUCAN (Accession NM_014959). Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUCAN. LOC118851 (Accession XM_061180) is another VGAM281 host target gene. LOC118851 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of

mRNA encoded by LOC118851, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118851 BINDING SITE, designated SEQ ID:37205, to the nucleotide sequence of VGAM281 RNA, herein designated VGAM RNA, also designated SEQ ID:2992.

[15837] Another function of VGAM281 is therefore inhibition of LOC118851 (Accession XM_061180). Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118851. LOC144742 (Accession XM_084949) is another VGAM281 host target gene. LOC144742 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144742, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144742 BINDING SITE, designated SEQ ID:37778, to the nucleotide sequence of VGAM281 RNA, herein designated VGAM RNA, also designated SEQ ID:2992.

[15838] Another function of VGAM281 is therefore inhibition of LOC144742 (Accession XM_084949). Accordingly, utilities

of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144742. LOC147353 (Accession XM_097227) is another VGAM281 host target gene. LOC147353 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147353, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147353 BINDING SITE, designated SEQ ID:40838, to the nucleotide sequence of VGAM281 RNA, herein designated VGAM RNA, also designated SEQ ID:2992.

[15839] Another function of VGAM281 is therefore inhibition of LOC147353 (Accession XM_097227). Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147353. LOC221687 (Accession XM_166423) is another VGAM281 host target gene. LOC221687 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC221687 BINDING SITE, designated SEQ ID:44301, to the nucleotide sequence of VGAM281 RNA, herein designated VGAM RNA, also designated SEQ ID:2992.

[15840] Another function of VGAM281 is therefore inhibition of LOC221687 (Accession XM_166423). Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221687. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 282 (VGAM282) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15841] VGAM282 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM282 was detected is described hereinabove with reference to Figs. 1–8.

[15842] VGAM282 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM282 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15843] VGAM282 gene encodes a VGAM282 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM282 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM282 precursor RNA is designated SEQ ID:268, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:268 is located at position 78903 relative to the genome of Epi-phyas Postvittana Nucleopolyhedrovirus.

[15844] VGAM282 precursor RNA folds onto itself, forming VGAM282 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15845] An enzyme complex designated DICER COMPLEX, `dices` the VGAM282 folded precursor RNA into VGAM282 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM282 RNA is designated SEQ ID:2993, and is provided hereinbelow with reference to the sequence listing part.

[15846] VGAM282 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM282 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM282 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15847] VGAM282 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM282 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM282 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM282 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM282 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[15848] The complementary binding of VGAM282 RNA, herein designated VGAM RNA, to host target binding sites on VGAM282 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM282 host target RNA into VGAM282 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15849] It is appreciated that VGAM282 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM282 host target genes. The mRNA of each one of this plurality of VGAM282 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM282 RNA, herein designated VGAM RNA, and which when bound by VGAM282 RNA causes inhibition of translation of respective one or more VGAM282 host target proteins.

[15850] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM282 gene, herein designated VGAM GENE, on one or more VGAM282 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[15851] It is yet further appreciated that a function of VGAM282 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM282 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM282 correlate with, and may be deduced from, the identity of the host target genes which VGAM282 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15852] Nucleotide sequences of the VGAM282 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM282 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM282 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM282 are further described hereinbelow with reference to Table 1.

[15853] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM282 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM282 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15854] As mentioned hereinabove with reference to Fig. 1, a function of VGAM282 gene, herein designated VGAM is inhibition of expression of VGAM282 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM282 correlate with, and may be deduced from, the identity of the target genes which VGAM282 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15855] Arachidonate 15-lipoxygenase (ALOX15, Accession NM_001140) is a VGAM282 host target gene. ALOX15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALOX15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALOX15 BINDING SITE, designated SEQ ID:6810, to the nucleotide sequence of VGAM282 RNA, herein designated VGAM RNA, also designated SEQ ID:2993.

[15856] A function of VGAM282 is therefore inhibition of Arachidonate 15-lipoxygenase (ALOX15, Accession NM_001140), a gene which converts arachidonic acid to 15s- hydroperoxyeicosatetraenoic acid. Accordingly, utilities of VGAM282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALOX15. The function of ALOX15 has been established by previous studies. Yoshimoto et al. (1990) found that the amino acid sequence of human reticulocyte 15-lipoxygenase (Sigal et al., 1988) showed 86% identity with that of porcine leukocyte 12-lipoxygenase (OMIM Ref. No. 152391). Sigal et al. (1988) found 61% sequence similarity between 15-lipoxygenase and 5-lipoxygenase (OMIM Ref. No. 152390). This suggests that in the human 12-lipoxygenase is more closely related evolutionarily to 15-lipoxygenase than to 5-lipoxygenase, even though the comparisons are made between human and porcine enzymes. By PCR analysis of a human-hamster somatic hybrid DNA panel, Funk et al. (1992) demonstrated that genes for 12-lipoxygenase and 15-lipoxygenase are located on human chromosome 17, whereas the most unrelated lipoxygenase (5-lipoxygenase) was mapped to chromosome 10. Kelavkar and Badr (1999) stated that the

ALOX15 gene maps to 17p13.3 in close proximity to the tumor-suppressor gene TP53 (OMIM Ref. No. 191170). The ALOX15 gene product is implicated in antiinflammation, membrane remodeling, and cancer development/metastasis. Kelavkar and Badr (1999) described experiments yielding data that supported the hypothesis that loss of the TP53 gene, or gain-of-function activities resulting from the expression of its mutant forms, regulates ALOX15 promoter activity in human and in mouse, albeit in directionally opposite manners. These studies defined a direct link between ALOX15 gene activity and an established tumor-suppressor gene located in close chromosomal proximity. Kelavkar and Badr (1999) referred to this as evidence that 15-lipoxygenase is a mutator gene.

[15857] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15858] Kelavkar, U. P.; Badr, K. F. : Effects of mutant p53 expression on human 15-lipoxygenase-promoter activity and murine 12/15-lipoxygenase gene expression: evidence that 15-lipoxygenase is a mutator gene. Proc. Nat. Acad. Sci. 96: 4378-4383, 1999. ; and

Yokoyama, C.; Tanabe, T. : Cloning and sequence analysis of the cDNA for arachidonate 12-lipoxygenase of porcine leukocytes. Proc. Na.

[15860] Further studies establishing the function and utilities of ALOX15 are found in John Hopkins OMIM database record ID 152392, and in cited publications numbered 169 and 3430–3432 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Deleted In Azoospermia (DAZ, Accession NM_004081) is another VGAM282 host target gene. DAZ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DAZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAZ BINDING SITE, designated SEQ ID:10281, to the nucleotide sequence of VGAM282 RNA, herein designated VGAM RNA, also designated SEQ ID:2993.

[15861] Another function of VGAM282 is therefore inhibition of Deleted In Azoospermia (DAZ, Accession NM_004081), a gene which may play a role in the germ-cell-specific patterns of RNA splicing and storage. Accordingly, utilities of VGAM282 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with DAZ. The function of DAZ and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.Solute Carrier Family 6 (neurotransmitter transporter, glycine), Member 5 (SLC6A5, Accession NM_004211) is another VGAM282 host target gene. SLC6A5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLC6A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A5 BINDING SITE, designated SEQ ID:10417, to the nucleotide sequence of VGAM282 RNA, herein designated VGAM RNA, also designated SEQ ID:2993.

[15862] Another function of VGAM282 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter, glycine), Member 5 (SLC6A5, Accession NM_004211), a gene which terminates the action of glycine by its high affinity sodium-dependent reuptake into presynaptic terminals. Accordingly, utilities of VGAM282 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with SLC6A5. The function of SLC6A5 has been established by previous studies. The amino acid glycine is a major inhibitory neurotransmitter in the spinal cord, brainstem, and retina, where it exerts its effects on the strychnine-sensitive glycine receptors. In addition, glycine acts as a coagonist with glutamate at the N-methyl-D-aspartate (NMDA) receptors (see OMIM Ref. No. 138252). The termination of action of glycine, like that of most other neurotransmitters, is mediated by rapid reuptake into the presynaptic terminal or surrounding glial cells. Glycine transporters are members of the sodium/chloride-dependent transporter family, which share 40 to 50% amino acid similarity and are characterized by 12 putative transmembrane regions. Liu et al. (1993) isolated a rat brain cDNA encoding a novel glycine transporter, which they called GlyT2. They found that GlyT2 differs from GlyT1 (OMIM Ref. No. 601019) in molecular structure, tissue specificity, and pharmacologic properties. By PCR of a human brain cDNA library with primers based on conserved regions of the rat GlyT2 gene, Morrow et al. (1998) cloned a cDNA corresponding to human GLYT2. The predicted 797-amino acid human protein is 94% identical to rat GlyT2. When expressed in mammalian

cells, GLYT2 displayed high affinity glycine uptake. Northern blot analysis of central nervous system tissues revealed that the approximately 9.5-kb GLYT2 mRNA is expressed in medulla, and to a lesser extent in spinal cord and cerebellum. Morrow et al. (1998) stated that the previously characterized GLYT1 and GLYT2 localization patterns suggest that GLYT2 is responsible for the termination of neurotransmission at strychnine-sensitive glycinergic synapses, while the more widely expressed GLYT1 may play a role in regulation of glycine levels in NMDA receptor-mediated neurotransmission. Independently, Gallagher et al. (1999) isolated cDNAs encoding 3 isoforms of GLYT2

[15863] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15864] Liu, Q. R.; Lopez-Corcuera, B.; Mandiyan, S.; Nelson, H.; Nelson, N. : Cloning and expression of a spinal cord- and brain-specific glycine transporter with novel structural features. J. Biol. Chem. 268: 22802-22808, 1993. ; and

[15865] Morrow, J. A.; Collie, I. T.; Dunbar, D. R.; Walker, G. B.; Shahid, M.; Hill, D. R. : Molecular cloning and functional expression of the human glycine transporter GlyT2 and

chromosomal I.

[15866] Further studies establishing the function and utilities of SLC6A5 are found in John Hopkins OMIM database record ID 604159, and in cited publications numbered 427–42 and 7938 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Wolf–Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_133332) is another VGAM282 host target gene. WHSC1 BINDING SITE1 through WHSC1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WHSC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE1 through WHSC1 BINDING SITE3, designated SEQ ID:28450, SEQ ID:28467 and SEQ ID:17186 respectively, to the nucleotide sequence of VGAM282 RNA, herein designated VGAM RNA, also designated SEQ ID:2993.

[15867] Another function of VGAM282 is therefore inhibition of Wolf–Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_133332), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM282

include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1. The function of WHSC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. LOC150280 (Accession XM_086846) is another VGAM282 host target gene. LOC150280 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150280, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150280 BINDING SITE, designated SEQ ID:38912, to the nucleotide sequence of VGAM282 RNA, herein designated VGAM RNA, also designated SEQ ID:2993.

[15868] Another function of VGAM282 is therefore inhibition of LOC150280 (Accession XM_086846). Accordingly, utilities of VGAM282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150280. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 283 (VGAM283) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15869] VGAM283 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM283 was detected is described hereinabove with reference to Figs. 1–8.

[15870] VGAM283 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM283 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15871] VGAM283 gene encodes a VGAM283 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM283 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM283 precursor RNA is designated SEQ ID:269, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:269 is located at position 1023 relative to the genome of Epiphyas Postvittana Nucleopolyhedrovirus.

[15872] VGAM283 precursor RNA folds onto itself, forming

VGAM283 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15873] An enzyme complex designated DICER COMPLEX, `dices` the VGAM283 folded precursor RNA into VGAM283 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM283 RNA is designated SEQ ID:2994, and is provided hereinbelow with reference to the sequence listing part.

[15874] VGAM283 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM283 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM283 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15875] VGAM283 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM283 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM283 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM283 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM283 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15876] The complementary binding of VGAM283 RNA, herein designated VGAM RNA, to host target binding sites on VGAM283 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM283 host target RNA into VGAM283 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15877] It is appreciated that VGAM283 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM283 host target genes. The mRNA of each one of this plurality of VGAM283 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM283 RNA, herein designated VGAM RNA, and which when bound by VGAM283 RNA causes inhibition of translation of respective one or more VGAM283 host target proteins.

[15878] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM283 gene, herein designated VGAM GENE, on one or more VGAM283 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15879] It is yet further appreciated that a function of VGAM283 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM283 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM283 correlate with, and may be deduced from, the identity of the host target genes which

VGAM283 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15880] Nucleotide sequences of the VGAM283 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM283 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM283 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM283 are further described hereinbelow with reference to Table 1.

[15881] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM283 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM283 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15882] As mentioned hereinabove with reference to Fig. 1, a function of VGAM283 gene, herein designated VGAM is inhibition of expression of VGAM283 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM283 correlate with, and may be deduced from, the identity of the target genes which VGAM283 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[15883] Dual Adaptor of Phosphotyrosine and 3-phosphoinositides (DAPP1, Accession NM_014395) is a VGAM283 host target gene. DAPP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAPP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAPP1 BINDING SITE, designated SEQ ID:15731, to the nucleotide sequence of VGAM283 RNA, herein designated VGAM RNA, also designated SEQ ID:2994.

[15884] A function of VGAM283 is therefore inhibition of Dual Adaptor of Phosphotyrosine and 3-phosphoinositides (DAPP1, Accession NM_014395), a gene which regulates the ras-cyclic amp pathway. Accordingly, utilities of VGAM283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAPP1. The function of DAPP1 has been established by previous studies. By EST database searching for pleckstrin homology (PH) domain-containing proteins, followed by screening a universal cDNA library, Dowler et al. (1999) isolated a cDNA encoding DAPP1. Sequence analysis predicted that

the 280-amino acid protein contains a potential myristoylation site (a glycine after the N-terminal methionine), an N-terminal SH2 domain, and a C-terminal PH domain with a PtdIns-interacting motif. The authors noted that APS (OMIM Ref. No. 605300) also has an SH2 domain and a PH domain but at opposite termini of the protein. PCR of cDNA libraries and Northern blot analysis revealed ubiquitous expression of 2.7-kb transcripts, with highest levels in placenta and lung. A protein-lipid overlay analysis indicated that the PH domain of DAPP1 interacts with physiologic enantiomers of PtdIns. Using suppression subtractive hybridization with follicular dendritic cell tester cDNA, Marshall et al. (2000) cloned BAM32 and a splice variant identical to DAPP1. In addition to the SH2 and PH domains noted by Dowler et al. (1999), Marshall et al. (2000) predicted the presence of a potential tyrosine phosphorylation site in BAM32. Northern blot analysis detected an abundant 2.9-kb transcript and a minor 4.4-kb transcript in all hemopoietic tissues, as well as in trachea and placenta. RT-PCR analysis revealed expression in all B-cell lines, but not in T-cell, epithelial cell, fibroblast, or myelocytic leukemia cell lines. Activation of B cells was found to increase BAM32 expression. Immunoblot analysis

showed that stimulation also induces BAM32 association with PLCG2 (OMIM Ref. No. 600220) and tyrosine phosphorylation of a 36-kD protein. Confocal microscopy demonstrated a PI3K-dependent membrane localization of BAM32 after B-cell receptor (BCR) activation. Luciferase reporter analysis showed that expression of the PH domain of BAM32 inhibits BCR-induced activation of NFATC (see OMIM Ref. No. 600489).

[15885] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15886] Dowler, S.; Currie, R. A.; Downes, C. P.; Alessi, D. R. : DAPP1: a dual adaptor for phosphotyrosine and 3-phosphoinositides. *Biochem. J.* 342: 7-12, 1999. ; and

[15887] Marshall, A. J.; Niiro, H.; Lerner, C. G.; Yun, T. J.; Thomas, S.; Disteche, C. M.; Clark, E. A. : A novel B lymphocyte-associated adaptor protein, Bam32, regulates antigen receptor si.

[15888] Further studies establishing the function and utilities of DAPP1 are found in John Hopkins OMIM database record ID 605768, and in cited publications numbered 4506-4507 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fig. 1

further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 284 (VGAM284) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15889] VGAM284 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM284 was detected is described hereinabove with reference to Figs. 1–8.

[15890] VGAM284 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM284 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15891] VGAM284 gene encodes a VGAM284 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM284 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM284 precursor RNA is designated SEQ ID:270, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:270 is

located at position 5957 relative to the genome of Epi-
phyas Postvittana Nucleopolyhedrovirus.

[15892] VGAM284 precursor RNA folds onto itself, forming VGAM284 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15893] An enzyme complex designated DICER COMPLEX, `dices` the VGAM284 folded precursor RNA into VGAM284 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM284 RNA is designated SEQ ID:2995, and is provided hereinbelow with reference to the sequence listing part.

[15894] VGAM284 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM284 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM284 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[15895] VGAM284 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM284 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM284 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM284 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM284 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[15896] The complementary binding of VGAM284 RNA, herein designated VGAM RNA, to host target binding sites on VGAM284 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM284 host target RNA into VGAM284 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15897] It is appreciated that VGAM284 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM284 host target genes. The mRNA of each one of this plurality of VGAM284 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM284 RNA, herein designated VGAM RNA, and which when bound by VGAM284 RNA causes inhibition of translation of respective one or more VGAM284

host target proteins.

[15898] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM284 gene, herein designated VGAM GENE, on one or more VGAM284 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15899] It is yet further appreciated that a function of VGAM284 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM284 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucle-

opolyhedrovirus. Specific functions, and accordingly utilities, of VGAM284 correlate with, and may be deduced from, the identity of the host target genes which VGAM284 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15900] Nucleotide sequences of the VGAM284 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM284 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM284 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM284 are further described hereinbelow with reference to Table 1.

[15901] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM284 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM284 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15902] As mentioned hereinabove with reference to Fig. 1, a function of VGAM284 gene, herein designated VGAM is inhibition of expression of VGAM284 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM284 correlate with, and may be deduced from, the identity of the target genes which VGAM284 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15903] MGC12538 (Accession NM_032746) is a VGAM284 host target gene. MGC12538 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC12538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12538 BINDING SITE, designated SEQ ID:26479, to the nucleotide sequence of VGAM284 RNA, herein designated VGAM RNA, also designated SEQ ID:2995.

[15904] A function of VGAM284 is therefore inhibition of MGC12538 (Accession NM_032746). Accordingly, utilities of VGAM284 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12538. Nucleoporin 160kDa (NUP160, Accession XM_113678) is another VGAM284 host target gene. NUP160 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUP160, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUP160 BINDING SITE, designated SEQ ID:42327, to the nucleotide sequence of VGAM284 RNA, herein designated VGAM RNA, also designated SEQ ID:2995.

[15905] Another function of VGAM284 is therefore inhibition of Nucleoporin 160kDa (NUP160, Accession XM_113678). Accordingly, utilities of VGAM284 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUP160. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 285 (VGAM285) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15906] VGAM285 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM285 was detected is described hereinabove with reference to Figs. 1–8.

[15907] VGAM285 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana

Nucleopolyhedrovirus. VGAM285 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15908] VGAM285 gene encodes a VGAM285 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM285 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM285 precursor RNA is designated SEQ ID:271, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:271 is located at position 58647 relative to the genome of Epiphyas Postvittana Nucleopolyhedrovirus.

[15909] VGAM285 precursor RNA folds onto itself, forming VGAM285 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15910] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM285 folded precursor RNA into VGAM285 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM285 RNA is designated SEQ ID:2996, and is provided hereinbelow with reference to the sequence listing part.

[15911] VGAM285 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM285 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM285 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15912] VGAM285 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM285 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM285 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM285 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM285 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15913] The complementary binding of VGAM285 RNA, herein designated VGAM RNA, to host target binding sites on VGAM285 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM285 host target RNA into VGAM285 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15914] It is appreciated that VGAM285 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM285 host target genes. The mRNA of each one of this plurality of VGAM285 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM285 RNA, herein designated VGAM RNA, and which when bound by VGAM285 RNA causes inhibition of translation of respective one or more VGAM285 host target proteins.

[15915] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM285 gene, herein designated VGAM GENE, on one or more VGAM285 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15916] It is yet further appreciated that a function of VGAM285 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM285 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM285 correlate with, and may be deduced from, the identity of the host target genes which VGAM285 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15917] Nucleotide sequences of the VGAM285 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM285 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM285 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM285 are further described hereinbelow with reference to Table 1.

[15918] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM285 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM285 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15919] As mentioned hereinabove with reference to Fig. 1, a function of VGAM285 gene, herein designated VGAM is inhibition of expression of VGAM285 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM285 correlate with, and may be deduced from, the identity of the target genes which VGAM285 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15920] NEBL (Accession NM_006393) is a VGAM285 host target gene. NEBL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEBL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEBL BINDING SITE, designated SEQ ID:13100, to the nucleotide sequence of VGAM285 RNA, herein des-

ignated VGAM RNA, also designated SEQ ID:2996.

[15921] A function of VGAM285 is therefore inhibition of NEBL (Accession NM_006393). Accordingly, utilities of VGAM285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEBL. FLJ12389 (Accession XM_015274) is another VGAM285 host target gene. FLJ12389 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12389, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12389 BINDING SITE, designated SEQ ID:30235, to the nucleotide sequence of VGAM285 RNA, herein designated VGAM RNA, also designated SEQ ID:2996.

[15922] Another function of VGAM285 is therefore inhibition of FLJ12389 (Accession XM_015274). Accordingly, utilities of VGAM285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12389. FLJ20300 (Accession NM_017753) is another VGAM285 host target gene. FLJ20300 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20300, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20300 BINDING SITE, designated SEQ ID:19366, to the nucleotide sequence of VGAM285 RNA, herein designated VGAM RNA, also designated SEQ ID:2996.

[15923] Another function of VGAM285 is therefore inhibition of FLJ20300 (Accession NM_017753). Accordingly, utilities of VGAM285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20300. LOC147054 (Accession XM_097172) is another VGAM285 host target gene. LOC147054 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147054 BINDING SITE, designated SEQ ID:40795, to the nucleotide sequence of VGAM285 RNA, herein designated VGAM RNA, also designated SEQ ID:2996.

[15924] Another function of VGAM285 is therefore inhibition of LOC147054 (Accession XM_097172). Accordingly, utilities of VGAM285 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC147054. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 286 (VGAM286) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15925] VGAM286 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM286 was detected is described hereinabove with reference to Figs. 1–8.

[15926] VGAM286 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM286 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15927] VGAM286 gene encodes a VGAM286 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM286 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM286 precursor RNA is designated SEQ

ID:272, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:272 is located at position 4528 relative to the genome of Epi-phyas Postvittana Nucleopolyhedrovirus.

[15928] VGAM286 precursor RNA folds onto itself, forming VGAM286 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15929] An enzyme complex designated DICER COMPLEX, `dices` the VGAM286 folded precursor RNA into VGAM286 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM286 RNA is designated SEQ ID:2997, and is provided hereinbelow with reference to the sequence

listing part.

[15930] VGAM286 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM286 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM286 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15931] VGAM286 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM286 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM286 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM286 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM286 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15932] The complementary binding of VGAM286 RNA, herein designated VGAM RNA, to host target binding sites on VGAM286 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM286 host target RNA into VGAM286 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15933] It is appreciated that VGAM286 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM286 host target genes. The mRNA of each one of this plurality of VGAM286 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM286 RNA, herein designated VGAM

RNA, and which when bound by VGAM286 RNA causes inhibition of translation of respective one or more VGAM286 host target proteins.

[15934] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM286 gene, herein designated VGAM GENE, on one or more VGAM286 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15935] It is yet further appreciated that a function of VGAM286 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM286 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM286 correlate with, and may be deduced from, the identity of the host target genes which VGAM286 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15936] Nucleotide sequences of the VGAM286 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM286 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM286 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM286 are further described hereinbelow with reference to Table 1.

[15937] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM286 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM286 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15938] As mentioned hereinabove with reference to Fig. 1, a function of VGAM286 gene, herein designated VGAM is

inhibition of expression of VGAM286 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM286 correlate with, and may be deduced from, the identity of the target genes which VGAM286 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15939] Carcinoembryonic Antigen-related Cell Adhesion Molecule 6 (non-specific cross reacting antigen) (CEACAM6, Accession NM_002483) is a VGAM286 host target gene. CEACAM6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CEACAM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEACAM6 BINDING SITE, designated SEQ ID:8308, to the nucleotide sequence of VGAM286 RNA, herein designated VGAM RNA, also designated SEQ ID:2997.

[15940] A function of VGAM286 is therefore inhibition of Carcinoembryonic Antigen-related Cell Adhesion Molecule 6 (non-specific cross reacting antigen) (CEACAM6, Accession NM_002483), a gene which Non-specific cross reacting antigen (. Accordingly, utilities of VGAM286 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with CEACAM6. The function of CEACAM6 has been established by previous studies. Carcinoembryonic antigen (CEA; 114890) is one of the most widely used tumor markers in serum immunoassay determinations of carcinoma. An apparent lack of absolute cancer specificity for CEA probably results in part from the presence in normal and neoplastic tissues of antigens that share antigenic determinants with the 180-kD form of CEA. Barnett et al. (1988) presented sequences of a 'normal crossreacting antigen' (NCA) and showed that CEA and NCA, although closely related in sequence, are structurally and probably functionally distinct. Nomenclature: Beauchemin et al. (1999) provided a revised nomenclature for the CEA gene family. Based on this nomenclature, the CEA family is composed of the PSG subfamily (see OMIM Ref. No. 176392); the CEACAM subfamily, which includes CEACAM1 (BGP), CEACAM3 (CGM1), CEACAM4 (CGM7), CEACAM5 (CEA), CEACAM6 (NCA), CEACAM7 (CGM2), and CEACAM8 (CGM6); and the CEACAM pseudogene (CEACAMP) subfamily, CEACAMP1 through CEACAMP11, which had originally been named CGM8 through CGM18 (see OMIM Ref. No. 109770). The NCA gene was renamed

CEACAM6.

- [15941] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [15942] Barnett, T.; Goebel, S. J.; Nothdurft, M. A.; Elting, J. J. : Carcinoembryonic antigen family: characterization of cDNAs coding for NCA and CEA and suggestion of nonrandom sequence variation in their conserved loop-domains. *Genomics* 3: 59–66, 1988. ; and
- [15943] Beauchemin, N.; Draber, P.; Dveksler, G.; Gold, P.; Gray-Owen, S.; Grunert, F.; Hammarstrom, S.; Holmes, K. V.; Karlsson, A.; Kuroki, M.; Lin, S.-H.; Lucka, L.; and 13 others : Redefined.
- [15944] Further studies establishing the function and utilities of CEACAM6 are found in John Hopkins OMIM database record ID 163980, and in cited publications numbered 4 and 2240–2242 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Coagulation Factor C Homolog, Cochlin (*Limulus polyphemus*) (COCH, Accession NM_004086) is another VGAM286 host target gene. COCH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COCH, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COCH BINDING SITE, designated SEQ ID:10291, to the nucleotide sequence of VGAM286 RNA, herein designated VGAM RNA, also designated SEQ ID:2997.

[15945] Another function of VGAM286 is therefore inhibition of Coagulation Factor C Homolog, Cochlin (*Limulus polyphemus*) (COCH, Accession NM_004086). Accordingly, utilities of VGAM286 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COCH. JJAZ1 (Accession NM_015355) is another VGAM286 host target gene. JJAZ1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JJAZ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JJAZ1 BINDING SITE, designated SEQ ID:17653, to the nucleotide sequence of VGAM286 RNA, herein designated VGAM RNA, also designated SEQ ID:2997.

[15946] Another function of VGAM286 is therefore inhibition of JJAZ1 (Accession NM_015355), a gene which is a zinc fin-

ger protein. Accordingly, utilities of VGAM286 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JJAZ1. The function of JJAZ1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM231.KIAA1223 (Accession XM_048747) is another VGAM286 host target gene. KIAA1223 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1223, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1223 BINDING SITE, designated SEQ ID:35243, to the nucleotide sequence of VGAM286 RNA, herein designated VGAM RNA, also designated SEQ ID:2997.

[15947] Another function of VGAM286 is therefore inhibition of KIAA1223 (Accession XM_048747). Accordingly, utilities of VGAM286 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1223. MGC4655 (Accession NM_033309) is another VGAM286 host target gene. MGC4655 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by MGC4655, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4655 BINDING SITE, designated SEQ ID:27144, to the nucleotide sequence of VGAM286 RNA, herein designated VGAM RNA, also designated SEQ ID:2997.

[15948] Another function of VGAM286 is therefore inhibition of MGC4655 (Accession NM_033309). Accordingly, utilities of VGAM286 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4655. R32184_3 (Accession NM_033420) is another VGAM286 host target gene. R32184_3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by R32184_3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of R32184_3 BINDING SITE, designated SEQ ID:27247, to the nucleotide sequence of VGAM286 RNA, herein designated VGAM RNA, also designated SEQ ID:2997.

[15949] Another function of VGAM286 is therefore inhibition of R32184_3 (Accession NM_033420). Accordingly, utilities

of VGAM286 include diagnosis, prevention and treatment of diseases and clinical conditions associated with R32184_3. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 287 (VGAM287) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15950] VGAM287 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM287 was detected is described hereinabove with reference to Figs. 1–8.

[15951] VGAM287 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM287 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15952] VGAM287 gene encodes a VGAM287 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM287 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM287 precursor RNA is designated SEQ ID:273, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:273 is located at position 89234 relative to the genome of Epi-phyas Postvittana Nucleopolyhedrovirus.

[15953] VGAM287 precursor RNA folds onto itself, forming VGAM287 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15954] An enzyme complex designated DICER COMPLEX, `dices` the VGAM287 folded precursor RNA into VGAM287 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM287 RNA is designated SEQ ID:2998, and

is provided hereinbelow with reference to the sequence listing part.

[15955] VGAM287 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM287 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM287 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15956] VGAM287 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM287 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM287 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM287 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM287 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[15957] The complementary binding of VGAM287 RNA, herein designated VGAM RNA, to host target binding sites on VGAM287 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM287 host target RNA into VGAM287 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15958] It is appreciated that VGAM287 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM287 host target genes. The mRNA of each one of this plurality of VGAM287 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM287 RNA, herein designated VGAM RNA, and which when bound by VGAM287 RNA causes inhibition of translation of respective one or more VGAM287 host target proteins.

[15959] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM287 gene, herein designated VGAM GENE, on one or more VGAM287 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15960] It is yet further appreciated that a function of VGAM287 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM287 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM287 correlate with, and may be deduced from, the identity of the host target genes which VGAM287 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15961] Nucleotide sequences of the VGAM287 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM287 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM287 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM287 are further described hereinbelow with reference to Table 1.

[15962] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM287 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM287 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15963] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM287 gene, herein designated VGAM is inhibition of expression of VGAM287 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM287 correlate with, and may be deduced from, the identity of the target genes which VGAM287 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15964] Amylo-1, 6-glucosidase, 4-alpha-glucanotransferase (glycogen debranching enzyme, glycogen storage disease type III) (AGL, Accession NM_000028) is a VGAM287 host target gene. AGL BINDING SITE1 through AGL BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AGL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGL BINDING SITE1 through AGL BINDING SITE6, designated SEQ ID:5467, SEQ ID:6284, SEQ ID:6289, SEQ ID:6294, SEQ ID:6299 and SEQ ID:6306 respectively, to the nucleotide sequence of VGAM287 RNA, herein designated VGAM RNA, also designated SEQ ID:2998.

[15965] A function of VGAM287 is therefore inhibition of Amylo-1, 6-glucosidase, 4-alpha-glucanotransferase (glycogen de-

branching enzyme, glycogen storage disease type III) (AGL, Accession NM_000028). Accordingly, utilities of VGAM287 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGL. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 288 (VGAM288) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[15966] VGAM288 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM288 was detected is described hereinabove with reference to Figs. 1–8.

[15967] VGAM288 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM288 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[15968] VGAM288 gene encodes a VGAM288 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM288 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM288 precursor RNA is designated SEQ ID:274, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:274 is located at position 54105 relative to the genome of Epi-phyas Postvittana Nucleopolyhedrovirus.

[15969] VGAM288 precursor RNA folds onto itself, forming VGAM288 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[15970] An enzyme complex designated DICER COMPLEX, `dices` the VGAM288 folded precursor RNA into VGAM288 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide se-

quence of VGAM288 RNA is designated SEQ ID:2999, and is provided hereinbelow with reference to the sequence listing part.

[15971] VGAM288 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM288 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM288 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[15972] VGAM288 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM288 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM288 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM288 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM288 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[15973] The complementary binding of VGAM288 RNA, herein designated VGAM RNA, to host target binding sites on VGAM288 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM288 host target RNA into VGAM288 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[15974] It is appreciated that VGAM288 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM288 host target genes. The mRNA of each one of this plurality of VGAM288 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM288 RNA, herein designated VGAM RNA, and which when bound by VGAM288 RNA causes inhibition of translation of respective one or more VGAM288 host target proteins.

[15975] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM288 gene, herein designated VGAM GENE, on one or more VGAM288 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[15976] It is yet further appreciated that a function of VGAM288 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM288 correlate with, and may be deduced from, the identity of the host target genes which VGAM288 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[15977] Nucleotide sequences of the VGAM288 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM288 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM288 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM288 are further described hereinbelow with reference to Table 1.

[15978] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM288 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM288 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[15979] As mentioned hereinabove with reference to Fig. 1, a function of VGAM288 gene, herein designated VGAM is inhibition of expression of VGAM288 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM288 correlate with, and may be deduced from, the identity of the target genes which VGAM288 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[15980] IL2-inducible T-cell Kinase (ITK, Accession NM_005546) is a VGAM288 host target gene. ITK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITK BINDING SITE, designated SEQ ID:12076, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[15981] A function of VGAM288 is therefore inhibition of IL2-inducible T-cell Kinase (ITK, Accession NM_005546), a gene which plays a role in t cell proliferation and differentiation. Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with ITK. The function of ITK has been established by previous studies. Signal transduction through the T-cell receptor (TCR; OMIM Ref. No. 186880) and cytokine receptors on the surface of T lymphocytes occurs largely via tyrosine phosphorylation of intracellular substrates. Signal transduction is thought to occur via association of these receptors with intracellular protein tyrosine kinases. To identify unique T-cell tyrosine kinases, Gibson et al. (1993) used PCR-based cloning with degenerate oligonucleotides directed at highly conserved motifs of tyrosine kinase domains. In this way, they cloned the complete cDNA for a unique human tyrosine kinase that is expressed mainly in T lymphocytes and natural killer (NK) cells. The cDNA predicted an open reading frame of 1,866 bp encoding a protein with a predicted size of 72 kD, which was in keeping with its size on Western blotting. A single 6.2-kb mRNA and 72-kD protein were detected in T lymphocytes and NK-like cell lines, but were not detected in other cell lineages. Sequence comparisons suggested that the protein is probably the human homolog of a murine interleukin-2-inducible T-cell kinase (ITK). However, unlike ITK, the message and protein levels for the new entity did not vary markedly on stimulation of human

IL-2 responsive T cells with IL-2. They referred to the gene and its protein product as EMT ('expressed mainly in T cells'). They concluded that EMT is a member of a new family of intracellular kinases that includes BPK (the kinase mutant in X-linked agammaglobulinemia, 300300). The expression of EMT message and protein in thymocytes and mature T cells, combined with its homology to BPK and its chromosomal localization, suggested that EMT may play a role in thymic ontogeny and growth regulation of mature T cells. Integrin adhesion receptors mediate critical interactions of T cells with other cells and extracellular matrix components during trafficking, as well as during antigen-specific recognition events in tissue. Phosphatidylinositol 3-kinase (PI3K; OMIM Ref. No. 601232) has a role in the regulation of integrin activity by CD3 (see OMIM Ref. No. 186790)-TCR and in the regulation of ITK. Woods et al. (2001) determined that TCR-mediated activation of beta-1 integrins (see OMIM Ref. No. ITGB1; 135630) requires activation of ITK and PI3K-dependent recruitment of ITK to detergent-insoluble glycosphingolipid-enriched microdomains (DIGs) via binding of the pleckstrin homology domain of ITK to the PI3K product PI(3,4,5)-P3. Likewise, activation of PI3K and

LCK (OMIM Ref. No. 153390) via CD4 (OMIM Ref. No. 186940) coreceptor stimulation can initiate beta-1 integrin activation dependent on ITK function. CD4 stimulation, together with targeting of ITK to DIGs, also activates TCR-independent beta-1 integrin function. Changes in beta-1 integrin function mediated by TCR-induced activation of ITK are accompanied by ITK-dependent modulation of the actin cytoskeleton. Woods et al. (2001) concluded that TCR-mediated activation of beta-1 integrin involves membrane relocalization and activation of ITK via coordinate action of PI3K and an SRC family tyrosine kinase. Animal model experiments lend further support to the function of ITK. By homologous recombination, Schaeffer et al. (1999) disrupted the Rlk (TXK; 600058) gene in mice. Heterozygotes were completely normal. Homozygous null Rlk mice showed increased amounts of Itk mRNA. The authors hypothesized that upregulation of related Tec kinases may partially compensate for the lack of Rlk. Schaeffer et al. (1999) therefore generated Rlk $-/-$ Itk $-/-$ mice by interbreeding. Itk-deficient mice have reduced numbers of mature T cells, particularly CD4⁺ cells, causing a decreased CD4-to-CD8 ratio. Rlk $-/-$ Itk $-/-$ mutants, however, had normal T cell numbers. Both CD4⁺

and CD8⁺ cell numbers are increased relative to Itk ^{-/-} mice. The persistent abnormal ratio of CD4⁺ to CD8⁺ cells suggested an altered regulation of lymphoid development and homeostasis in the double mutants. The double mutants had marked defects in T-cell receptor responses including proliferation, cytokine production, and apoptosis in vitro and adaptive immune responses to *Toxoplasma gondii* in vivo. Molecular events immediately downstream from the T-cell receptor were intact in Rlk ^{-/-} Itk ^{-/-} cells, but intermediate events including inositol trisphosphate production, calcium mobilization, and mitogen-activated protein kinase activation were impaired, establishing Tec kinases as critical regulators of T-cell receptor signaling required for phospholipase C-γ activation.

[15982] It is appreciated that the abovementioned animal model for ITK is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[15983] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15984] Schaeffer, E. M.; Debnath, J.; Yap, G.; McVicar, D.; Liao, X.

C.; Littman, D. R.; Sher, A.; Varmus, H. E.; Lenardo, M. J.; Schwartzberg, P. L. : Requirement for Tec kinases Rlk and Itk in T cell receptor signaling and immunity. Science 284: 638–641, 1999. ; and

[15985] Woods, M. L.; Kivens, W. J.; Adelsman, M. A.; Qiu, Y.; August, A.; Shimizu, Y. : A novel function for the Tec family tyrosine kinase Itk in activation of beta-1 integrins by the T-cell.

[15986] Further studies establishing the function and utilities of ITK are found in John Hopkins OMIM database record ID 186973, and in cited publications numbered 1133–1137 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Melatonin Receptor 1A (MTNR1A, Accession NM_005958) is another VGAM288 host target gene. MTNR1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTNR1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTNR1A BINDING SITE, designated SEQ ID:12582, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[15987] Another function of VGAM288 is therefore inhibition of Melatonin Receptor 1A (MTNR1A, Accession NM_005958), a gene which likely mediates the reproductive and circadian actions of melatonin. Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTNR1A. The function of MTNR1A has been established by previous studies. Reppert and Weaver (1995) reviewed the hormonal properties of melatonin and the characteristics of the melatonin receptors. Brzezinski (1997) likewise gave a comprehensive review of the function of melatonin and its clinical implications. Sleep disruption, nightly restlessness, sundowning, and other circadian disturbances are frequently seen in Alzheimer disease (AD; 104300) patients. Since melatonin is the main endocrine message for circadian rhythmicity from the pineal, Liu et al. (1999) studied melatonin levels in the cerebrospinal fluid (CSF) of 85 AD patients and 82 age-matched controls. In old control subjects (older than 80 years of age), CSF melatonin levels were half those of control subjects 41 to 80 years of age. In AD patients the CSF melatonin levels were only one-fifth of those in control subjects. The authors did not find a diurnal rhythm in CSF melatonin levels in control

subjects or AD patients Von Gall et al. (2002) demonstrated that cycling expression of the clock gene Period-1 (OMIM Ref. No. 602260) in rodent pituitary cells depends on the heterologous sensitization of the adenosine A2B receptor (OMIM Ref. No. 600446), which occurs through the nocturnal activation of melatonin mt1 receptors. Eliminating the impact of the neurohormone melatonin simultaneously suppresses the expression of Period-1 and evokes an increase in the release of pituitary prolactin. Von Gall et al. (2002) concluded that their observations expose a mechanism by which 2 convergent signals interact within a temporal dimension to establish high-amplitude, precise, and robust cycles of gene expression.

[15988] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[15989] von Gall, C.; Garabette, M. L.; Kell, C. A.; Frenzel, S.; Dehghani, F.; Schumm-Draeger, P.-M.; Weaver, D. R.; Korf, H.-W.; Hastings, M. H.; Stehle, J. H. : Rhythmic gene expression in pituitary depends on heterologous sensitization by the neurohormone melatonin. *Nature Neurosci.* 5: 234-238, 2002. ; and

Localization of melatonin receptors in mammalian brain.In: Klein, D. C.; Moore, R. Y.; Reppert, S. M. : Suprachiasmatic.

[15991] Further studies establishing the function and utilities of MTNR1A are found in John Hopkins OMIM database record ID 600665, and in cited publications numbered 8179–8183, 812 and 10227 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.Oligophrenin 1 (OPHN1, Accession NM_002547) is another VGAM288 host target gene. OPHN1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by OPHN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPHN1 BINDING SITE, designated SEQ ID:8405, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[15992] Another function of VGAM288 is therefore inhibition of Oligophrenin 1 (OPHN1, Accession NM_002547). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with OPHN1. Recombination Activating Gene 1 (RAG1, Accession NM_000448) is another VGAM288 host target gene. RAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAG1 BINDING SITE, designated SEQ ID:6040, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[15993] Another function of VGAM288 is therefore inhibition of Recombination Activating Gene 1 (RAG1, Accession NM_000448). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAG1. Solute Carrier Family 18 (vesicular acetylcholine), Member 3 (SLC18A3, Accession NM_003055) is another VGAM288 host target gene. SLC18A3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC18A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of SLC18A3 BINDING SITE, designated SEQ ID:9019, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[15994] Another function of VGAM288 is therefore inhibition of Solute Carrier Family 18 (vesicular acetylcholine), Member 3 (SLC18A3, Accession NM_003055). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC18A3. Aquaporin 10 (AQP10, Accession NM_080429) is another VGAM288 host target gene. AQP10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AQP10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AQP10 BINDING SITE, designated SEQ ID:27840, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[15995] Another function of VGAM288 is therefore inhibition of Aquaporin 10 (AQP10, Accession NM_080429). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with AQP10. BTB (POZ) Domain Containing 3 (BTBD3, Accession NM_014962) is another VGAM288 host target gene. BTBD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BTBD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTBD3 BINDING SITE, designated SEQ ID:17341, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[15996] Another function of VGAM288 is therefore inhibition of BTB (POZ) Domain Containing 3 (BTBD3, Accession NM_014962). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTBD3. DRCTNNB1A (Accession NM_032581) is another VGAM288 host target gene. DRCTNNB1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DRCTNNB1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DRCTNNB1A BINDING SITE, des-

ignated SEQ ID:26316, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[15997] Another function of VGAM288 is therefore inhibition of DRCTNNB1A (Accession NM_032581). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRCTNNB1A. FLJ10700 (Accession NM_018182) is another VGAM288 host target gene. FLJ10700 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10700 BINDING SITE, designated SEQ ID:20021, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[15998] Another function of VGAM288 is therefore inhibition of FLJ10700 (Accession NM_018182). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10700. FLJ23053 (Accession NM_022907) is another VGAM288 host target gene. FLJ23053 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ23053, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23053 BINDING SITE, designated SEQ ID:23207, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[15999] Another function of VGAM288 is therefore inhibition of FLJ23053 (Accession NM_022907). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23053. FLJ30663 (Accession XM_086046) is another VGAM288 host target gene. FLJ30663 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ30663, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30663 BINDING SITE, designated SEQ ID:38462, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[16000] Another function of VGAM288 is therefore inhibition of

FLJ30663 (Accession XM_086046). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30663. Glycoprotein V (platelet) (GP5, Accession NM_004488) is another VGAM288 host target gene. GP5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GP5 BINDING SITE, designated SEQ ID:10818, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[16001] Another function of VGAM288 is therefore inhibition of Glycoprotein V (platelet) (GP5, Accession NM_004488). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GP5. Hairy/enhancer-of-split Related with YRPW Motif-like (HEYL, Accession NM_014571) is another VGAM288 host target gene. HEYL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HEYL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEYL BINDING SITE, designated SEQ ID:15931, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[16002] Another function of VGAM288 is therefore inhibition of Hairy/enhancer-of-split Related with YRPW Motif-like (HEYL, Accession NM_014571). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEYL. KIAA0254 (Accession NM_014758) is another VGAM288 host target gene. KIAA0254 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0254, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0254 BINDING SITE, designated SEQ ID:16507, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[16003] Another function of VGAM288 is therefore inhibition of KIAA0254 (Accession NM_014758). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0254. KIAA0447 (Accession XM_049733) is another VGAM288 host target gene. KIAA0447 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0447, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0447 BINDING SITE, designated SEQ ID:35495, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[16004] Another function of VGAM288 is therefore inhibition of KIAA0447 (Accession XM_049733). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0447. KIAA0547 (Accession NM_014793) is another VGAM288 host target gene. KIAA0547 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0547, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0547 BINDING SITE, designated SEQ ID:16696, to the

nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[16005] Another function of VGAM288 is therefore inhibition of KIAA0547 (Accession NM_014793). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0547. KIAA0892 (Accession XM_048457) is another VGAM288 host target gene. KIAA0892 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0892, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0892 BINDING SITE, designated SEQ ID:35171, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[16006] Another function of VGAM288 is therefore inhibition of KIAA0892 (Accession XM_048457). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0892. KIAA1223 (Accession XM_048747) is another VGAM288 host target gene. KIAA1223 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1223, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1223 BINDING SITE, designated SEQ ID:35249, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[16007] Another function of VGAM288 is therefore inhibition of KIAA1223 (Accession XM_048747). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1223. KIAA1354 (Accession XM_027604) is another VGAM288 host target gene. KIAA1354 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1354, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1354 BINDING SITE, designated SEQ ID:30540, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[16008] Another function of VGAM288 is therefore inhibition of KIAA1354 (Accession XM_027604). Accordingly, utilities

of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1354. MGC14859 (Accession XM_030295) is another VGAM288 host target gene. MGC14859 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC14859, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14859 BINDING SITE, designated SEQ ID:31006, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[16009] Another function of VGAM288 is therefore inhibition of MGC14859 (Accession XM_030295). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14859. Purinergic Receptor P2X, Ligand-gated Ion Channel, 1 (P2RX1, Accession XM_040635) is another VGAM288 host target gene. P2RX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P2RX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of P2RX1 BINDING SITE, designated SEQ ID:33358, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[16010] Another function of VGAM288 is therefore inhibition of Purinergic Receptor P2X, Ligand-gated Ion Channel, 1 (P2RX1, Accession XM_040635). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RX1. Septin 3 (SEPT3, Accession NM_019106) is another VGAM288 host target gene. SEPT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEPT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEPT3 BINDING SITE, designated SEQ ID:21184, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[16011] Another function of VGAM288 is therefore inhibition of Septin 3 (SEPT3, Accession NM_019106). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with SEPT3. LOC150095 (Accession XM_097805) is another VGAM288 host target gene. LOC150095 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150095, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150095 BINDING SITE, designated SEQ ID:41131, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[16012] Another function of VGAM288 is therefore inhibition of LOC150095 (Accession XM_097805). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150095. LOC163915 (Accession XM_099567) is another VGAM288 host target gene. LOC163915 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163915, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163915 BINDING SITE, designated SEQ ID:42100, to the nucleotide sequence of VGAM288 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2999.

[16013] Another function of VGAM288 is therefore inhibition of LOC163915 (Accession XM_099567). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163915. LOC165568 (Accession XM_092674) is another VGAM288 host target gene. LOC165568 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC165568, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165568 BINDING SITE, designated SEQ ID:40138, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[16014] Another function of VGAM288 is therefore inhibition of LOC165568 (Accession XM_092674). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165568. LOC197285 (Accession XM_113752) is another VGAM288 host target gene. LOC197285 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197285, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197285 BINDING SITE, designated SEQ ID:42413, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[16015] Another function of VGAM288 is therefore inhibition of LOC197285 (Accession XM_113752). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197285. LOC256997 (Accession XM_170900) is another VGAM288 host target gene. LOC256997 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256997, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256997 BINDING SITE, designated SEQ ID:45653, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:2999.

[16016] Another function of VGAM288 is therefore inhibition of LOC256997 (Accession XM_170900). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC256997. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 289 (VGAM289) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16017] VGAM289 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM289 was detected is described hereinabove with reference to Figs. 1–8.

[16018] VGAM289 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM289 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16019] VGAM289 gene encodes a VGAM289 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM289 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM289 precursor RNA is designated SEQ

ID:275, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:275 is located at position 113982 relative to the genome of Epi-phyas Postvittana Nucleopolyhedrovirus.

[16020] VGAM289 precursor RNA folds onto itself, forming VGAM289 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16021] An enzyme complex designated DICER COMPLEX, `dices` the VGAM289 folded precursor RNA into VGAM289 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM289 RNA is designated SEQ ID:3000, and is provided hereinbelow with reference to the sequence

listing part.

[16022] VGAM289 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM289 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM289 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[16023] VGAM289 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM289 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM289 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM289 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM289 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16024] The complementary binding of VGAM289 RNA, herein designated VGAM RNA, to host target binding sites on VGAM289 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM289 host target RNA into VGAM289 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16025] It is appreciated that VGAM289 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM289 host target genes. The mRNA of each one of this plurality of VGAM289 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM289 RNA, herein designated VGAM

RNA, and which when bound by VGAM289 RNA causes inhibition of translation of respective one or more VGAM289 host target proteins.

[16026] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM289 gene, herein designated VGAM GENE, on one or more VGAM289 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16027] It is yet further appreciated that a function of VGAM289 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM289 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM289 correlate with, and may be deduced from, the identity of the host target genes which VGAM289 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16028] Nucleotide sequences of the VGAM289 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM289 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM289 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM289 are further described hereinbelow with reference to Table 1.

[16029] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM289 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM289 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16030] As mentioned hereinabove with reference to Fig. 1, a function of VGAM289 gene, herein designated VGAM is

inhibition of expression of VGAM289 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM289 correlate with, and may be deduced from, the identity of the target genes which VGAM289 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16031] Chromosome X Open Reading Frame 6 (CXorf6, Accession NM_005491) is a VGAM289 host target gene. CXorf6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CXorf6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXorf6 BINDING SITE, designated SEQ ID:11989, to the nucleotide sequence of VGAM289 RNA, herein designated VGAM RNA, also designated SEQ ID:3000.

[16032] A function of VGAM289 is therefore inhibition of Chromosome X Open Reading Frame 6 (CXorf6, Accession NM_005491). Accordingly, utilities of VGAM289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXorf6. Heterogeneous Nuclear Ribonucleoprotein D-like (HNRPDL, Accession NM_005463) is another VGAM289 host target gene. HNR-

PDL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HNRPDL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPDL BINDING SITE, designated SEQ ID:11948, to the nucleotide sequence of VGAM289 RNA, herein designated VGAM RNA, also designated SEQ ID:3000.

[16033] Another function of VGAM289 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein D-like (HNRPDL, Accession NM_005463), a gene which binds to rna molecules that contain au-rich elements. Accordingly, utilities of VGAM289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPDL. The function of HNRPDL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM144. Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 3 Regulatory Factor 1 (SLC9A3R1, Accession XM_046932) is another VGAM289 host target gene. SLC9A3R1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by SLC9A3R1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC9A3R1 BINDING SITE, designated SEQ ID:34864, to the nucleotide sequence of VGAM289 RNA, herein designated VGAM RNA, also designated SEQ ID:3000.

[16034] Another function of VGAM289 is therefore inhibition of Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 3 Regulatory Factor 1 (SLC9A3R1, Accession XM_046932), a gene which is the regulatory cofactor of the NHE3 (SLC9A3) sodium/hydrogen antiporter. Accordingly, utilities of VGAM289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC9A3R1. The function of SLC9A3R1 has been established by previous studies. Murthy et al. (1998) isolated SLC9A3R1, which they termed NHERF, by screening a fetal frontal cortex cDNA library using a yeast 2-hybrid system with merlin as bait. Northern blot analysis revealed that SLC9A3R1 is ubiquitously expressed, with highest levels in kidney, liver, and pancreas. Deletion and mutation analyses showed that SLC9A3R1 associates with the N terminus but not with the C terminus of merlin. SLC9A3R1

was also shown to bind to moesin and radixin at the N terminus, the region with the most homology to merlin. Using immunocytochemistry, Murthy et al. (1998) demonstrated that SLC9A3R1 colocalizes with moesin at the ruffling membrane, microvilli, and filopodia in HeLa cells. Animal model experiments lend further support to the function of SLC9A3R1. Shenolikar et al. (2002) found that targeted disruption of the mouse *Nherf1* gene eliminated *Nherf1* expression in kidney and other tissues of the mutant mice without altering *Nherf2* levels in these tissues. Heterozygous and homozygous deficient male mice maintained normal blood electrolytes but showed increased urinary excretion of phosphate when compared with homozygous wildtype animals. Although the overall levels of renal *Nherf1* targets, *Slc9a3* and sodium-phosphate transport-2 (*Npt2*; 182309), were unchanged in the mutant mice, immunocytochemistry showed that the *Npt2* protein was aberrantly localized at internal sites in the renal proximal tubule cells. The mislocalization of *Npt2* paralleled a reduction in the transporter protein in renal brush-border membranes isolated from the mutant mice. In contrast, *Slc9a3* was appropriately localized at the apical surface of proximal tubules in both wildtype and mu-

tant mice. These data suggested that NHERF1 plays a unique role in the apical targeting and/or trafficking of NPT2 in the mammalian kidney, a function not shared by NHERF2 or other renal PDZ proteins. Phosphate wasting seen in the Nherf1 homozygous null mice provided a novel experimental system for defining the role of PDZ adaptors in the hormonal control of ion transport and renal disease

[16035] It is appreciated that the abovementioned animal model for SLC9A3R1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[16036] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16037] Shenolikar, S.; Voltz, J. W.; Minkoff, C. M.; Wade, J. B.; Weinman, E. J. : Targeted disruption of the mouse NHERF-1 gene promotes internalization of proximal tubule sodium-phosphate cotransporter type IIa and renal phosphate wasting. Proc. Nat. Acad. Sci. 99: 11470-11475, 2002. ; and

[16038] Murthy, A.; Gonzalez-Agosti, C.; Cordero, E.; Pinney, D.; Candia, C.; Solomon, F.; Gusella, J.; Ramesh, V. : NHE-RF,

a regulatory cofactor for Na(+)-H(+) exchange, is a common interactor f.

[16039] Further studies establishing the function and utilities of SLC9A3R1 are found in John Hopkins OMIM database record ID 604990, and in cited publications numbered 434 and 7098-7100 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 36, C3H Type-like 1 (ZFP36L1, Accession NM_004926) is another VGAM289 host target gene. ZFP36L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZFP36L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP36L1 BINDING SITE, designated SEQ ID:11361, to the nucleotide sequence of VGAM289 RNA, herein designated VGAM RNA, also designated SEQ ID:3000.

[16040] Another function of VGAM289 is therefore inhibition of Zinc Finger Protein 36, C3H Type-like 1 (ZFP36L1, Accession NM_004926), a gene which is a regulatory protein involved in regulating the response to growth factors. Accordingly, utilities of VGAM289 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with ZFP36L1. The function of ZFP36L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. ARHGAP10 (Accession NM_020824) is another VGAM289 host target gene. ARHGAP10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGAP10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP10 BINDING SITE, designated SEQ ID:21888, to the nucleotide sequence of VGAM289 RNA, herein designated VGAM RNA, also designated SEQ ID:3000.

[16041] Another function of VGAM289 is therefore inhibition of ARHGAP10 (Accession NM_020824). Accordingly, utilities of VGAM289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP10. GBTS1 (Accession NM_145173) is another VGAM289 host target gene. GBTS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GBTS1, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GBTS1 BINDING SITE, designated SEQ ID:29724, to the nucleotide sequence of VGAM289 RNA, herein designated VGAM RNA, also designated SEQ ID:3000.

[16042] Another function of VGAM289 is therefore inhibition of GBTS1 (Accession NM_145173). Accordingly, utilities of VGAM289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GBTS1. KIAA0547 (Accession NM_014793) is another VGAM289 host target gene. KIAA0547 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0547, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0547 BINDING SITE, designated SEQ ID:16694, to the nucleotide sequence of VGAM289 RNA, herein designated VGAM RNA, also designated SEQ ID:3000.

[16043] Another function of VGAM289 is therefore inhibition of KIAA0547 (Accession NM_014793). Accordingly, utilities of VGAM289 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0547. MEGF10 (Accession NM_032446) is another VGAM289 host target gene. MEGF10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEGF10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEGF10 BINDING SITE, designated SEQ ID:26207, to the nucleotide sequence of VGAM289 RNA, herein designated VGAM RNA, also designated SEQ ID:3000.

[16044] Another function of VGAM289 is therefore inhibition of MEGF10 (Accession NM_032446). Accordingly, utilities of VGAM289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEGF10. LOC146455 (Accession XM_085471) is another VGAM289 host target gene. LOC146455 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146455, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146455 BINDING SITE, designated SEQ ID:38154, to the nucleotide se-

quence of VGAM289 RNA, herein designated VGAM RNA, also designated SEQ ID:3000.

[16045] Another function of VGAM289 is therefore inhibition of LOC146455 (Accession XM_085471). Accordingly, utilities of VGAM289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146455. LOC204084 (Accession XM_115181) is another VGAM289 host target gene. LOC204084 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC204084, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204084 BINDING SITE, designated SEQ ID:43085, to the nucleotide sequence of VGAM289 RNA, herein designated VGAM RNA, also designated SEQ ID:3000.

[16046] Another function of VGAM289 is therefore inhibition of LOC204084 (Accession XM_115181). Accordingly, utilities of VGAM289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204084. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 290 (VGAM290) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16047] VGAM290 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM290 was detected is described hereinabove with reference to Figs. 1–8.

[16048] VGAM290 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM290 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16049] VGAM290 gene encodes a VGAM290 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM290 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM290 precursor RNA is designated SEQ ID:276, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:276 is located at position 108012 relative to the genome of Epiphyas Postvittana Nucleopolyhedrovirus.

[16050] VGAM290 precursor RNA folds onto itself, forming VGAM290 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16051] An enzyme complex designated DICER COMPLEX, `dices` the VGAM290 folded precursor RNA into VGAM290 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM290 RNA is designated SEQ ID:3001, and is provided hereinbelow with reference to the sequence listing part.

[16052] VGAM290 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM290 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM290 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[16053] VGAM290 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM290 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM290 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM290 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM290 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16054] The complementary binding of VGAM290 RNA, herein designated VGAM RNA, to host target binding sites on VGAM290 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM290 host target RNA into VGAM290 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16055] It is appreciated that VGAM290 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM290 host target genes. The mRNA of each one of this plurality of VGAM290 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM290 RNA, herein designated VGAM RNA, and which when bound by VGAM290 RNA causes inhibition of translation of respective one or more VGAM290 host target proteins.

[16056] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM290 gene, herein designated VGAM GENE, on one or more VGAM290 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16057] It is yet further appreciated that a function of VGAM290 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM290 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM290 correlate with, and may be deduced

from, the identity of the host target genes which VGAM290 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16058] Nucleotide sequences of the VGAM290 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM290 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM290 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM290 are further described hereinbelow with reference to Table 1.

[16059] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM290 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM290 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16060] As mentioned hereinabove with reference to Fig. 1, a function of VGAM290 gene, herein designated VGAM is inhibition of expression of VGAM290 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM290 correlate with, and may be deduced from, the identity of the target genes which VGAM290

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16061] Radixin (RDX, Accession NM_002906) is a VGAM290 host target gene. RDX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RDX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RDX BINDING SITE, designated SEQ ID:8808, to the nucleotide sequence of VGAM290 RNA, herein designated VGAM RNA, also designated SEQ ID:3001.

[16062] A function of VGAM290 is therefore inhibition of Radixin (RDX, Accession NM_002906), a gene which plays a crucial role in the binding of the barbed end of actin filaments to the plasma membrane. Accordingly, utilities of VGAM290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RDX. The function of RDX has been established by previous studies. Radixin is a cytoskeletal protein that may be important in linking actin to the plasma membrane. Cloning of the murine and porcine radixin cDNAs demonstrated a protein highly homologous to ezrin (OMIM Ref. No. 123900) and moesin (OMIM Ref. No. 309845). Wilgenbus et al. (1993) cloned

and sequenced the human radixin cDNA and found the predicted amino acid sequence for the human protein to be nearly identical to those predicted for radixin in the two other species. Animal model experiments lend further support to the function of RDX. The ezrin–radixin–moesin (ERM) family of proteins crosslink actin filaments and integral membrane proteins. Radixin (encoded by Rdx) is the dominant ERM protein in the liver of wildtype mice and is concentrated at bile canalicular membranes (BCM).

Kikuchi et al. (2002) showed that Rdx $-/-$ mice are normal at birth, but their serum concentrations of conjugated bilirubin begin to increase gradually around 4 weeks of age, and they show mild liver injury after 8 weeks. This phenotype is similar to human conjugated hyperbilirubinemia in Dubin–Johnson syndrome (OMIM Ref. No. 237500), which is caused by mutations in the ABCC2 gene (OMIM Ref. No. 601107), although Dubin–Johnson syndrome is not associated with overt liver injury. In wildtype mice, the protein product of the ABCC2 gene, multidrug resistance protein–2, or MRP2, concentrates at BCMs to secrete conjugated bilirubin into bile. In the BCMs of Rdx $-/-$ mice, Mrp2 is decreased compared with other BCM proteins such as dipeptidyl peptidase IV (CD26; 102720)

and P-glycoproteins. In vitro binding studies showed that radixin associates directly with the carboxy-terminal cytoplasmic domain of human MRP2. These findings indicated that radixin is required for secretion of conjugated bilirubin through its support of Mrp2 localization at BCMs.

[16063] It is appreciated that the abovementioned animal model for RDX is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[16064] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16065] Wilgenbus, K. K.; Milatovich, A.; Francke, U.; Furthmayr, H. : Molecular cloning, cDNA sequence, and chromosomal assignment of the human radixin gene and two dispersed pseudogenes. *Genomics* 16: 199–206, 1993. ; and

[16066] Kikuchi, S.; Hata, M.; Fukumoto, K.; Yamane, Y.; Matsui, T.; Tamura, A.; Yonemura, S.; Yamagishi, H.; Keppler, D.; Tsukita, S.; Tsukita, S. : Radixin deficiency causes conjugated hyperbi.

[16067] Further studies establishing the function and utilities of RDX are found in John Hopkins OMIM database record ID 179410, and in cited publications numbered 2716–2717

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Kell Blood Group Precursor (McLeod phenotype) (XK, Accession NM_021083) is another VGAM290 host target gene. XK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XK BINDING SITE, designated SEQ ID:22062, to the nucleotide sequence of VGAM290 RNA, herein designated VGAM RNA, also designated SEQ ID:3001.

[16068] Another function of VGAM290 is therefore inhibition of Kell Blood Group Precursor (McLeod phenotype) (XK, Accession NM_021083). Accordingly, utilities of VGAM290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XK. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 291 (VGAM291) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16069] VGAM291 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM291 was detected is described hereinabove with reference to Figs. 1–8.

[16070] VGAM291 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM291 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16071] VGAM291 gene encodes a VGAM291 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM291 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM291 precursor RNA is designated SEQ ID:277, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:277 is located at position 95193 relative to the genome of Epiphyas Postvittana Nucleopolyhedrovirus.

[16072] VGAM291 precursor RNA folds onto itself, forming VGAM291 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16073] An enzyme complex designated DICER COMPLEX, `dices` the VGAM291 folded precursor RNA into VGAM291 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM291 RNA is designated SEQ ID:3002, and is provided hereinbelow with reference to the sequence listing part.

[16074] VGAM291 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM291 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM291 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[16075] VGAM291 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM291 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM291 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM291 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM291 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16076] The complementary binding of VGAM291 RNA, herein designated VGAM RNA, to host target binding sites on VGAM291 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM291 host target RNA into VGAM291 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16077] It is appreciated that VGAM291 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM291 host target genes. The mRNA of each one of this plurality of VGAM291 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM291 RNA, herein designated VGAM RNA, and which when bound by VGAM291 RNA causes inhibition of translation of respective one or more VGAM291 host target proteins.

[16078] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM291 gene, herein designated VGAM GENE, on one or more VGAM291 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16079] It is yet further appreciated that a function of VGAM291 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM291 correlate with, and may be deduced from, the identity of the host target genes which VGAM291 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16080] Nucleotide sequences of the VGAM291 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM291 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM291 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM291 are further
described hereinbelow with reference to Table 1.

[16081] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM291 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM291 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[16082] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM291 gene, herein designated VGAM is
inhibition of expression of VGAM291 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM291 correlate with, and may be deduced
from, the identity of the target genes which VGAM291
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[16083] Angiopoietin 1 (ANGPT1, Accession NM_139290) is a
VGAM291 host target gene. ANGPT1 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ANGPT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANGPT1 BINDING SITE, designated SEQ ID:29289, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:3002.

[16084] A function of VGAM291 is therefore inhibition of Angiopoietin 1 (ANGPT1, Accession NM_139290), a gene which binds and activates tie2 receptor by inducing its tyrosine phosphorylation. Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANGPT1. The function of ANGPT1 has been established by previous studies. By FISH and radiation hybrid analysis, Cheung et al. (1998) mapped the ANGPT1 gene to 8q22.3-q23. By FISH, Valenzuela et al. (1999) mapped the ANGPT1 gene to 8q22 in a region that shows homology of synteny to mouse chromosome 15, where they mapped the mouse Angpt1 gene. However, by indirect in situ PCR and FISH, Marziliano et al. (1999) mapped the Angpt1 gene in the mouse to chromosome 9E2. To explore the possibility that VEGF and an-

giopietins collaborate during tumor angiogenesis, Holash et al. (1999) analyzed several different murine and human tumor models. The apparent association of tumor vessel regression, apoptosis, and disruption of endothelial cell interactions with support cells in rat C6 gliomas raised the possibility that blockade of the stabilizing action of Ang1 might be contributing to tumor vessel regression. Consistent with this possibility, Holash et al. (1999) noted that angiopoietin-1 was antiapoptotic for cultured endothelial cells and expression of its antagonist angiopoietin-2 was induced in the endothelium of co-opted tumor vessels before their regression. Diffuse angiopoietin-1 expression in human tumors resembled that seen in the rat model. Holash et al. (1999) suggested that a subset of tumors rapidly co-opts existing host vessels to form an initially well vascularized tumor mass. Perhaps as part of a host defense mechanism there is widespread regression of these initially co-opted vessels, leading to a secondarily avascular tumor and a massive tumor cell loss. However, the remaining tumor is ultimately rescued by robust angiogenesis at the tumor margin. Animal model experiments lend further support to the function of ANGPT1. Suri et al. (1996) showed that mice engineered to lack an-

angiopoietin-1 display angiogenic defects reminiscent of those previously seen in mice lacking Tie2, demonstrating that angiopoietin-1 is a primary physiologic ligand for Tie2 and that it has critical in vivo angiogenic actions that are distinct from vascular endothelial growth factor (VEGF; 192240) and that are not reflected in the classic in vitro assays used to characterize VEGF. They concluded that angiopoietin-1 appears to play a crucial role in mediating reciprocal interactions between the endothelium and surrounding matrix and mesenchyme.

[16085] It is appreciated that the abovementioned animal model for ANGPT1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[16086] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16087] Holash, J.; Maisonpierre, P. C.; Compton, D.; Boland, P.; Alexander, C. R.; Zagzag, D.; Yancopoulos, G. D.; Wiegand, S. J. : Vessel cooption, regression, and growth in tumors mediated by angiopoietins and VEGF. Science 284: 1994-1998, 1999. ; and

[16088] Suri, C.; Jones, P. F.; Patan, S.; Bartunkova, S.; Maison-

pierre, P. C.; Davis, S.; Sato, T. N.; Yancopoulos, G. D. :
Requisite role of angiopoietin-1, a ligand for the TIE2 receptor, du.

[16089] Further studies establishing the function and utilities of ANGPT1 are found in John Hopkins OMIM database record ID 601667, and in cited publications numbered 9394-9396, 10441, 9397-9400, 1045 and 10205 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 2 (facilitated glucose transporter), Member 3 (SLC2A3, Accession NM_006931) is another VGAM291 host target gene. SLC2A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC2A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC2A3 BINDING SITE, designated SEQ ID:13815, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:3002.

[16090] Another function of VGAM291 is therefore inhibition of Solute Carrier Family 2 (facilitated glucose transporter), Member 3 (SLC2A3, Accession NM_006931), a gene which

probably is a neuronal glucose transporter. Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC2A3. The function of SLC2A3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247.FLJ13110 (Accession NM_022912) is another VGAM291 host target gene. FLJ13110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13110 BINDING SITE, designated SEQ ID:23219, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:3002.

[16091] Another function of VGAM291 is therefore inhibition of FLJ13110 (Accession NM_022912). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13110. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present inven-

tion, referred to here as Viral Genomic Address Messenger 292 (VGAM292) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16092] VGAM292 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM292 was detected is described hereinabove with reference to Figs. 1–8.

[16093] VGAM292 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM292 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16094] VGAM292 gene encodes a VGAM292 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM292 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM292 precursor RNA is designated SEQ ID:278, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:278 is located at position 9896 relative to the genome of Epiphyas Postvittana Nucleopolyhedrovirus.

[16095] VGAM292 precursor RNA folds onto itself, forming VGAM292 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16096] An enzyme complex designated DICER COMPLEX, `dices` the VGAM292 folded precursor RNA into VGAM292 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM292 RNA is designated SEQ ID:3003, and is provided hereinbelow with reference to the sequence listing part.

[16097] VGAM292 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM292 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM292 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[16098] VGAM292 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM292 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM292 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM292 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM292 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16099] The complementary binding of VGAM292 RNA, herein designated VGAM RNA, to host target binding sites on VGAM292 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM292 host target RNA into VGAM292 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16100] It is appreciated that VGAM292 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM292 host target genes. The mRNA of each one of this plurality of VGAM292 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM292 RNA, herein designated VGAM RNA, and which when bound by VGAM292 RNA causes inhibition of translation of respective one or more VGAM292 host target proteins.

[16101] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM292 gene, herein designated VGAM GENE, on one or more VGAM292 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16102] It is yet further appreciated that a function of VGAM292 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM292 correlate with, and may be deduced

from, the identity of the host target genes which VGAM292 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16103] Nucleotide sequences of the VGAM292 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM292 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM292 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM292 are further described hereinbelow with reference to Table 1.

[16104] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM292 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM292 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16105] As mentioned hereinabove with reference to Fig. 1, a function of VGAM292 gene, herein designated VGAM is inhibition of expression of VGAM292 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM292 correlate with, and may be deduced from, the identity of the target genes which VGAM292

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16106] Acidic Repeat Containing (ACRC, Accession NM_052957) is a VGAM292 host target gene. ACRC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACRC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACRC BINDING SITE, designated SEQ ID:27517, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:3003.

[16107] A function of VGAM292 is therefore inhibition of Acidic Repeat Containing (ACRC, Accession NM_052957). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACRC. Aldehyde Dehydrogenase 3 Family, Member A2 (ALDH3A2, Accession XM_045060) is another VGAM292 host target gene. ALDH3A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALDH3A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

complementarity of the nucleotide sequences of ALDH3A2 BINDING SITE, designated SEQ ID:34340, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:3003.

[16108] Another function of VGAM292 is therefore inhibition of Aldehyde Dehydrogenase 3 Family, Member A2 (ALDH3A2, Accession XM_045060). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH3A2. Forkhead Box F1 (FOXF1, Accession NM_001451) is another VGAM292 host target gene. FOXF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FOXF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXF1 BINDING SITE, designated SEQ ID:7183, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:3003.

[16109] Another function of VGAM292 is therefore inhibition of Forkhead Box F1 (FOXF1, Accession NM_001451), a gene which is a probable transcription activator for a number of lung-specific genes. Accordingly, utilities of VGAM292

include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXF1. The function of FOXF1 has been established by previous studies. The forkhead genes are transcription factors distinguished by a characteristic 100–amino acid motif that was originally identified in *Drosophila* (see OMIM Ref. No. 164874). Pierrou et al. (1994) identified 7 human genes containing forkhead domains and designated them forkhead related activators (FREAC) 1 through 7. Northern blot analysis revealed that the FREAC1, or FKHL5, gene is expressed as a 2.6–kb mRNA in placenta and adult and fetal lung. Hellqvist et al. (1996) reported the FREAC1 cDNA sequence. The predicted 354–amino acid protein is nearly identical to FREAC2 (FKHL6; 603250) within a 112–residue region containing the forkhead domain and adjacent sequences, and within the C–terminal region. Using a reporter gene construct containing FREAC2 binding sequences in the promoter, Hellqvist et al. (1996) demonstrated that both FREAC1 and FREAC2 have C–terminal transcriptional activation domains. FREAC1/FREAC2 binding sequences are present in the promoters of several lung–specific genes, including CC10 (OMIM Ref. No. 192020) and SPB (SFTPB; 178640). While both FREAC1 and FREAC2 transactivated

an SPB promoter construct, CC10 was activated only by FREAC1. CC10 activation occurred specifically in a lung cell line with Clara cell-like characteristics. Hellqvist et al. (1996) reported that the mouse HFH8 gene and FREAC1 share 90% nucleotide sequence identity. By resequencing of HFH8, these authors demonstrated that 5 frameshifts in the HFH8 sequence reported by Clevidence et al. (1994) were due to sequencing errors.

[16110] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16111] Clevidence, D. E.; Overdier, D. G.; Peterson, R. S.; Porcella, A.; Ye, H.; Paulson, K. E.; Costa, R. H. : Members of the HNF-3/forkhead family of transcription factors exhibit distinct cellular expression patterns in lung and regulate the surfactant protein B promoter. Dev. Biol. 166: 195-209, 1994. ; and

[16112] Hellqvist, M.; Mahlapuu, M.; Blixt, A.; Enerback, S.; Carlsson, P. : The human forkhead protein FREAC-2 contains two functionally redundant activation domains and interacts with TBP and.

[16113] Further studies establishing the function and utilities of FOXF1 are found in John Hopkins OMIM database record

ID 601089, and in cited publications numbered 9456–9460 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Growth Arrest–specific 11 (GAS11, Accession NM_001481) is another VGAM292 host target gene. GAS11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GAS11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAS11 BINDING SITE, designated SEQ ID:7220, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:3003.

[16114] Another function of VGAM292 is therefore inhibition of Growth Arrest–specific 11 (GAS11, Accession NM_001481). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAS11. NCSTN (Accession XM_057331) is another VGAM292 host target gene. NCSTN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NCSTN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of NCSTN BINDING SITE, designated SEQ ID:36507, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:3003.

[16115] Another function of VGAM292 is therefore inhibition of NCSTN (Accession XM_057331), a gene which has a central role in presenilin-mediated processing of beta-amyloid precursor protein (beta-APP, MIM 104760) and some aspects of notch (MIM 190198)/glp-1 signaling in vivo. Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCSTN. The function of NCSTN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152.Prostaglandin-endoperoxide Synthase 2 (prostaglandin G/H synthase and cyclooxygenase) (PTGS2, Accession NM_000963) is another VGAM292 host target gene. PTGS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTGS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of PTGS2 BINDING SITE, designated SEQ ID:6683, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:3003.

[16116] Another function of VGAM292 is therefore inhibition of Prostaglandin–endoperoxide Synthase 2 (prostaglandin G/H synthase and cyclooxygenase) (PTGS2, Accession NM_000963), a gene which may have a role as a major mediator of inflammation and/or a role for prostanoid signaling in activity–dependent plasticity. Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGS2. The function of PTGS2 has been established by previous studies. Inflammation causes the induction of COX2, leading to the release of prostanoids, which sensitize peripheral nociceptor terminals and produce localized pain hypersensitivity. Peripheral inflammation also generates pain hypersensitivity in neighboring uninjured tissue, because of the increased neuronal excitability in the spinal cord, and a syndrome comprising diffuse muscle and joint pain, fever, lethargy, and anorexia. Samad et al. (2001) showed that COX2 may be involved in central ner–

vous system (CNS) responses, by finding a widespread induction of COX2 expression in spinal cord neurons and in other regions of the CNS, elevating prostaglandin E2 (PGE2) levels in the cerebrospinal fluid. The major inducer of central COX2 upregulation is IL1-beta in the CNS, and as basal phospholipase A2 (see OMIM Ref. No. 600522) activity in the CNS does not change with peripheral inflammation, COX2 levels must regulate central prostanoid production. In the rat, intraspinal administration of an interleukin-converting enzyme or COX2 inhibitor decreased inflammation-induced central PGE2 levels and mechanical hyperalgesia. Thus, Samad et al. (2001) concluded that preventing central prostanoid production by inhibiting the IL1-beta-mediated induction of COX2 in neurons or by inhibiting central COX2 activity reduces centrally generated inflammatory pain hypersensitivity. Animal model experiments lend further support to the function of PTGS2. Morham et al. (1995) noted that cyclooxygenase-2 (COX2) is induced at high levels in migratory and other responding cells by proinflammatory stimuli. COX2 is generally considered to be a mediator of inflammation. Its isoform, COX1, is constitutively expressed in most tissues and is thought to mediate 'housekeeping' functions. These

2 enzymes are therapeutic targets of the widely used non-steroidal antiinflammatory drugs (OMIM Ref. No. NSAIDs). To investigate further the different physiologic roles of these isoforms, Morham et al. (1995) used homologous recombination to disrupt the mouse gene encoding COX2 (Ptgs2). Mice lacking COX2 were found to have normal inflammatory responses to treatments with tetradecanoyl phorbol acetate or arachidonic acid. However, they developed severe nephropathy and were susceptible to peritonitis.

[16117] It is appreciated that the abovementioned animal model for PTGS2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[16118] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16119] Morham, S. G.; Langenbach, R.; Loftin, C. D.; Tiano, H. F.; Vouloumanos, N.; Jennette, J. C.; Mahler, J. F.; Kluckman, K. D.; Ledford, A.; Lee, C. A.; Smithies, O. : Prostaglandin synthase 2 gene disruption causes severe renal pathology in the mouse. *Cell* 83: 473–482, 1995. ; and

[16120] Samad, T. A.; Moore, K. A.; Sapirstein, A.; Billet, S.; All–

chorne, A.; Poole, S.; Bonventre, J. V.; Woolf, C. J. : Inter-leukin-1-beta-mediated induction of Cox-2 in the CNS contributes.

[16121] Further studies establishing the function and utilities of PTGS2 are found in John Hopkins OMIM database record ID 600262, and in cited publications numbered 7932, 10848-7934, 10849-7937, 8080-8086, 10841, 11170, 8090-809 and 10887 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RNA Guanylyltransferase and 5'-phosphatase (RNGTT, Accession NM_003800) is another VGAM292 host target gene. RNGTT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNGTT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNGTT BINDING SITE, designated SEQ ID:9896, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:3003.

[16122] Another function of VGAM292 is therefore inhibition of RNA Guanylyltransferase and 5'-phosphatase (RNGTT, Accession NM_003800), a gene which is an mRNA capping

enzyme; bifunctional enzyme containing both 5'-triphosphatase and mRNA guanylyltransferase activity. Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNGTT. The function of RNGTT has been established by previous studies. Independently, both Tsukamoto et al. (1998) and Yamada-Okabe et al. (1998) cloned cDNAs encoding RNGTT, which they designated CAP1a and HCE1 (human capping enzyme-1), respectively. Using RT-PCR, Tsukamoto et al. (1998) demonstrated CAP1a expression in all human tissues tested. Yamada-Okabe et al. (1998) found that recombinant HCE1 protein displayed RNA 5-prime-triphosphatase and guanylyltransferase activities and formed a cap structure at the 5-prime-triphosphate end of RNA. These authors also identified HCE1A and HCE1B, alternatively spliced mRNAs encoding proteins lacking part of the C-terminal region. The shorter isoforms possessed only RNA 5-prime-triphosphatase activity. HCE1, but not HCE1A or HCE1B, complemented *S. cerevisiae* *ceg1* and *cet1* mutations. Yamada-Okabe et al. (1998) concluded that the N-terminal part of HCE1 is responsible for RNA 5-prime-triphosphatase activity and the C-terminal part

is essential for guanylyltransferase activity. RT-PCR analysis indicated that the level of HCE1 mRNA was significantly higher than those of HCE1A and HCE1B.

[16123] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16124] Tsukamoto, T.; Shibagaki, Y.; Murakoshi, T.; Suzuki, M.; Nakamura, A.; Gotoh, H.; Mizumoto, K. : Cloning and characterization of two human cDNAs encoding the mRNA capping enzyme. *Biochem. Biophys. Res. Commun.* 243: 101-108, 1998. ; and

[16125] Yamada-Okabe, T.; Doi, R.; Shimmi, O.; Arisawa, M.; Yamada-Okabe, H. : Isolation and characterization of a human cDNA for mRNA 5-prime-capping enzyme. *Nucleic Acids Res.* 26: 1700-1706, 1998.

[16126] Further studies establishing the function and utilities of RNGTT are found in John Hopkins OMIM database record ID 603512, and in cited publications numbered 1105-1108 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ATPase, Class II, Type 9A (ATP9A, Accession XM_030577) is another VGAM292 host target gene. ATP9A BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by ATP9A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP9A BINDING SITE, designated SEQ ID:31086, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:3003.

[16127] Another function of VGAM292 is therefore inhibition of ATPase, Class II, Type 9A (ATP9A, Accession XM_030577). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP9A. BDG-29 (Accession XM_051343) is another VGAM292 host target gene. BDG-29 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BDG-29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BDG-29 BINDING SITE, designated SEQ ID:35814, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:3003.

[16128] Another function of VGAM292 is therefore inhibition of BDG-29 (Accession XM_051343). Accordingly, utilities of

VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BDG-29. CPR2 (Accession NM_030900) is another VGAM292 host target gene. CPR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CPR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPR2 BINDING SITE, designated SEQ ID:25177, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:3003.

[16129] Another function of VGAM292 is therefore inhibition of CPR2 (Accession NM_030900). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPR2. DKFZp761D221 (Accession NM_032291) is another VGAM292 host target gene. DKFZp761D221 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761D221, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DK-

FZp761D221 BINDING SITE, designated SEQ ID:26057, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:3003.

[16130] Another function of VGAM292 is therefore inhibition of DKFZp761D221 (Accession NM_032291). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761D221. Erythroblast Membrane-associated Protein (ERMAP, Accession NM_018538) is another VGAM292 host target gene. ERMAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ERMAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERMAP BINDING SITE, designated SEQ ID:20606, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:3003.

[16131] Another function of VGAM292 is therefore inhibition of Erythroblast Membrane-associated Protein (ERMAP, Accession NM_018538). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERMAP. F-box Only

Protein 5 (FBXO5, Accession NM_012177) is another VGAM292 host target gene. FBXO5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FBXO5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO5 BINDING SITE, designated SEQ ID:14466, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:3003.

[16132] Another function of VGAM292 is therefore inhibition of F-box Only Protein 5 (FBXO5, Accession NM_012177). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO5. FLJ10450 (Accession NM_018095) is another VGAM292 host target gene. FLJ10450 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10450 BINDING SITE, designated SEQ ID:19863, to the nucleotide sequence of VGAM292 RNA, herein designated

VGAM RNA, also designated SEQ ID:3003.

[16133] Another function of VGAM292 is therefore inhibition of FLJ10450 (Accession NM_018095). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10450. FLJ22009 (Accession XM_015700) is another VGAM292 host target gene. FLJ22009 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22009 BINDING SITE, designated SEQ ID:30244, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:3003.

[16134] Another function of VGAM292 is therefore inhibition of FLJ22009 (Accession XM_015700). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22009. KIAA1204 (Accession XM_045011) is another VGAM292 host target gene. KIAA1204 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1204, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1204 BINDING SITE, designated SEQ ID:34316, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:3003.

[16135] Another function of VGAM292 is therefore inhibition of KIAA1204 (Accession XM_045011). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1204. KIAA1458 (Accession XM_044434) is another VGAM292 host target gene. KIAA1458 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1458, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1458 BINDING SITE, designated SEQ ID:34206, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:3003.

[16136] Another function of VGAM292 is therefore inhibition of KIAA1458 (Accession XM_044434). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1458. MGC24447 (Accession NM_138288) is another VGAM292 host target gene. MGC24447 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC24447, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC24447 BINDING SITE, designated SEQ ID:28702, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:3003.

[16137] Another function of VGAM292 is therefore inhibition of MGC24447 (Accession NM_138288). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC24447. MST4 (Accession NM_016542) is another VGAM292 host target gene. MST4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MST4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MST4 BINDING SITE, designated SEQ ID:18610, to the nucleotide sequence of

VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:3003.

[16138] Another function of VGAM292 is therefore inhibition of MST4 (Accession NM_016542). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MST4. STRIN (Accession NM_016271) is another VGAM292 host target gene. STRIN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STRIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STRIN BINDING SITE, designated SEQ ID:18396, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:3003.

[16139] Another function of VGAM292 is therefore inhibition of STRIN (Accession NM_016271). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STRIN. LOC145622 (Accession XM_085186) is another VGAM292 host target gene. LOC145622 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of

mRNA encoded by LOC145622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145622 BINDING SITE, designated SEQ ID:37912, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:3003.

[16140] Another function of VGAM292 is therefore inhibition of LOC145622 (Accession XM_085186). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145622. LOC219401 (Accession XM_166706) is another VGAM292 host target gene. LOC219401 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219401 BINDING SITE, designated SEQ ID:44596, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:3003.

[16141] Another function of VGAM292 is therefore inhibition of LOC219401 (Accession XM_166706). Accordingly, utilities

of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219401. LOC257443 (Accession XM_171072) is another VGAM292 host target gene. LOC257443 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257443, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257443 BINDING SITE, designated SEQ ID:45874, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:3003.

[16142] Another function of VGAM292 is therefore inhibition of LOC257443 (Accession XM_171072). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257443. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 293 (VGAM293) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16143] VGAM293 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM293 was detected is described hereinabove with reference to Figs. 1–8.

[16144] VGAM293 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM293 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16145] VGAM293 gene encodes a VGAM293 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM293 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM293 precursor RNA is designated SEQ ID:279, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:279 is located at position 23397 relative to the genome of Epiphyas Postvittana Nucleopolyhedrovirus.

[16146] VGAM293 precursor RNA folds onto itself, forming VGAM293 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16147] An enzyme complex designated DICER COMPLEX, `dices` the VGAM293 folded precursor RNA into VGAM293 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM293 RNA is designated SEQ ID:3004, and is provided hereinbelow with reference to the sequence listing part.

[16148] VGAM293 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM293 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM293 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[16149] VGAM293 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM293 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM293 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM293 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM293 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16150] The complementary binding of VGAM293 RNA, herein designated VGAM RNA, to host target binding sites on VGAM293 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM293 host target RNA into VGAM293 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16151] It is appreciated that VGAM293 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM293 host target genes. The mRNA of each one of this plurality of VGAM293 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM293 RNA, herein designated VGAM RNA, and which when bound by VGAM293 RNA causes inhibition of translation of respective one or more VGAM293 host target proteins.

[16152] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM293 gene, herein designated VGAM GENE, on one or more VGAM293 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16153] It is yet further appreciated that a function of VGAM293 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM293 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM293 correlate with, and may be deduced from, the identity of the host target genes which VGAM293 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16154] Nucleotide sequences of the VGAM293 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM293 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM293 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM293 are further
described hereinbelow with reference to Table 1.

[16155] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM293 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM293 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[16156] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM293 gene, herein designated VGAM is
inhibition of expression of VGAM293 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM293 correlate with, and may be deduced
from, the identity of the target genes which VGAM293
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[16157] HTRA3 (Accession XM_114416) is a VGAM293 host target
gene. HTRA3 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by HTRA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTRA3 BINDING SITE, designated SEQ ID:42944, to the nucleotide sequence of VGAM293 RNA, herein designated VGAM RNA, also designated SEQ ID:3004.

[16158] A function of VGAM293 is therefore inhibition of HTRA3 (Accession XM_114416). Accordingly, utilities of VGAM293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTRA3. Kallmann Syndrome 1 Sequence (KAL1, Accession NM_000216) is another VGAM293 host target gene. KAL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KAL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KAL1 BINDING SITE, designated SEQ ID:5720, to the nucleotide sequence of VGAM293 RNA, herein designated VGAM RNA, also designated SEQ ID:3004.

[16159] Another function of VGAM293 is therefore inhibition of

Kallmann Syndrome 1 Sequence (KAL1, Accession NM_000216). Accordingly, utilities of VGAM293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KAL1. Solute Carrier Family 6 (neurotransmitter transporter, betaine/GABA), Member 12 (SLC6A12, Accession NM_003044) is another VGAM293 host target gene. SLC6A12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC6A12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A12 BINDING SITE, designated SEQ ID:9011, to the nucleotide sequence of VGAM293 RNA, herein designated VGAM RNA, also designated SEQ ID:3004.

[16160] Another function of VGAM293 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter, betaine/GABA), Member 12 (SLC6A12, Accession NM_003044), a gene which transports betaine and gaba. Accordingly, utilities of VGAM293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A12. The function of SLC6A12 has been established by previous studies. Yamauchi et al.

(1992) stated that Madin–Darby canine kidney (MDCK) cells accumulate betaine when cultured in hypertonic media. They isolated an MDCK cell cDNA encoding a renal betaine transporter and designated it BGT1. When expressed in *Xenopus* oocytes, the BGT1 protein exhibited chloride– and sodium–dependent transport of both betaine and the neurotransmitter GABA. Northern blot analysis revealed that BGT1 expression is limited to the canine kidney medulla and is induced in MDCK cells by hypertonicity. Using the canine BGT1 sequence, Rasola et al. (1995) isolated a cDNA from a kidney library encoding the human homolog. The predicted 614–amino acid human protein has the typical structure of neurotransmitter transporters, with 12 transmembrane domains and a large extracellular loop between the third and fourth transmembrane domains. Northern blot analysis indicated that BGT1 is expressed as several mRNAs in human kidney and other tissues. Borden et al. (1995) also isolated human BGT1 cDNAs and reported that the human protein shares 91% and 87% sequence identity with canine and mouse BGT1, respectively. Heterologous expression of human BGT1 in mammalian cells conferred high–affinity GABA uptake.

[16161] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16162] Yamauchi, A.; Uchida, S.; Kwon, H. M.; Preston, A. S.; Robey, R. B.; Garcia-Perez, A.; Burg, M. B.; Handler, J. S. : Cloning of a Na(+) and Cl(-)-dependent betaine transporter that is regulated by hypertonicity. *J. Biol. Chem.* 267: 649-652, 1992. ; and

[16163] Rasola, A.; Galletta, L. J. V.; Barone, V.; Romeo, G.; Bagnasco, S. : Molecular cloning and functional characterization of a GABA/betaine transporter from human kidney. *FEBS Lett.* 373: 22.

[16164] Further studies establishing the function and utilities of SLC6A12 are found in John Hopkins OMIM database record ID 603080, and in cited publications numbered 1068-1070 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 18 (KOX 11) (ZNF18, Accession XM_085596) is another VGAM293 host target gene. ZNF18 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of ZNF18 BINDING SITE, designated SEQ ID:38250, to the nucleotide sequence of VGAM293 RNA, herein designated VGAM RNA, also designated SEQ ID:3004.

[16165] Another function of VGAM293 is therefore inhibition of Zinc Finger Protein 18 (KOX 11) (ZNF18, Accession XM_085596). Accordingly, utilities of VGAM293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF18. ABLIM (Accession NM_002313) is another VGAM293 host target gene. ABLIM BINDING SITE1 and ABLIM BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABLIM, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABLIM BINDING SITE1 and ABLIM BINDING SITE2, designated SEQ ID:8120 and SEQ ID:13553 respectively, to the nucleotide sequence of VGAM293 RNA, herein designated VGAM RNA, also designated SEQ ID:3004.

[16166] Another function of VGAM293 is therefore inhibition of ABLIM (Accession NM_002313). Accordingly, utilities of VGAM293 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with ABLIM. ATPW (Accession NM_015684) is another VGAM293 host target gene. ATPW BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ATPW, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATPW BINDING SITE, designated SEQ ID:17909, to the nucleotide sequence of VGAM293 RNA, herein designated VGAM RNA, also designated SEQ ID:3004.

[16167] Another function of VGAM293 is therefore inhibition of ATPW (Accession NM_015684). Accordingly, utilities of VGAM293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATPW. KIAA1371 (Accession XM_114371) is another VGAM293 host target gene. KIAA1371 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1371 BINDING SITE, designated SEQ ID:42906, to the nucleotide sequence of

VGAM293 RNA, herein designated VGAM RNA, also designated SEQ ID:3004.

[16168] Another function of VGAM293 is therefore inhibition of KIAA1371 (Accession XM_114371). Accordingly, utilities of VGAM293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1371. KIAA1462 (Accession XM_166132) is another VGAM293 host target gene. KIAA1462 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1462 BINDING SITE, designated SEQ ID:43922, to the nucleotide sequence of VGAM293 RNA, herein designated VGAM RNA, also designated SEQ ID:3004.

[16169] Another function of VGAM293 is therefore inhibition of KIAA1462 (Accession XM_166132). Accordingly, utilities of VGAM293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1462. KIAA1643 (Accession XM_035371) is another VGAM293 host target gene. KIAA1643 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1643, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1643 BINDING SITE, designated SEQ ID:32238, to the nucleotide sequence of VGAM293 RNA, herein designated VGAM RNA, also designated SEQ ID:3004.

[16170] Another function of VGAM293 is therefore inhibition of KIAA1643 (Accession XM_035371). Accordingly, utilities of VGAM293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1643. MGC13251 (Accession NM_032714) is another VGAM293 host target gene. MGC13251 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13251 BINDING SITE, designated SEQ ID:26437, to the nucleotide sequence of VGAM293 RNA, herein designated VGAM RNA, also designated SEQ ID:3004.

[16171] Another function of VGAM293 is therefore inhibition of MGC13251 (Accession NM_032714). Accordingly, utilities

of VGAM293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13251. MGC15476 (Accession NM_145056) is another VGAM293 host target gene. MGC15476 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC15476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15476 BINDING SITE, designated SEQ ID:29690, to the nucleotide sequence of VGAM293 RNA, herein designated VGAM RNA, also designated SEQ ID:3004.

[16172] Another function of VGAM293 is therefore inhibition of MGC15476 (Accession NM_145056). Accordingly, utilities of VGAM293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15476. LOC114971 (Accession XM_054936) is another VGAM293 host target gene. LOC114971 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC114971, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC114971 BINDING SITE, designated SEQ ID:36210, to the nucleotide sequence of VGAM293 RNA, herein designated VGAM RNA, also designated SEQ ID:3004.

[16173] Another function of VGAM293 is therefore inhibition of LOC114971 (Accession XM_054936). Accordingly, utilities of VGAM293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC114971. LOC144848 (Accession XM_056770) is another VGAM293 host target gene. LOC144848 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144848 BINDING SITE, designated SEQ ID:36423, to the nucleotide sequence of VGAM293 RNA, herein designated VGAM RNA, also designated SEQ ID:3004.

[16174] Another function of VGAM293 is therefore inhibition of LOC144848 (Accession XM_056770). Accordingly, utilities of VGAM293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144848. LOC201181 (Accession XM_113916) is another VGAM293 host target gene. LOC201181 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201181, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201181 BINDING SITE, designated SEQ ID:42534, to the nucleotide sequence of VGAM293 RNA, herein designated VGAM RNA, also designated SEQ ID:3004.

[16175] Another function of VGAM293 is therefore inhibition of LOC201181 (Accession XM_113916). Accordingly, utilities of VGAM293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201181. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 294 (VGAM294) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16176] VGAM294 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM294 was detected is described hereinabove with reference to Figs. 1-8.

[16177] VGAM294 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM294 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16178] VGAM294 gene encodes a VGAM294 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM294 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM294 precursor RNA is designated SEQ ID:280, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:280 is located at position 77095 relative to the genome of Epiphyas Postvittana Nucleopolyhedrovirus.

[16179] VGAM294 precursor RNA folds onto itself, forming VGAM294 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[16180] An enzyme complex designated DICER COMPLEX, `dices` the VGAM294 folded precursor RNA into VGAM294 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM294 RNA is designated SEQ ID:3005, and is provided hereinbelow with reference to the sequence listing part.

[16181] VGAM294 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM294 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM294 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[16182] VGAM294 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM294 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM294 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM294 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM294 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16183] The complementary binding of VGAM294 RNA, herein designated VGAM RNA, to host target binding sites on VGAM294 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM294 host target RNA into VGAM294 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16184] It is appreciated that VGAM294 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM294 host target genes. The mRNA of each one of this plurality of VGAM294 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM294 RNA, herein designated VGAM RNA, and which when bound by VGAM294 RNA causes inhibition of translation of respective one or more VGAM294 host target proteins.

[16185] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM294 gene, herein designated VGAM GENE, on one or more VGAM294 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16186] It is yet further appreciated that a function of VGAM294 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM294 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM294 correlate with, and may be deduced from, the identity of the host target genes which VGAM294 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16187] Nucleotide sequences of the VGAM294 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM294 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM294 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM294 are further described hereinbelow with reference to Table 1.

[16188] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM294 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM294 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16189] As mentioned hereinabove with reference to Fig. 1, a function of VGAM294 gene, herein designated VGAM is inhibition of expression of VGAM294 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM294 correlate with, and may be deduced from, the identity of the target genes which VGAM294 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16190] Interleukin 22 Receptor, Alpha 2 (IL22RA2, Accession NM_052962) is a VGAM294 host target gene. IL22RA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL22RA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of IL22RA2 BINDING SITE, designated SEQ ID:27523, to the nucleotide sequence of VGAM294 RNA, herein designated VGAM RNA, also designated SEQ ID:3005.

[16191] A function of VGAM294 is therefore inhibition of Interleukin 22 Receptor, Alpha 2 (IL22RA2, Accession NM_052962), a gene which induces the production of acute-phase reactants. Accordingly, utilities of VGAM294 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL22RA2. The function of IL22RA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM167.Solute Carrier Family 1 (glial high affinity glutamate transporter), Member 3 (SLC1A3, Accession NM_004172) is another VGAM294 host target gene. SLC1A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC1A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A3 BINDING SITE, designated SEQ

ID:10384, to the nucleotide sequence of VGAM294 RNA, herein designated VGAM RNA, also designated SEQ ID:3005.

[16192] Another function of VGAM294 is therefore inhibition of Solute Carrier Family 1 (glial high affinity glutamate transporter), Member 3 (SLC1A3, Accession NM_004172), a gene which is a transporter molecule that regulates neurotransmitter concentrations at excitatory synapses of the mammalian CNS. Accordingly, utilities of VGAM294 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A3. The function of SLC1A3 has been established by previous studies.

Kirschner et al. (1994) mapped the human EAAT1 gene to 5p13 by fluorescence in situ hybridization. They used interspecific backcross analysis to map the murine homolog to chromosome 15 in a region of homology to human 5p13. They commented that the EAAT1 locus may be related to the syndrome of microcephaly and mental retardation observed by Keppen et al. (1992) in association with interstitial deletion of distal band 5p13. In the retina, the glutamate transporter GLAST is expressed in Muller cells, whereas the glutamate transporter GLT1 is found only in cones and various types of bipolar cells. To inves-

tigate the functional role of this differential distribution of glutamate transporters, Harada et al. (1998) analyzed Glst and Glt1 mutant mice. In Glst-deficient mice, the electroretinogram b-wave and oscillatory potentials were reduced and retinal damage after ischemia was exacerbated, whereas Glt1-deficient mice showed almost normal electroretinograms and mildly increased retinal damage after ischemia. These results demonstrated that Glst is required for normal signal transmission between photoreceptors and bipolar cells and that both Glst and Glt1 play a neuroprotective role during ischemia in the retina.

[16193] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16194] Kirschner, M. A.; Arriza, J. L.; Copeland, N. G.; Gilbert, D. J.; Jenkins, N. A.; Magenis, E.; Amara, S. G. : The mouse and human excitatory amino acid transporter gene (EAAT1) maps to mouse chromosome 15 and a region of syntenic homology on human chromosome 5. *Genomics* 22: 631–633, 1994. ; and

[16195] Harada, T.; Harada, C.; Watanabe, M.; Inoue, Y.; Sakagawa, T.; Nakayama, N.; Sasaki, S.; Okuyama, S.; Watase, K.; Wada, K.; Tanaka, K. : Functions of the two glutamate

transporters GLAST a.

[16196] Further studies establishing the function and utilities of SLC1A3 are found in John Hopkins OMIM database record ID 600111, and in cited publications numbered 2918–2924 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ubiquitin–conjugating Enzyme E2A (RAD6 homolog) (UBE2A, Accession NM_003336) is another VGAM294 host target gene. UBE2A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UBE2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2A BINDING SITE, designated SEQ ID:9342, to the nucleotide sequence of VGAM294 RNA, herein designated VGAM RNA, also designated SEQ ID:3005.

[16197] Another function of VGAM294 is therefore inhibition of Ubiquitin–conjugating Enzyme E2A (RAD6 homolog) (UBE2A, Accession NM_003336), a gene which catalyzes the covalent attachment of ubiquitin to other proteins and is required for postreplication repair of uv–damaged dna. Accordingly, utilities of VGAM294 include diagnosis, pre–

vention and treatment of diseases and clinical conditions associated with UBE2A. The function of UBE2A has been established by previous studies. As deduced from the pleiotropic phenotype of rad6 deletion mutants in *Saccharomyces cerevisiae*, the RAD6 protein plays an important role in various cellular processes. The protein is strongly conserved in eukaryotic evolution, a property that permitted Koken et al. (1991) to clone human homologs by evolutionary walking using *Schizosaccharomyces pombe* and *Drosophila melanogaster* homologs as 'intermediates.' The human HHR6A and HHR6B proteins (HHR for human homolog of rad6) shared about 95% amino acid sequence identity with each other and about 70% amino acid sequence with their yeast counterparts, but notably lacked the acidic C-terminal domain, the occurrence of which seemed to be limited to *S. cerevisiae* rad6. By in situ hybridization with biotinylated probes, Koken et al. (1992) localized the RAD6A gene to Xq24-q25 and the RAD6B gene (OMIM Ref. No. 179095) to 5q23-q31. The assignment of RAD6A to the X chromosome was confirmed with an X-specific human-mouse/hamster somatic cell hybrid panel. This gene is also symbolized UBE2A (for ubiquitin-conjugating enzyme E2A).

- [16198] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [16199] Koken, M. H. M.; Reynolds, P.; Jaspers–Dekker, I.; Prakash, L.; Prakash, S.; Bootsma, D.; Hoeijmakers, J. H. J. : Structural and functional conservation of two human homologs of the yeast DNA repair gene RAD6. Proc. Nat. Acad. Sci. 88: 8865–8869, 1991. ; and
- [16200] Koken, M. H. M.; Smit, E. M. E.; Jaspers–Dekker, I.; Oostra, B. A.; Hagemeyer, A.; Bootsma, D.; Hoeijmakers, J. H. J. : Localization of two human homologs, HHR6A and HHR6B, of the yeas.
- [16201] Further studies establishing the function and utilities of UBE2A are found in John Hopkins OMIM database record ID 312180, and in cited publications numbered 8412 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0193 (Accession NM_014766) is another VGAM294 host target gene. KIAA0193 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu–

cleotide sequences of KIAA0193 BINDING SITE, designated SEQ ID:16545, to the nucleotide sequence of VGAM294 RNA, herein designated VGAM RNA, also designated SEQ ID:3005.

[16202] Another function of VGAM294 is therefore inhibition of KIAA0193 (Accession NM_014766). Accordingly, utilities of VGAM294 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0193. KIAA0972 (Accession NM_014930) is another VGAM294 host target gene. KIAA0972 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0972, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0972 BINDING SITE, designated SEQ ID:17227, to the nucleotide sequence of VGAM294 RNA, herein designated VGAM RNA, also designated SEQ ID:3005.

[16203] Another function of VGAM294 is therefore inhibition of KIAA0972 (Accession NM_014930). Accordingly, utilities of VGAM294 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0972. LOC145231 (Accession XM_096740) is another

VGAM294 host target gene. LOC145231 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145231 BINDING SITE, designated SEQ ID:40520, to the nucleotide sequence of VGAM294 RNA, herein designated VGAM RNA, also designated SEQ ID:3005.

[16204] Another function of VGAM294 is therefore inhibition of LOC145231 (Accession XM_096740). Accordingly, utilities of VGAM294 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145231. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 295 (VGAM295) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16205] VGAM295 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM295 was detected is described

hereinabove with reference to Figs. 1–8.

[16206] VGAM295 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM295 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16207] VGAM295 gene encodes a VGAM295 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM295 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM295 precursor RNA is designated SEQ ID:281, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:281 is located at position 83820 relative to the genome of Epiphyas Postvittana Nucleopolyhedrovirus.

[16208] VGAM295 precursor RNA folds onto itself, forming VGAM295 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16209] An enzyme complex designated DICER COMPLEX, `dices` the VGAM295 folded precursor RNA into VGAM295 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM295 RNA is designated SEQ ID:3006, and is provided hereinbelow with reference to the sequence listing part.

[16210] VGAM295 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM295 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM295 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[16211] VGAM295 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM295 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM295 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM295 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM295 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16212] The complementary binding of VGAM295 RNA, herein designated VGAM RNA, to host target binding sites on VGAM295 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM295 host target RNA into VGAM295 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16213] It is appreciated that VGAM295 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM295 host target genes. The mRNA of each one of this plurality of VGAM295 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM295 RNA, herein designated VGAM RNA, and which when bound by VGAM295 RNA causes inhibition of translation of respective one or more VGAM295 host target proteins.

[16214] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM295 gene, herein designated VGAM GENE, on one or more VGAM295 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16215] It is yet further appreciated that a function of VGAM295 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM295 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM295 correlate with, and may be deduced from, the identity of the host target genes which VGAM295 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16216] Nucleotide sequences of the VGAM295 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM295 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM295 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM295 are further described hereinbelow with reference to Table 1.

[16217] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM295 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM295 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16218] As mentioned hereinabove with reference to Fig. 1, a function of VGAM295 gene, herein designated VGAM is inhibition of expression of VGAM295 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM295 correlate with, and may be deduced from, the identity of the target genes which VGAM295 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16219] Adenylate Cyclase 7 (ADCY7, Accession NM_001114) is a VGAM295 host target gene. ADCY7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADCY7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY7 BINDING SITE, designated SEQ ID:6779, to the nucleotide sequence of VGAM295 RNA, herein designated VGAM RNA, also designated SEQ ID:3006.

[16220] A function of VGAM295 is therefore inhibition of Adenylate Cyclase 7 (ADCY7, Accession NM_001114), a gene which this a membrane-bound, Ca^{2+} -inhibitable adenylyl cyclase. Accordingly, utilities of VGAM295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY7. The function of ADCY7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM108. Junctophilin 2 (JPH2, Accession XM_170491) is another VGAM295 host target gene. JPH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JPH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JPH2 BINDING SITE, designated SEQ ID:45332, to the nucleotide sequence of VGAM295 RNA, herein designated VGAM RNA,

also designated SEQ ID:3006.

[16221] Another function of VGAM295 is therefore inhibition of Junctophilin 2 (JPH2, Accession XM_170491), a gene which mediates cross talk between cell surface and intracellular ion channels. Accordingly, utilities of VGAM295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JPH2. The function of JPH2 has been established by previous studies. Junctional complexes between the plasma membrane (PM) and endoplasmic/sarcoplasmic reticulum (ER/SR) are a common feature of all excitable cell types and mediate cross talk between cell surface and intracellular ion channels. Takeshima et al. (2000) identified the junctophilins (JPs), a conserved family of proteins that are components of the junctional complexes. JPs are composed of a C-terminal hydrophobic segment spanning the ER/SR membrane and a remaining cytoplasmic domain that shows specific affinity for the PM. In mouse, there are at least 3 JP subtypes: Jp1, Jp2, and Jp3. By screening genomic DNA libraries, Nishi et al. (2000) isolated the human JP1 (OMIM Ref. No. 605266) and JP2 genes, and by screening a brain cDNA library, they isolated a cDNA encoding human JP3 (OMIM Ref. No. 605268). The JP2 gene encodes a deduced 696-amino

acid protein. The human JPs share an overall sequence identity of 39%, and they share characteristic structural features with their rabbit and mouse counterparts. RNA blot hybridization indicated that the tissue-specific expression patterns of the JP genes in human are essentially the same as those in mouse; JP1 was expressed as a 4.5-kb transcript in skeletal muscle and at low levels in heart, JP2 was expressed as a 4.1-kb transcript in heart and skeletal muscle, and JP3 was expressed as a 4.6-kb transcript in brain. The protein-coding sequence is interrupted by 4 introns in each JP gene. By FISH, Nishi et al. (2000) mapped the JP2 gene to 20q12 and determined that the JP genes do not cluster on the human genome. Takeshima et al. (2000) showed that Jp2 is abundantly expressed in mouse heart, and mutant mice lacking Jp2 exhibited embryonic lethality. Cardiac myocytes from the mutant mice showed deficiency of the junctional membrane complexes and abnormal calcium transients. These results suggested that JPs are important components of junctional membrane complexes.

[16222] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [16223] Nishi, M.; Mizushima, A.; Nakagawara, K.; Takeshima, H. : Characterization of human junctophilin subtype genes. Biochem. Biophys. Res. Commun. 273: 920–927, 2000. ; and
- [16224] Takeshima, H.; Komazaki, S.; Nishi, M.; Iino, M.; Kangawa, K. : Junctophilins: a novel family of junctional membrane complex proteins. Molec. Cell 6: 11–22, 2000.
- [16225] Further studies establishing the function and utilities of JPH2 are found in John Hopkins OMIM database record ID 605267, and in cited publications numbered 5036–5037 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP564O0423 (Accession XM_166254) is another VGAM295 host target gene. DKFZP564O0423 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP564O0423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O0423 BINDING SITE, designated SEQ ID:44061, to the nucleotide sequence of VGAM295 RNA, herein designated VGAM RNA, also designated SEQ ID:3006.
- [16226] Another function of VGAM295 is therefore inhibition of

DKFZP564O0423 (Accession XM_166254). Accordingly, utilities of VGAM295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O0423. LOC124801 (Accession XM_058850) is another VGAM295 host target gene.

LOC124801 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124801, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124801 BINDING SITE, designated SEQ ID:36763, to the nucleotide sequence of VGAM295 RNA, herein designated VGAM RNA, also designated SEQ ID:3006.

[16227] Another function of VGAM295 is therefore inhibition of LOC124801 (Accession XM_058850). Accordingly, utilities of VGAM295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124801. LOC57086 (Accession NM_020351) is another VGAM295 host target gene. LOC57086 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC57086, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57086 BINDING SITE, designated SEQ ID:21618, to the nucleotide sequence of VGAM295 RNA, herein designated VGAM RNA, also designated SEQ ID:3006.

[16228] Another function of VGAM295 is therefore inhibition of LOC57086 (Accession NM_020351). Accordingly, utilities of VGAM295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57086. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 296 (VGAM296) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16229] VGAM296 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM296 was detected is described hereinabove with reference to Figs. 1–8.

[16230] VGAM296 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM296 host target gene, herein

designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16231] VGAM296 gene encodes a VGAM296 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM296 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM296 precursor RNA is designated SEQ ID:282, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:282 is located at position 80889 relative to the genome of Epi-phyas Postvittana Nucleopolyhedrovirus.

[16232] VGAM296 precursor RNA folds onto itself, forming VGAM296 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16233] An enzyme complex designated DICER COMPLEX, `dices` the VGAM296 folded precursor RNA into VGAM296 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM296 RNA is designated SEQ ID:3007, and is provided hereinbelow with reference to the sequence listing part.

[16234] VGAM296 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM296 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM296 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[16235] VGAM296 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM296 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM296 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM296 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM296 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16236] The complementary binding of VGAM296 RNA, herein designated VGAM RNA, to host target binding sites on VGAM296 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM296 host target RNA into VGAM296 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[16237] It is appreciated that VGAM296 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM296 host target genes. The mRNA of each one of this plurality of VGAM296 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM296 RNA, herein designated VGAM RNA, and which when bound by VGAM296 RNA causes inhibition of translation of respective one or more VGAM296 host target proteins.

[16238] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM296 gene, herein designated VGAM GENE, on one or more VGAM296 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16239] It is yet further appreciated that a function of VGAM296 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM296 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM296 correlate with, and may be deduced from, the identity of the host target genes which VGAM296 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16240] Nucleotide sequences of the VGAM296 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM296 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM296 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM296 are further described hereinbelow with reference to Table 1.

[16241] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM296 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM296 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16242] As mentioned hereinabove with reference to Fig. 1, a function of VGAM296 gene, herein designated VGAM is inhibition of expression of VGAM296 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM296 correlate with, and may be deduced from, the identity of the target genes which VGAM296 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16243] Calcium Channel, Voltage-dependent, L Type, Alpha 1C Subunit (CACNA1C, Accession NM_000719) is a VGAM296 host target gene. CACNA1C BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CACNA1C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNA1C BINDING SITE, designated SEQ ID:6378, to the nucleotide sequence of

VGAM296 RNA, herein designated VGAM RNA, also designated SEQ ID:3007.

[16244] A function of VGAM296 is therefore inhibition of Calcium Channel, Voltage-dependent, L Type, Alpha 1C Subunit (CACNA1C, Accession NM_000719), a gene which is alpha-1 subunit of DHP-sensitive calcium channels from cardiac muscle and the brain. Accordingly, utilities of VGAM296 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNA1C. The function of CACNA1C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM182. Ubiquitin Specific Protease 6 (Tre-2 onco-gene) (USP6, Accession XM_165948) is another VGAM296 host target gene. USP6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by USP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP6 BINDING SITE, designated SEQ ID:43806, to the nucleotide sequence of VGAM296 RNA, herein designated VGAM RNA, also designated SEQ ID:3007.

[16245] Another function of VGAM296 is therefore inhibition of Ubiquitin Specific Protease 6 (Tre-2 oncogene) (USP6, Accession XM_165948), a gene which has an atp-independent isopeptidase activity, cleaving at the carboxyl terminus of the ubiquitin moiety. Accordingly, utilities of VGAM296 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP6. The function of USP6 has been established by previous studies. The TRE locus was first isolated from NIH 3T3 cells transfected with human Ewing sarcoma DNA (Nakamura et al., 1988). Huebner et al. (1988) found that the locus is discontinuous in human cells and is composed of 3 major genetic elements originating 5-prime to 3-prime from human chromosomes 5, 18, and 17. Nakamura et al. (1992) cloned transcripts from the chromosome 17 portion of TRE from a cDNA library of cytoplasmic poly(A) RNA from TRE-transfected NIH 3T3 tumor cells. They obtained a novel cDNA, the 5-prime part of which overlapped the TRE transcript, and named its locus of origin TRE2. The complete cDNA spans 8,201 bp and possesses an unusually long noncoding region and a translatable region with 2 open reading frames (ORF). In one cDNA clone, the presence of 2 insertion sequences suggested

the possibility of alternative splicing. Transfection-tumorigenicity assays with the ORFs subcloned into expression vectors were positive for the ORF adjacent to the 5-prime noncoding region and negative for the second, downstream ORF. Analysis of the 786-amino acid sequence deduced from the 5-prime ORF predicted a highly hydrophilic protein with 2 charge clusters suggesting nucleic acid-binding properties. When used as a probe, the cloned sequence detected RNA transcripts in a wide variety of human cancer cells regardless of their lineage of origin from different tissues, but not in human cells from normal tissue. By chromosomal in situ hybridization, Nakamura et al. (1992) mapped the TRE2 gene to 17q11.

[16246] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16247] Huebner, K.; Cannizzaro, L. A.; Nakamura, T.; Hillova, J.; Mariage-Samson, R.; Hecht, F.; Hill, M.; Croce, C. M. : A rearranged transforming gene, tre, is made up of human sequences derived from chromosome regions 5q, 17q and 18q. *Oncogene* 3: 449-455, 1988. ; and

[16248] Nakamura, T.; Hillova, J.; Mariage-Samson, R.; Onno, M.; Huebner, K.; Cannizzaro, L. A.; Boghosian-Sell, L.; Croce,

C. M.; Hill, M. : A novel transcriptional unit of the tre oncogene wid.

[16249] Further studies establishing the function and utilities of USP6 are found in John Hopkins OMIM database record ID 604334, and in cited publications numbered 4987–4989 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Olfactomedin 3 (OLFM3, Accession XM_088951) is another VGAM296 host target gene. OLFM3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OLFM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OLFM3 BINDING SITE, designated SEQ ID:39957, to the nucleotide sequence of VGAM296 RNA, herein designated VGAM RNA, also designated SEQ ID:3007.

[16250] Another function of VGAM296 is therefore inhibition of Olfactomedin 3 (OLFM3, Accession XM_088951). Accordingly, utilities of VGAM296 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OLFM3. LOC256714 (Accession XM_172798) is another VGAM296 host target gene. LOC256714 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256714 BINDING SITE, designated SEQ ID:46081, to the nucleotide sequence of VGAM296 RNA, herein designated VGAM RNA, also designated SEQ ID:3007.

[16251] Another function of VGAM296 is therefore inhibition of LOC256714 (Accession XM_172798). Accordingly, utilities of VGAM296 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256714. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 297 (VGAM297) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16252] VGAM297 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM297 was detected is described hereinabove with reference to Figs. 1-8.

[16253] VGAM297 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM297 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16254] VGAM297 gene encodes a VGAM297 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM297 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM297 precursor RNA is designated SEQ ID:283, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:283 is located at position 88463 relative to the genome of Epiphyas Postvittana Nucleopolyhedrovirus.

[16255] VGAM297 precursor RNA folds onto itself, forming VGAM297 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[16256] An enzyme complex designated DICER COMPLEX, `dices` the VGAM297 folded precursor RNA into VGAM297 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM297 RNA is designated SEQ ID:3008, and is provided hereinbelow with reference to the sequence listing part.

[16257] VGAM297 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM297 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM297 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[16258] VGAM297 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM297 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM297 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM297 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM297 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16259] The complementary binding of VGAM297 RNA, herein designated VGAM RNA, to host target binding sites on VGAM297 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM297 host target RNA into VGAM297 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16260] It is appreciated that VGAM297 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM297 host target genes. The mRNA of each one of this plurality of VGAM297 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM297 RNA, herein designated VGAM RNA, and which when bound by VGAM297 RNA causes inhibition of translation of respective one or more VGAM297 host target proteins.

[16261] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM297 gene, herein designated VGAM GENE, on one or more VGAM297 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16262] It is yet further appreciated that a function of VGAM297 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM297 correlate with, and may be deduced from, the identity of the host target genes which VGAM297 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16263] Nucleotide sequences of the VGAM297 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM297 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM297 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM297 are further described hereinbelow with reference to Table 1.

[16264] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM297 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM297 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16265] As mentioned hereinabove with reference to Fig. 1, a function of VGAM297 gene, herein designated VGAM is inhibition of expression of VGAM297 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM297 correlate with, and may be deduced from, the identity of the target genes which VGAM297 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16266] Rho Guanine Nucleotide Exchange Factor (GEF) 7 (ARHGEF7, Accession NM_003899) is a VGAM297 host target gene. ARHGEF7 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ARHGEF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF7 BINDING SITE, designated SEQ ID:9984, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:3008.

[16267] A function of VGAM297 is therefore inhibition of Rho Guanine Nucleotide Exchange Factor (GEF) 7 (ARHGEF7, Accession NM_003899), a gene which acts as a rac1 guanine nucleotide exchange factor (gef) and can induce membrane ruffling. Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF7. The function of ARHGEF7 has been established by previous studies. p21 (CDKN1A; 116899)–activated kinases, or PAKs (e.g., PAK1; 602590), bind to and are activated by Rho family GTPases, such as CDC42 (OMIM Ref. No. 116952) and RAC (see OMIM Ref. No. RAC1; 602048). PAKs are implicated in the regulation of gene expression, cytoskeletal architecture, and apoptosis. By screening rat tissue extracts for binding to PAK1, peptide microsequencing, and primer walking, Manser et al. (1998) isolated a rat cDNA encoding Pixb. Pixb is approximately 97% identical to the human cDNA KIAA0142 identified by Nagase et al. (1995). By

screening a mouse thymus expression cDNA library, Oh et al. (1997) isolated a cDNA encoding p85SPR (85-kD, SH3 domain-containing, proline-rich protein), which is 93% identical to KIAA0142, or human PIXB. Using a yeast 2-hybrid screen with PAK3 (OMIM Ref. No. 300142) as bait, Bagrodia et al. (1998) also isolated PIXB, which they called COOL1, from a HeLa cell cDNA library. Sequence analysis predicted that the 646-amino acid PIXB protein contains an N-terminal SH3 domain, a Dbl-homology (DH) domain, a pleckstrin homology (PH) domain, 2 putative nuclear localization signals, 2 leucine zipper motifs, and a proline-rich region. Northern blot analysis by Manser et al. (1998) revealed ubiquitous expression of an approximately 4.4-kb transcript. By immunofluorescence microscopy, they showed that the SH3 domain of PIXB is required for recruitment of PAK1 to CDC42-driven focal complexes. Their functional analysis demonstrated that PIXB acts as a RAC1 guanine nucleotide exchange factor (GEF) and can induce membrane ruffling.

[16268] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16269] Bagrodia, S.; Taylor, S. J.; Jordon, K. A.; Van Aelst, L.; Ceri-

one, R. A. : A novel regulator of p21-activated kinases. J. Biol. Chem. 273: 23633-23636, 1998. ; and

[16270] Manser, E.; Loo, T.-H.; Koh, C.-G.; Zhao, Z.-S.; Chen, X.-Q.; Tan, L.; Tan, I.; Leung, T.; Lim, L. : PAK kinases are directly coupled to the PIX family of nucleotide exchange factors. M.

[16271] Further studies establishing the function and utilities of ARHGEF7 are found in John Hopkins OMIM database record ID 605477, and in cited publications numbered 6977, 1081 and 10969 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Colony Stimulating Factor 1 Receptor, Formerly McDonough Feline Sarcoma Viral (v-fms) Oncogene Homolog (CSF1R, Accession NM_005211) is another VGAM297 host target gene. CSF1R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSF1R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSF1R BINDING SITE, designated SEQ ID:11710, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:3008.

[16272] Another function of VGAM297 is therefore inhibition of Colony Stimulating Factor 1 Receptor, Formerly McDonough Feline Sarcoma Viral (v-fms) Oncogene Homolog (CSF1R, Accession NM_005211), a gene which is involved in regulation of growth and differentiation of myeloid cells. Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSF1R. The function of CSF1R has been established by previous studies. The FMS oncogene was assigned to chromosome 5 by study of mouse-human somatic cell hybrids. The location was narrowed to 5q34 by the study of hamster-human cell hybrids with well-defined deletions of 5q (Groffen et al., 1984). The order on the long arm was found to be centromere--leuS--HEXB--EMTB--CFMS--CHR. By in situ hybridization, Le Beau et al. (1986) assigned FMS to 5q33 and GM-CSF (OMIM Ref. No. 138960) to 5q23-q31. Both genes were deleted in the 5q- chromosome from bone marrow cells of 2 patients with refractory anemia and del(5)(q15q33.3). From study of other cases they concluded that FMS is located in band 5q33.2 or 5q33.3 rather than 5q34-q35 as reported earlier. The FMS oncogene is the same as the receptor for colony-stimulating

factor-1, otherwise known as macrophage colony-stimulating factor (OMIM Ref. No. 120420). Kondo et al. (2000) showed that a clonogenic common lymphoid progenitor, a bone marrow-resident cell that gives rise exclusively to lymphocytes (T, B, and natural killer cells), can be redirected to the myeloid lineage by stimulation through exogenously expressed interleukin-2 receptor (OMIM Ref. No. 146710) and GM-CSF receptor (138981, 306250). Analysis of mutants of the beta-chain of the IL2 receptor revealed that the granulocyte and monocyte differentiation signals are triggered by different cytoplasmic domains, showing that the signaling pathways responsible for these unique developmental outcomes are separable. Finally, Kondo et al. (2000) showed that the endogenous myelomonocytic cytokine receptors for GM-CSF and macrophage colony-stimulating factor (CSF1R) are expressed at low to moderate levels on the more primitive hematopoietic stem cells, are absent on common lymphoid progenitors, and are upregulated after myeloid lineage induction by IL2 (OMIM Ref. No. 147680). Kondo et al. (2000) concluded that cytokine signaling can regulate cell fate decisions and proposed that a critical step in lymphoid commitment is downregulation of cytokine re-

ceptors that drive myeloid cell development

- [16273] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [16274] Le Beau, M. M.; Westbrook, C. A.; Diaz, M. O.; Larson, R. A.; Rowley, J. D.; Gasson, J. C.; Golde, D. W.; Sherr, C. J. : Evidence for the involvement of GM-CSF and FMS in the deletion (5q) in myeloid disorders. *Science* 231: 984–987, 1986. ; and
- [16275] Kondo, M.; Scherer, D. C.; Miyamoto, T.; King, A. G.; Akashi, K.; Sugamura, K.; Weissman, I. L. : Cell-fate conversion of lymphoid-committed progenitors by instructive actions of cytokine.
- [16276] Further studies establishing the function and utilities of CSF1R are found in John Hopkins OMIM database record ID 164770, and in cited publications numbered 5100–510 and 3818–3826 listed in the bibliography section herein–below, which are also hereby incorporated by reference. RAB27A, Member RAS Oncogene Family (RAB27A, Accession NM_004580) is another VGAM297 host target gene. RAB27A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB27A, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB27A BINDING SITE, designated SEQ ID:10929, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:3008.

[16277] Another function of VGAM297 is therefore inhibition of RAB27A, Member RAS Oncogene Family (RAB27A, Accession NM_004580). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB27A. Transmembrane, Prostate Androgen Induced RNA (TMEPAI, Accession NM_020182) is another VGAM297 host target gene. TMEPAI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TMEPAI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMEPAI BINDING SITE, designated SEQ ID:21406, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:3008.

[16278] Another function of VGAM297 is therefore inhibition of

Transmembrane, Prostate Androgen Induced RNA

(TMEPAI, Accession NM_020182). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMEPAI.

KIAA0367 (Accession XM_041018) is another VGAM297 host target gene. KIAA0367 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0367, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0367 BINDING SITE, designated SEQ ID:33424, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:3008.

[16279] Another function of VGAM297 is therefore inhibition of KIAA0367 (Accession XM_041018). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0367. KIAA0543 (Accession XM_044213) is another VGAM297 host target gene. KIAA0543 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0543, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0543 BINDING SITE, designated SEQ ID:34177, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:3008.

[16280] Another function of VGAM297 is therefore inhibition of KIAA0543 (Accession XM_044213). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0543. KIAA0794 (Accession XM_087353) is another VGAM297 host target gene. KIAA0794 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0794 BINDING SITE, designated SEQ ID:39179, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:3008.

[16281] Another function of VGAM297 is therefore inhibition of KIAA0794 (Accession XM_087353). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0794. KIAA1486 (Accession XM_041126) is another VGAM297 host target gene. KIAA1486 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1486, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1486 BINDING SITE, designated SEQ ID:33462, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:3008.

[16282] Another function of VGAM297 is therefore inhibition of KIAA1486 (Accession XM_041126). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1486. Small EDRK-rich Factor 2 (SERF2, Accession NM_005770) is another VGAM297 host target gene. SERF2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SERF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERF2 BINDING SITE, designated SEQ ID:12342, to the nucleotide sequence of VGAM297 RNA, herein designated

VGAM RNA, also designated SEQ ID:3008.

[16283] Another function of VGAM297 is therefore inhibition of Small EDRK-rich Factor 2 (SERF2, Accession NM_005770). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERF2. LOC158987 (Accession XM_099015) is another VGAM297 host target gene. LOC158987 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158987 BINDING SITE, designated SEQ ID:42047, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:3008.

[16284] Another function of VGAM297 is therefore inhibition of LOC158987 (Accession XM_099015). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158987. LOC165352 (Accession XM_103974) is another VGAM297 host target gene. LOC165352 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC165352, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165352 BINDING SITE, designated SEQ ID:42157, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:3008.

[16285] Another function of VGAM297 is therefore inhibition of LOC165352 (Accession XM_103974). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165352. LOC219649 (Accession XM_167562) is another VGAM297 host target gene. LOC219649 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219649, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219649 BINDING SITE, designated SEQ ID:44666, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:3008.

[16286] Another function of VGAM297 is therefore inhibition of LOC219649 (Accession XM_167562). Accordingly, utilities

of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219649. LOC221692 (Accession XM_166420) is another VGAM297 host target gene. LOC221692 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221692, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221692 BINDING SITE, designated SEQ ID:44299, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:3008.

[16287] Another function of VGAM297 is therefore inhibition of LOC221692 (Accession XM_166420). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221692. LOC90826 (Accession XM_034321) is another VGAM297 host target gene. LOC90826 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC90826 BINDING SITE, designated SEQ ID:32048, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:3008.

[16288] Another function of VGAM297 is therefore inhibition of LOC90826 (Accession XM_034321). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90826. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 298 (VGAM298) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16289] VGAM298 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM298 was detected is described hereinabove with reference to Figs. 1–8.

[16290] VGAM298 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM298 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16291] VGAM298 gene encodes a VGAM298 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM298 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM298 precursor RNA is designated SEQ ID:284, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:284 is located at position 29595 relative to the genome of Epi-phyas Postvittana Nucleopolyhedrovirus.

[16292] VGAM298 precursor RNA folds onto itself, forming VGAM298 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16293] An enzyme complex designated DICER COMPLEX, `dices` the VGAM298 folded precursor RNA into VGAM298 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM298 RNA is designated SEQ ID:3009, and is provided hereinbelow with reference to the sequence listing part.

[16294] VGAM298 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM298 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM298 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[16295] VGAM298 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM298 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM298 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM298 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM298 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[16296] The complementary binding of VGAM298 RNA, herein designated VGAM RNA, to host target binding sites on VGAM298 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM298 host target RNA into VGAM298 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16297] It is appreciated that VGAM298 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM298 host target genes. The mRNA of each one of this plurality of VGAM298 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM298 RNA, herein designated VGAM RNA, and which when bound by VGAM298 RNA causes inhibition of translation of respective one or more VGAM298 host target proteins.

[16298] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM298 gene, herein designated VGAM GENE, on one or more VGAM298 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[16299] It is yet further appreciated that a function of VGAM298 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM298 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM298 correlate with, and may be deduced from, the identity of the host target genes which VGAM298 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16300] Nucleotide sequences of the VGAM298 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM298 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM298 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM298 are further described hereinbelow with reference to Table 1.

[16301] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM298 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM298 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16302] As mentioned hereinabove with reference to Fig. 1, a function of VGAM298 gene, herein designated VGAM is inhibition of expression of VGAM298 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM298 correlate with, and may be deduced from, the identity of the target genes which VGAM298 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16303] CD3Z Antigen, Zeta Polypeptide (TiT3 complex) (CD3Z, Accession NM_000734) is a VGAM298 host target gene. CD3Z BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD3Z, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD3Z BINDING SITE, designated SEQ ID:6390, to the nucleotide sequence of VGAM298 RNA, herein designated VGAM RNA, also designated SEQ ID:3009.

[16304] A function of VGAM298 is therefore inhibition of CD3Z

Antigen, Zeta Polypeptide (TiT3 complex) (CD3Z, Accession NM_000734), a gene which may involve in assembly and expression of the tcr complex as well as signal transduction upon antigen triggering. Accordingly, utilities of VGAM298 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD3Z. The function of CD3Z and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM167.

Cytoplasmic Linker Associated Protein 1 (CLASP1, Accession XM_037105) is another VGAM298 host target gene. CLASP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CLASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLASP1 BINDING SITE, designated SEQ ID:32544, to the nucleotide sequence of VGAM298 RNA, herein designated VGAM RNA, also designated SEQ ID:3009.

[16305] Another function of VGAM298 is therefore inhibition of Cytoplasmic Linker Associated Protein 1 (CLASP1, Accession XM_037105), a gene which plays a role in the local

regulation of microtubule dynamics . Accordingly, utilities of VGAM298 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLASP1. The function of CLASP1 has been established by previous studies. CLIP170 (OMIM Ref. No. 179838) and CLIP115 (OMIM Ref. No. 603432) are cytoplasmic linker proteins that associate specifically with the ends of growing microtubules and may act as anticatastrophe factors. Using a yeast 2-hybrid screen with an N-terminal region of CLIP115 as bait, followed by cDNA library screening, RACE analysis, and EST database searching, Akhmanova et al. (2001) identified mouse and human cDNAs encoding 2 CLIP-associated proteins, CLASP1 and CLASP2 (OMIM Ref. No. 605853). The CLASPs are homologous to a *Drosophila* microtubule-associated protein termed Orbit or Mast. CLASP1 is identical to the protein encoded by a partial cDNA, KIAA0622, identified by Ishikawa et al. (1998), although the KIAA0622 protein lacks the N-terminal 249 amino acids of the 1,538-amino acid CLASP1 protein reported by Akhmanova et al. (2001). CLASP2 shares approximately 75% identity with the KIAA0627 protein, which is encoded by a partial cDNA also identified by Ishikawa et al. (1998). There are several CLASP isoforms

due to alternative splicing. Northern blot analysis of mouse tissues detected highest expression of Clasp1 in brain, heart, and testis, while Clasp2 mRNAs were enriched in the brain. The Clasp2-beta transcript appeared to be brain specific. By RT-PCR analysis, Ishikawa et al. (1998) detected ubiquitous expression of CLASP1, which they called KIAA0622. Akhmanova et al. (2001) showed that CLASPs bind CLIPs and microtubules, colocalize with the CLIPs at microtubule distal ends, and have microtubule-stabilizing effects in transfected cells. After serum induction, CLASPs relocate to distal segments of microtubules at the leading edge of motile fibroblasts. Akhmanova et al. (2001) provided evidence that this asymmetric CLASP distribution is mediated by phosphatidylinositol 3-kinase (see OMIM Ref. No. 171834) and glycogen synthase kinase 3-beta (OMIM Ref. No. 605004). Antibody injections suggested that CLASP2 is required for the orientation of stabilized microtubules toward the leading edge. The authors proposed that CLASPs are involved in the local regulation of microtubule dynamics in response to positional cues.

[16306] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[16307] Akhmanova, A.; Hoogenraad, C. C.; Drabek, K.; Stepanova, T.; Dortland, B.; Verkerk, T.; Vermeulen, W.; Burgering, B. M.; De Zeeuw, C. I.; Grosveld, F.; Galjart, N. : CLASPs are CLIP-115 and -170 associating proteins involved in the regional regulation of microtubule dynamics in motile fibroblasts. Cell 104: 923-935, 2001. ; and

[16309] Further studies establishing the function and utilities of CLASP1 are found in John Hopkins OMIM database record ID 605852, and in cited publications numbered 662 and 9440 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Diacylglycerol O-acyltransferase Homolog 2 (mouse) (DGAT2, Accession NM_032564) is another VGAM298 host target gene. DGAT2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DGAT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of DGAT2 BINDING SITE, designated SEQ ID:26291, to the nucleotide sequence of VGAM298 RNA, herein designated VGAM RNA, also designated SEQ ID:3009.

[16310] Another function of VGAM298 is therefore inhibition of Diacylglycerol O-acyltransferase Homolog 2 (mouse) (DGAT2, Accession NM_032564). Accordingly, utilities of VGAM298 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGAT2. Dmx-like 1 (DMXL1, Accession NM_005509) is another VGAM298 host target gene. DMXL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DMXL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMXL1 BINDING SITE, designated SEQ ID:12025, to the nucleotide sequence of VGAM298 RNA, herein designated VGAM RNA, also designated SEQ ID:3009.

[16311] Another function of VGAM298 is therefore inhibition of Dmx-like 1 (DMXL1, Accession NM_005509). Accordingly, utilities of VGAM298 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DMXL1. Sorting Nexin 9 (SNX9, Accession NM_016224) is another VGAM298 host target gene. SNX9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNX9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNX9 BINDING SITE, designated SEQ ID:18327, to the nucleotide sequence of VGAM298 RNA, herein designated VGAM RNA, also designated SEQ ID:3009.

[16312] Another function of VGAM298 is therefore inhibition of Sorting Nexin 9 (SNX9, Accession NM_016224). Accordingly, utilities of VGAM298 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX9. Unc-5 Homolog B (C. elegans) (UNC5C, Accession NM_003728) is another VGAM298 host target gene. UNC5C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UNC5C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UNC5C BINDING SITE, designated SEQ ID:9818, to the nucleotide sequence of VGAM298 RNA,

herein designated VGAM RNA, also designated SEQ ID:3009.

[16313] Another function of VGAM298 is therefore inhibition of Unc-5 Homolog B (*C. elegans*) (UNC5C, Accession NM_003728), a gene which is a putative receptor for netrin, which is involved in axon guidance. Accordingly, utilities of VGAM298 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC5C. The function of UNC5C has been established by previous studies. Migration of neurons from proliferative zones to their functional sites is fundamental to the normal development of the central nervous system. Mice homozygous for the rostral cerebellar malformation (*rcm*) mutation exhibit cerebellar and midbrain defects, apparently as a result of abnormal neuronal migration. Ackerman et al. (1997) reported that in *rcm*-mutant mice, the cerebellum is smaller and has fewer folia than in wildtype, ectopic cerebellar cells are present in midbrain regions by 3 days after birth, and there are abnormalities in postnatal cerebellar-neuronal migration. The authors isolated cDNAs encoding the *rcm* protein (*Rcm*). Sequence analysis revealed that the predicted 931-amino acid mouse protein is a transmembrane protein that contains 2 im-

munoglobulin (Ig)-like domains and 2 type I thrombospondin (THBS1; 188060) motifs in the extracellular region. Ig and THBS1 domains are also found in the extracellular region of the *C. elegans* UNC5 transmembrane protein, and the C-terminal 865-amino acid region of Rcm is 30% identical to UNC5. Ackerman et al. (1997) stated that the UNC5 protein is essential for dorsal guidance of pioneer axons and for the movement of cells away from the netrin ligand. In the developing brain of vertebrates, netrin-1 (OMIM Ref. No. 601614) plays a role in both cell migration and axonal guidance. Leonardo et al. (1997) demonstrated that Rcm binds netrin-1 in vitro. Ackerman et al. (1997) concluded that Rcm and its ligand are important in critical migratory and/or cell-proliferation events during cerebellar development. Przyborski et al. (1998) found that disruption of the mouse rcm gene, also called the Unc5h3 gene, resulted in a failure of tangentially migrating granule cells to recognize the rostral boundary of the cerebellum. By searching an EST database for sequences related to the Unc5h3 gene, Ackerman and Knowles (1998) identified a partial human fetal brain cDNA encoding UNC5C, the human Unc5h3 homolog. Using 5-prime RACE, they cloned a cDNA corre-

sponding to the entire UNC5C coding region. The predicted 931-amino acid human protein has the overall domain structure of UNC5 family proteins, and is 97% identical to Unc5h3. Northern blot analysis revealed that the 9.5-kb UNC5 mRNA is expressed in brain and heart, and at low levels in kidney.

[16314] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16315] Przyborski, S. A.; Knowles, B. B.; Ackerman, S. L. : Embryonic phenotype of Unc5h3 mutant mice suggests chemorepulsion during the formation of the rostral cerebellar boundary. *Development* 125: 41–50, 1998. ; and

[16316] Ackerman, S. L.; Knowles, B. B. : Cloning and mapping of the UNC5C gene to human chromosome 4q21–q23. *Genomics* 52: 205–208, 1998.

[16317] Further studies establishing the function and utilities of UNC5C are found in John Hopkins OMIM database record ID 603610, and in cited publications numbered 2885–2889 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. UV Radiation Resistance Associated Gene (UVRAG, Accession NM_003369) is another VGAM298 host target gene.

UVRAG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UVRAG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UVRAG BINDING SITE, designated SEQ ID:9396, to the nucleotide sequence of VGAM298 RNA, herein designated VGAM RNA, also designated SEQ ID:3009.

[16318] Another function of VGAM298 is therefore inhibition of UV Radiation Resistance Associated Gene (UVRAG, Accession NM_003369). Accordingly, utilities of VGAM298 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UVRAG. FLJ10097 (Accession XM_043653) is another VGAM298 host target gene. FLJ10097 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10097, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10097 BINDING SITE, designated SEQ ID:33990, to the nucleotide sequence of VGAM298 RNA, herein designated VGAM RNA, also designated SEQ

ID:3009.

[16319] Another function of VGAM298 is therefore inhibition of FLJ10097 (Accession XM_043653). Accordingly, utilities of VGAM298 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10097. FLJ23416 (Accession NM_032238) is another VGAM298 host target gene. FLJ23416 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23416 BINDING SITE, designated SEQ ID:25959, to the nucleotide sequence of VGAM298 RNA, herein designated VGAM RNA, also designated SEQ ID:3009.

[16320] Another function of VGAM298 is therefore inhibition of FLJ23416 (Accession NM_032238). Accordingly, utilities of VGAM298 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23416. KIAA1317 (Accession XM_098368) is another VGAM298 host target gene. KIAA1317 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1317 BINDING SITE, designated SEQ ID:41620, to the nucleotide sequence of VGAM298 RNA, herein designated VGAM RNA, also designated SEQ ID:3009.

[16321] Another function of VGAM298 is therefore inhibition of KIAA1317 (Accession XM_098368). Accordingly, utilities of VGAM298 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1317. NYD-SP29 (Accession XM_059085) is another VGAM298 host target gene. NYD-SP29 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NYD-SP29, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NYD-SP29 BINDING SITE, designated SEQ ID:36861, to the nucleotide sequence of VGAM298 RNA, herein designated VGAM RNA, also designated SEQ ID:3009.

[16322] Another function of VGAM298 is therefore inhibition of NYD-SP29 (Accession XM_059085). Accordingly, utilities of VGAM298 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NYD-SP29. SSH2 (Accession XM_030846) is another VGAM298 host target gene. SSH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSH2 BINDING SITE, designated SEQ ID:31175, to the nucleotide sequence of VGAM298 RNA, herein designated VGAM RNA, also designated SEQ ID:3009.

[16323] Another function of VGAM298 is therefore inhibition of SSH2 (Accession XM_030846). Accordingly, utilities of VGAM298 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSH2. Fig.

1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 299 (VGAM299) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16324] VGAM299 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM299 was detected is described hereinabove with reference to Figs. 1–8.

[16325] VGAM299 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM299 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16326] VGAM299 gene encodes a VGAM299 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM299 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM299 precursor RNA is designated SEQ ID:285, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:285 is

located at position 59096 relative to the genome of Epi-
phyas Postvittana Nucleopolyhedrovirus.

[16327] VGAM299 precursor RNA folds onto itself, forming VGAM299 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16328] An enzyme complex designated DICER COMPLEX, `dices` the VGAM299 folded precursor RNA into VGAM299 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM299 RNA is designated SEQ ID:3010, and is provided hereinbelow with reference to the sequence listing part.

[16329] VGAM299 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM299 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM299 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[16330] VGAM299 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM299 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM299 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM299 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM299 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[16331] The complementary binding of VGAM299 RNA, herein designated VGAM RNA, to host target binding sites on VGAM299 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM299 host target RNA into VGAM299 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16332] It is appreciated that VGAM299 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM299 host target genes. The mRNA of each one of this plurality of VGAM299 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM299 RNA, herein designated VGAM RNA, and which when bound by VGAM299 RNA causes inhibition of translation of respective one or more VGAM299

host target proteins.

[16333] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM299 gene, herein designated VGAM GENE, on one or more VGAM299 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16334] It is yet further appreciated that a function of VGAM299 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucle-

opolyhedrovirus. Specific functions, and accordingly utilities, of VGAM299 correlate with, and may be deduced from, the identity of the host target genes which VGAM299 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16335] Nucleotide sequences of the VGAM299 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM299 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM299 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM299 are further described hereinbelow with reference to Table 1.

[16336] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM299 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM299 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16337] As mentioned hereinabove with reference to Fig. 1, a function of VGAM299 gene, herein designated VGAM is inhibition of expression of VGAM299 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM299 correlate with, and may be deduced from, the identity of the target genes which VGAM299 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16338] Apolipoprotein L, 1 (APOL1, Accession NM_003661) is a VGAM299 host target gene. APOL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APOL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOL1 BINDING SITE, designated SEQ ID:9735, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16339] A function of VGAM299 is therefore inhibition of Apolipoprotein L, 1 (APOL1, Accession NM_003661), a gene which may participate in reverse cholesterol transport from peripheral cells to the liver. Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOL1. The function of APOL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM235.ATP Synthase, H⁺ Transporting, Mitochondrial F1 Complex, Beta Polypeptide (ATP5B, Accession XM_006710) is another VGAM299 host target gene. ATP5B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ATP5B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP5B BINDING SITE, designated SEQ ID:30007, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16340] Another function of VGAM299 is therefore inhibition of ATP Synthase, H⁺ Transporting, Mitochondrial F1 Complex, Beta Polypeptide (ATP5B, Accession XM_006710). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP5B. CAAX Box 1 (CXX1, Accession NM_003928) is another VGAM299 host target gene. CXX1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CXX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

CXX1 BINDING SITE, designated SEQ ID:10026, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16341] Another function of VGAM299 is therefore inhibition of CAAX Box 1 (CXX1, Accession NM_003928). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXX1. 5-hydroxytryptamine (serotonin) Receptor 4 (HTR4, Accession NM_000870) is another VGAM299 host target gene. HTR4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HTR4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTR4 BINDING SITE, designated SEQ ID:6543, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16342] Another function of VGAM299 is therefore inhibition of 5-hydroxytryptamine (serotonin) Receptor 4 (HTR4, Accession NM_000870), a gene which mediates calcium channel currents. Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with HTR4. The function of HTR4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM65. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 8 (PPP1R8, Accession NM_138558) is another VGAM299 host target gene. PPP1R8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PPP1R8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R8 BINDING SITE, designated SEQ ID:28859, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16343] Another function of VGAM299 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 8 (PPP1R8, Accession NM_138558), a gene which is an inhibitor subunit of the major nuclear protein phosphatase-1 (pp-1). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R8. The function of PPP1R8 and its association with various diseases and clin-

ical conditions, has been established by previous studies, as described hereinabove with reference to VGAM101. Transcription Factor 19 (SC1) (TCF19, Accession XM_175167) is another VGAM299 host target gene. TCF19 BINDING SITE1 and TCF19 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TCF19, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF19 BINDING SITE1 and TCF19 BINDING SITE2, designated SEQ ID:46657 and SEQ ID:46706 respectively, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16344] Another function of VGAM299 is therefore inhibition of Transcription Factor 19 (SC1) (TCF19, Accession XM_175167), a gene which plays an important role in the transcription of genes required for the later stages of cell cycle progression. Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF19. The function of TCF19 has been established by previous studies. Ku et al. (1991) cloned a growth-regulated cDNA by differential

screening of a mouse 3T3 cell line library to identify transcripts induced by serum stimulation. Transcripts of the gene, designated SC1, were detectable beginning at about 8 hours after stimulation. The mouse cDNA was used to clone the human SC1 cDNA. The 2.6-kb cDNA encoded a deduced 359-amino acid polypeptide with features characteristic of transactivating factors. The gene was mapped by in situ hybridization to chromosome 6p21-p22. The bacterially expressed protein had the predicted size of 39 kD. Krishnan et al. (1995) mapped TCF19 with POU5F1 (OMIM Ref. No. 164177) to a 0.2-Mb region between HLAC (OMIM Ref. No. 142840) and the so-called S gene (OMIM Ref. No. 602593) at 6p21.3. POU5F1 and TCF19 are about 130 kb telomeric of HLAC and about 600 bp from each other.

[16345] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16346] Krishnan, B. R.; Jamry, I.; Chaplin, D. D. : Feature mapping of the HLA class I region: localization of the POU5F1 and TCF19 genes. *Genomics* 30: 53-58, 1995. ; and

[16347] Ku, D.-H.; Chang, C.; Koniecki, J.; Cannizzaro, L. A.; Boghosian-Sell, L.; Alder, H.; Baserga, R. : A new growth-

regulated complementary DNA with the sequence of a putative trans-activ.

[16348] Further studies establishing the function and utilities of TCF19 are found in John Hopkins OMIM database record ID 600912, and in cited publications numbered 9610–9611 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tumor Necrosis Factor (ligand) Superfamily, Member 5 (hyper-IgM syndrome) (TNFSF5, Accession NM_000074) is another VGAM299 host target gene. TNFSF5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFSF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF5 BINDING SITE, designated SEQ ID:5520, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16349] Another function of VGAM299 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 5 (hyper-IgM syndrome) (TNFSF5, Accession NM_000074). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with TNFSF5. Williams–Beuren Syndrome Chromosome Region 1 (WBSCR1, Accession NM_022170) is another VGAM299 host target gene. WBSCR1 BINDING SITE1 and WBSCR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WBSCR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WBSCR1 BINDING SITE1 and WBSCR1 BINDING SITE2, designated SEQ ID:22726 and SEQ ID:25709 respectively, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16350] Another function of VGAM299 is therefore inhibition of Williams–Beuren Syndrome Chromosome Region 1 (WBSCR1, Accession NM_022170), a gene which stimulates protein translation. Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR1. The function of WBSCR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM110.

Chromosome 7 Open Reading Frame 13

(C7orf13, Accession NM_032625) is another VGAM299 host target gene. C7orf13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C7orf13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C7orf13 BINDING SITE, designated SEQ ID:26341, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16351] Another function of VGAM299 is therefore inhibition of Chromosome 7 Open Reading Frame 13 (C7orf13, Accession NM_032625). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C7orf13. Calcium/calmodulin-dependent Protein Kinase Kinase 2, Beta (CAMKK2, Accession NM_006549) is another VGAM299 host target gene. CAMKK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CAMKK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMKK2 BINDING SITE,

designated SEQ ID:13313, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16352] Another function of VGAM299 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase Kinase 2, Beta (CAMKK2, Accession NM_006549). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK2. DKFZP434K1772 (Accession XM_041936) is another VGAM299 host target gene. DKFZP434K1772 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434K1772, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434K1772 BINDING SITE, designated SEQ ID:33635, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16353] Another function of VGAM299 is therefore inhibition of DKFZP434K1772 (Accession XM_041936). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZP434K1772. FLJ11850 (Accession NM_022741) is another VGAM299 host target gene. FLJ11850 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11850, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11850 BINDING SITE, designated SEQ ID:22952, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16354] Another function of VGAM299 is therefore inhibition of FLJ11850 (Accession NM_022741). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11850. FLJ12934 (Accession NM_022899) is another VGAM299 host target gene. FLJ12934 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12934 BINDING SITE, designated SEQ ID:23179, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3010.

[16355] Another function of VGAM299 is therefore inhibition of FLJ12934 (Accession NM_022899). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12934. FLJ22795 (Accession NM_025084) is another VGAM299 host target gene. FLJ22795 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22795, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22795 BINDING SITE, designated SEQ ID:24691, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16356] Another function of VGAM299 is therefore inhibition of FLJ22795 (Accession NM_025084). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22795. Interleukin 14 (IL14, Accession XM_170924) is another VGAM299 host target gene. IL14 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IL14, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL14 BINDING SITE, designated SEQ ID:45705, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16357] Another function of VGAM299 is therefore inhibition of Interleukin 14 (IL14, Accession XM_170924). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL14. KIAA0161 (Accession NM_014746) is another VGAM299 host target gene. KIAA0161 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0161 BINDING SITE, designated SEQ ID:16434, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16358] Another function of VGAM299 is therefore inhibition of KIAA0161 (Accession NM_014746). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0161. KIAA0240 (Accession XM_166479) is another VGAM299 host target gene. KIAA0240 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0240, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0240 BINDING SITE, designated SEQ ID:44408, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16359] Another function of VGAM299 is therefore inhibition of KIAA0240 (Accession XM_166479). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0240. KIAA1340 (Accession XM_044836) is another VGAM299 host target gene. KIAA1340 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1340 BINDING SITE, designated SEQ ID:34300, to the

nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16360] Another function of VGAM299 is therefore inhibition of KIAA1340 (Accession XM_044836). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1340. KIAA1872 (Accession XM_031917) is another VGAM299 host target gene. KIAA1872 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1872, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1872 BINDING SITE, designated SEQ ID:31521, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16361] Another function of VGAM299 is therefore inhibition of KIAA1872 (Accession XM_031917). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1872. MGC4170 (Accession NM_024312) is another VGAM299 host target gene. MGC4170 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by MGC4170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4170 BINDING SITE, designated SEQ ID:23606, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16362] Another function of VGAM299 is therefore inhibition of MGC4170 (Accession NM_024312). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4170. Ring Finger Protein 40 (RNF40, Accession NM_014771) is another VGAM299 host target gene. RNF40 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF40, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF40 BINDING SITE, designated SEQ ID:16569, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16363] Another function of VGAM299 is therefore inhibition of

Ring Finger Protein 40 (RNF40, Accession NM_014771). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF40. Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM_004863) is another VGAM299 host target gene. SPTLC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPTLC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPTLC2 BINDING SITE, designated SEQ ID:11287, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16364] Another function of VGAM299 is therefore inhibition of Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM_004863). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPTLC2. Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession XM_053740) is another VGAM299 host target gene. TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2 are HOST TARGET binding sites found in untrans-

lated regions of mRNA encoded by TP53INP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2, designated SEQ ID:36121 and SEQ ID:27112 respectively, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16365] Another function of VGAM299 is therefore inhibition of Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession XM_053740). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53INP1.

LOC145717 (Accession XM_039771) is another VGAM299 host target gene. LOC145717 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145717, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145717 BINDING SITE, designated SEQ ID:33193, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16366] Another function of VGAM299 is therefore inhibition of LOC145717 (Accession XM_039771). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145717. LOC146488 (Accession XM_047748) is another VGAM299 host target gene. LOC146488 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146488, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146488 BINDING SITE, designated SEQ ID:35041, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16367] Another function of VGAM299 is therefore inhibition of LOC146488 (Accession XM_047748). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146488. LOC148089 (Accession XM_086040) is another VGAM299 host target gene. LOC148089 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148089, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148089 BINDING SITE, designated SEQ ID:38453, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16368] Another function of VGAM299 is therefore inhibition of LOC148089 (Accession XM_086040). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148089. LOC200772 (Accession XM_117275) is another VGAM299 host target gene. LOC200772 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200772, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200772 BINDING SITE, designated SEQ ID:43347, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16369] Another function of VGAM299 is therefore inhibition of LOC200772 (Accession XM_117275). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC200772. LOC220537 (Accession XM_165406) is another VGAM299 host target gene. LOC220537 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220537, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220537 BINDING SITE, designated SEQ ID:43624, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16370] Another function of VGAM299 is therefore inhibition of LOC220537 (Accession XM_165406). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220537. LOC221882 (Accession XM_166507) is another VGAM299 host target gene. LOC221882 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221882, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221882 BINDING SITE, designated SEQ ID:44435, to the nucleotide sequence of VGAM299 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3010.

[16371] Another function of VGAM299 is therefore inhibition of LOC221882 (Accession XM_166507). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221882. LOC253675 (Accession XM_172990) is another VGAM299 host target gene. LOC253675 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253675, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253675 BINDING SITE, designated SEQ ID:46266, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16372] Another function of VGAM299 is therefore inhibition of LOC253675 (Accession XM_172990). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253675. LOC54466 (Accession NM_019003) is another VGAM299 host target gene. LOC54466 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC54466, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC54466 BINDING SITE, designated SEQ ID:21076, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:3010.

[16373] Another function of VGAM299 is therefore inhibition of LOC54466 (Accession NM_019003). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC54466. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 300 (VGAM300) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16374] VGAM300 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM300 was detected is described hereinabove with reference to Figs. 1–8.

[16375] VGAM300 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana

Nucleopolyhedrovirus. VGAM300 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16376] VGAM300 gene encodes a VGAM300 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM300 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM300 precursor RNA is designated SEQ ID:286, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:286 is located at position 99030 relative to the genome of Epiphyas Postvittana Nucleopolyhedrovirus.

[16377] VGAM300 precursor RNA folds onto itself, forming VGAM300 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16378] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM300 folded precursor RNA into VGAM300 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM300 RNA is designated SEQ ID:3011, and is provided hereinbelow with reference to the sequence listing part.

[16379] VGAM300 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM300 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM300 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[16380] VGAM300 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM300 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM300 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM300 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM300 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16381] The complementary binding of VGAM300 RNA, herein designated VGAM RNA, to host target binding sites on VGAM300 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM300 host target RNA into VGAM300 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16382] It is appreciated that VGAM300 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM300 host target genes. The mRNA of each one of this plurality of VGAM300 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM300 RNA, herein designated VGAM RNA, and which when bound by VGAM300 RNA causes inhibition of translation of respective one or more VGAM300 host target proteins.

[16383] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM300 gene, herein designated VGAM GENE, on one or more VGAM300 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16384] It is yet further appreciated that a function of VGAM300 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM300 correlate with, and may be deduced from, the identity of the host target genes which VGAM300 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16385] Nucleotide sequences of the VGAM300 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM300 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM300 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM300 are further described hereinbelow with reference to Table 1.

- [16386] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM300 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM300 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [16387] As mentioned hereinabove with reference to Fig. 1, a function of VGAM300 gene, herein designated VGAM is inhibition of expression of VGAM300 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM300 correlate with, and may be deduced from, the identity of the target genes which VGAM300 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [16388] Excision Repair Cross-complementing Rodent Repair Deficiency, Complementation Group 5 (xeroderma pigmentosum, complementation group G (Cockayne syndrome)) (ERCC5, Accession NM_000123) is a VGAM300 host target gene. ERCC5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ERCC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of ERCC5 BINDING SITE, designated SEQ ID:5596, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:3011.

[16389] A function of VGAM300 is therefore inhibition of Excision Repair Cross-complementing Rodent Repair Deficiency, Complementation Group 5 (xeroderma pigmentosum, complementation group G (Cockayne syndrome)) (ERCC5, Accession NM_000123), a gene which single-stranded dna endonuclease involved in dna excision repair. Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERCC5. The function of ERCC5 has been established by previous studies. Hori et al. (1983) found that human chromosome 13 is involved in excision repair of UV-induced DNA damage. This was shown by studying somatic cell hybrids between a UV-sensitive mutant mouse cell line and normal human lymphocytes. The mouse line used had a defect that fell into complementation group I (of OMIM Ref. No. 278700). Siciliano (1987) found that UV-135 is the same as ERCM2; complementation of the two cell lines was not observed. Furthermore, ERCM2 is

the same as ERCC5. Previously, 2 patients with a rare combined xeroderma pigmentosum/Cockayne syndrome phenotype were identified: one within XP complementation group B (OMIM Ref. No. 133540) and one within complementation group D (OMIM Ref. No. 126340). Vermeulen et al. (1993) reported genetic studies of 2 unrelated, severely affected patients with clinical characteristics of Cockayne syndrome but with a biochemical defect typical of xeroderma pigmentosum. By complementation analysis, using somatic cell fusion and nuclear microinjection of cloned repair genes, they assigned these 2 patients to XP complementation group G. Volker et al. (2001) described the assembly of the NER complex in normal and repair-deficient (xeroderma pigmentosum) human cells by employing a novel technique of local ultraviolet irradiation combined with fluorescent antibody labeling. The damage-recognition complex XPC (OMIM Ref. No. 278720)–HR23B (OMIM Ref. No. 600062) appeared to be essential for the recruitment of all subsequent NER factors in the preincision complex, including transcription repair factor TFIIH. The authors found that XPA associates relatively late, is required for anchoring of ERCC1–XPF, and may be essential for activation of the endonuclease activ-

ity of XPG. These findings identified XPC as the earliest known NER factor in the reaction mechanism, gave insight into the order of subsequent NER components, provided evidence for a dual role of XPA, and supported a concept of sequential assembly of repair proteins at the site of damage rather than a preassembled repairosome.

[16390] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16391] Hori, T.; Shiomi, T.; Sato, K. : Human chromosome 13 compensates a DNA repair defect in UV-sensitive mouse cells by mouse-human cell hybridization. Proc. Nat. Acad. Sci. 80: 5655-5659, 1983. ; and

[16392] Volker, M.; Mone, M. J.; Karmakar, P.; van Hoffen, A.; Schul, W.; Vermeulen, W.; Hoeijmakers, J. H. J.; van Driel, R.; van Zeeland, A. A.; Mullenders, L. H. F. : Sequential assembly of.

[16393] Further studies establishing the function and utilities of ERCC5 are found in John Hopkins OMIM database record ID 133530, and in cited publications numbered 3101, 11354-11355, 3102, 11356-11369, 11369-11373, 1875-1876, 3690, 369 and 3671-1880 listed in the bibliography section hereinbelow, which are also hereby incor-

porated by reference. Interleukin 8 Receptor, Alpha (IL8RA, Accession NM_000634) is another VGAM300 host target gene. IL8RA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL8RA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL8RA BINDING SITE, designated SEQ ID:6268, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:3011.

[16394] Another function of VGAM300 is therefore inhibition of Interleukin 8 Receptor, Alpha (IL8RA, Accession NM_000634), a gene which is the receptor to interleukin-8, which is a powerful neutrophils chemotactic factor. Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL8RA. The function of IL8RA has been established by previous studies. Interleukin-8 (IL8; 146930) is a member of a family of pro-inflammatory cytokines. The best-characterized activities of IL8 include the chemoattraction and activation of neutrophils. Holmes et al. (1991) isolated a cDNA encoding an IL8 receptor from human neutrophils. The deduced amino acid sequence

showed that the receptor is a member of the superfamily of receptors that couple to guanine nucleotide binding proteins (G proteins). The sequence is 29% identical to that of receptors for the other neutrophil chemoattractants, fMet-Leu-Phe and C5a. Morris et al. (1992) mapped the type 1 interleukin-8 receptor gene to 2q35; see type 2 interleukin-8 receptor (OMIM Ref. No. 146928) for further information on the two IL8R genes. Mollereau et al. (1993) assigned the high-affinity receptor gene to the same region by in situ hybridization. Lloyd et al. (1993) assigned both the IL8RA and the IL8RB gene to chromosome 2 by polymerase chain reaction amplification and by Southern analysis of a panel of human/rodent somatic cell hybrid DNAs. The IL8R genes were further localized by in situ hybridization to 2q35. Palter et al. (2001) characterized the IL8 system, which includes IL8, its receptors IL8RA and IL8RB, and its degradative enzyme aminopeptidase N (OMIM Ref. No. 151530), in the human fallopian tube by immunohistochemistry. IL8 was found in the human fallopian tube predominantly in the epithelial cells and was present in greater amounts in the distal compared with the proximal tube. IL8RA and IL8RB localized in the tube in similar patterns. Aminopeptidase N was found in tubal

stromal tissue at the epithelial–stromal border and perivascularly. The authors concluded that the IL8 system may be an active component of tubal physiology and that aminopeptidase N may limit the systemic effects of epithelial IL8.

[16395] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16396] Morris, S. W.; Nelson, N.; Valentine, M. B.; Shapiro, D. N.; Look, A. T.; Kozlosky, C. J.; Beckmann, M. P.; Cerretti, D. P. : Assignment of the genes encoding human interleukin–8 receptor types 1 and 2 and an interleukin–8 receptor pseudogene to chromosome 2q35. *Genomics* 14: 685–691, 1992. ; and

[16397] Palter, S. F.; Mulayim, N.; Senturk, L.; Arici, A. : Interleukin–8 in the human fallopian tube. *J. Clin. Endocr. Metab.* 86: 2660–2667, 2001.

[16398] Further studies establishing the function and utilities of IL8RA are found in John Hopkins OMIM database record ID 146929, and in cited publications numbered 391 and 295–297 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Laminin, Alpha 4 (LAMA4, Accession NM_002290) is another

VGAM300 host target gene. LAMA4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LAMA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAMA4 BINDING SITE, designated SEQ ID:8071, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:3011.

[16399] Another function of VGAM300 is therefore inhibition of Laminin, Alpha 4 (LAMA4, Accession NM_002290), a gene which mediates the attachment, migration and organization of cells into tissues. Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAMA4. The function of LAMA4 has been established by previous studies. Laminin, a multidomain glycoprotein, is the major noncollagenous constituent of basement membranes. It is composed of 3 nonidentical chains: A (OMIM Ref. No. 150320), B1 (OMIM Ref. No. 150240), and B2 (OMIM Ref. No. 150290). The laminins form a cruciform structure consisting of 3 short arms, each of which is formed from different chains, and a long arm composed of all 3 chains.

By screening a human keratinocyte cDNA library for type VII collagen sequences, Richards et al. (1994) isolated a new laminin alpha chain variant gene, LAMA4 (formerly called LAMA3). Northern blot analysis indicated that a cDNA encoding LAMA4 hybridized to a 6.45-kb mRNA, significantly smaller than the 9.5- to 10-kb mRNA of laminin A (Haaparanta et al., 1991). Using PCR on genomic DNA, flow-sorted chromosomes, and fluorescence in situ hybridization, Richards et al. (1994) localized the LAMA4 gene to human chromosome 6q21. In this abstract, the authors referred to the gene as LAMA3; in the related article, Richards et al. (1994) used the corrected symbol, LAMA4. Iivanainen et al. (1995) cloned the laminin alpha-4 cDNA by screening a fetal lung library with a PCR product generated from primers based on a partial laminin-like sequence reported by GenBank. The complete cDNA is approximately 6.2 kb long and encodes a predicted protein of 1,816 amino acids. The domain structure of the protein is similar to the alpha-3 chain (LAMA3, also called BM600), both of which resemble truncated versions of alpha-1 and alpha-2 in which approximately 1,200 residues at the amino end have been lost. Northern blots showed strong expression of the mRNA in

adult heart, lung, ovary, small and large intestines, liver, and placenta.

[16400] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16401] Iivanainen, A.; Sainio, K.; Sariola, H.; Tryggvason, K. : Primary structure and expression of a novel human laminin alpha-4 chain. FEBS Lett. 365: 183-188, 1995. ; and

[16402] Richards, A. J.; Al-Imara, L.; Carter, N. P.; Lloyd, J. C.; Leversha, M. A.; Pope, F. M. : Localization of the gene (LAMA4) to chromosome 6q21 and isolation of a partial cDNA encoding a.

[16403] Further studies establishing the function and utilities of LAMA4 are found in John Hopkins OMIM database record ID 600133, and in cited publications numbered 4368-1586 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Prothymosin, Alpha (gene sequence 28) (PTMA, Accession NM_002823) is another VGAM300 host target gene. PTMA BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PTMA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of PTMA BINDING SITE, designated SEQ ID:8693, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:3011.

[16404] Another function of VGAM300 is therefore inhibition of Prothymosin, Alpha (gene sequence 28) (PTMA, Accession NM_002823), a gene which may mediate immune function by conferring resistance to certain opportunistic infections. Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTMA. The function of PTMA has been established by previous studies. The thymus gland produces several hormones or hormone-like substances which are derived from a polypeptide precursor containing (in the rat) 113 amino acids and known as prothymosin-alpha. A peptide containing 28 amino acid residues, named thymosin-alpha-1, was originally isolated from calf thymosin fraction 5 and shown to restore various aspects of immune function in several in vitro and in vivo test systems. Thymosin-alpha-1 was subsequently isolated from a similar fraction from human thymosin and reported to have the same amino acid sequence as bovine thymosin-alpha-1. Haritos et al. (1984) isolated from fresh rat thymus

a larger polypeptide named prothymosin- α , which contains the thymosin- α -1 sequence at its NH₂ terminus. Prothymosin- α has also been isolated from human thymus. Goodall et al. (1986) constructed a cDNA library from human spleen mRNA and screened for clones containing cDNAs coding for prothymosin- α . Eschenfeldt and Berger (1986) identified cDNA clones for human prothymosin- α in cDNA libraries from staphylococcal endotoxin A-stimulated normal human lymphocytes. The encoded protein was found to be highly acidic (54 residues out of 111) and shared over 90% sequence homology with rat prothymosin- α . The peptide hormone thymosin- α -1 appeared at positions 2-29 of the prothymosin- α amino acid sequence. Manrow et al. (1992) concluded that of the 6 members of the prothymosin- α gene family that have been cloned and sequenced, only one is functional. Szabo et al. (1993) isolated a genomic clone encoding PTMA and subcloned and sequenced the 5-prime regulatory region. They used the 5-prime flanking cloned probe to localize the prothymosin gene to human chromosome 2 by Southern analysis of somatic cell hybrids.

[16405] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [16406] Haritos, A. A.; Goodall, G. J.; Horecker, B. L. : Prothymosin alpha: isolation and properties of the major immunoreactive form of thymosin alpha-1 in rat thymus. Proc. Nat. Acad. Sci. 81: 1008-1011, 1984. ; and
- [16407] Manrow, R. E.; Leone, A.; Krug, M. S.; Eschenfeldt, W. H.; Berger, S. L. : The human prothymosin alpha gene family contains several processed pseudogenes lacking deleterious lesions. Ge.
- [16408] Further studies establishing the function and utilities of PTMA are found in John Hopkins OMIM database record ID 188390, and in cited publications numbered 5697-5701 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM_030668) is another VGAM300 host target gene. PTPRO BINDING SITE1 through PTPRO BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRO, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRO BINDING SITE1

through PTPRO BINDING SITE3, designated SEQ ID:25011, SEQ ID:25020 and SEQ ID:25030 respectively, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:3011.

[16409] Another function of VGAM300 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM_030668), a gene which may function as a cell contact receptor that mediates and controls cell-cell signals. Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRO. The function of PTPRO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM140.C1q and Tumor Necrosis Factor Related Protein 4 (C1QTNF4, Accession NM_031909) is another VGAM300 host target gene. C1QTNF4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C1QTNF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QTNF4 BINDING SITE, designated SEQ ID:25654, to the nucleotide sequence of VGAM300

RNA, herein designated VGAM RNA, also designated SEQ ID:3011.

[16410] Another function of VGAM300 is therefore inhibition of C1q and Tumor Necrosis Factor Related Protein 4 (C1QTNF4, Accession NM_031909). Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QTNF4. Cell Division Cycle Associated 4 (CDCA4, Accession NM_017955) is another VGAM300 host target gene. CDCA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDCA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDCA4 BINDING SITE, designated SEQ ID:19663, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:3011.

[16411] Another function of VGAM300 is therefore inhibition of Cell Division Cycle Associated 4 (CDCA4, Accession NM_017955). Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDCA4. KIAA0876

(Accession XM_035625) is another VGAM300 host target gene. KIAA0876 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0876, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0876 BINDING SITE, designated SEQ ID:32296, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:3011.

[16412] Another function of VGAM300 is therefore inhibition of KIAA0876 (Accession XM_035625). Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0876. KIAA1257 (Accession XM_031577) is another VGAM300 host target gene. KIAA1257 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1257, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1257 BINDING SITE, designated SEQ ID:31433, to the nucleotide sequence of VGAM300 RNA, herein designated

VGAM RNA, also designated SEQ ID:3011.

[16413] Another function of VGAM300 is therefore inhibition of KIAA1257 (Accession XM_031577). Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1257. Kelch-like 6 (Drosophila) (KLHL6, Accession NM_130446) is another VGAM300 host target gene. KLHL6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL6 BINDING SITE, designated SEQ ID:28210, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:3011.

[16414] Another function of VGAM300 is therefore inhibition of Kelch-like 6 (Drosophila) (KLHL6, Accession NM_130446). Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL6. MAD4 (Accession NM_006454) is another VGAM300 host target gene. MAD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by MAD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAD4 BINDING SITE, designated SEQ ID:13172, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:3011.

[16415] Another function of VGAM300 is therefore inhibition of MAD4 (Accession NM_006454). Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAD4. MGC13007 (Accession NM_032320) is another VGAM300 host target gene. MGC13007 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC13007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13007 BINDING SITE, designated SEQ ID:26121, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:3011.

[16416] Another function of VGAM300 is therefore inhibition of MGC13007 (Accession NM_032320). Accordingly, utilities

of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13007. MGC13251 (Accession NM_032714) is another VGAM300 host target gene. MGC13251 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13251 BINDING SITE, designated SEQ ID:26435, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:3011.

[16417] Another function of VGAM300 is therefore inhibition of MGC13251 (Accession NM_032714). Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13251. Mitochondrial Ribosomal Protein L20 (MRPL20, Accession NM_017971) is another VGAM300 host target gene. MRPL20 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPL20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of MRPL20 BINDING SITE, designated SEQ ID:19700, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:3011.

[16418] Another function of VGAM300 is therefore inhibition of Mitochondrial Ribosomal Protein L20 (MRPL20, Accession NM_017971). Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL20. PHACS (Accession NM_032592) is another VGAM300 host target gene. PHACS BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PHACS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHACS BINDING SITE, designated SEQ ID:26324, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:3011.

[16419] Another function of VGAM300 is therefore inhibition of PHACS (Accession NM_032592). Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHACS.

Protein Kinase, Lysine Deficient 2 (PRKWNK2, Accession XM_117531) is another VGAM300 host target gene. PRKWNK2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRKWNK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKWNK2 BINDING SITE, designated SEQ ID:43521, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:3011.

[16420] Another function of VGAM300 is therefore inhibition of Protein Kinase, Lysine Deficient 2 (PRKWNK2, Accession XM_117531). Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKWNK2. SEC14-like 1 (*S. cerevisiae*) (SEC14L1, Accession NM_003003) is another VGAM300 host target gene. SEC14L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEC14L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC14L1

BINDING SITE, designated SEQ ID:8906, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:3011.

[16421] Another function of VGAM300 is therefore inhibition of SEC14-like 1 (*S. cerevisiae*) (SEC14L1, Accession NM_003003). Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC14L1. SEC8 (Accession NM_021807) is another VGAM300 host target gene. SEC8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEC8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC8 BINDING SITE, designated SEQ ID:22361, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:3011.

[16422] Another function of VGAM300 is therefore inhibition of SEC8 (Accession NM_021807). Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC8. Zinc Finger, DHHC Domain Containing 2 (ZDHHC2, Accession NM_016353) is another VGAM300 host target gene. ZD-

HHC2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZDHHC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZDHHC2 BINDING SITE, designated SEQ ID:18487, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:3011.

[16423] Another function of VGAM300 is therefore inhibition of Zinc Finger, DHHC Domain Containing 2 (ZDHHC2, Accession NM_016353). Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC2. LOC145123 (Accession XM_041473) is another VGAM300 host target gene. LOC145123 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145123 BINDING SITE, designated SEQ ID:33534, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3011.

[16424] Another function of VGAM300 is therefore inhibition of LOC145123 (Accession XM_041473). Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145123. LOC147229 (Accession XM_085742) is another VGAM300 host target gene. LOC147229 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147229 BINDING SITE, designated SEQ ID:38316, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:3011.

[16425] Another function of VGAM300 is therefore inhibition of LOC147229 (Accession XM_085742). Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147229. LOC151009 (Accession XM_097992) is another VGAM300 host target gene. LOC151009 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151009, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151009 BINDING SITE, designated SEQ ID:41291, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:3011.

[16426] Another function of VGAM300 is therefore inhibition of LOC151009 (Accession XM_097992). Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151009. LOC220058 (Accession XM_166258) is another VGAM300 host target gene. LOC220058 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220058, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220058 BINDING SITE, designated SEQ ID:44083, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:3011.

[16427] Another function of VGAM300 is therefore inhibition of LOC220058 (Accession XM_166258). Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC220058. LOC254892 (Accession XM_170951) is another VGAM300 host target gene. LOC254892 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254892, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254892 BINDING SITE, designated SEQ ID:45737, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:3011.

[16428] Another function of VGAM300 is therefore inhibition of LOC254892 (Accession XM_170951). Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254892. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 301 (VGAM301) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16429] VGAM301 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM301 was detected is described hereinabove with reference to Figs. 1–8.

[16430] VGAM301 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM301 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16431] VGAM301 gene encodes a VGAM301 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM301 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM301 precursor RNA is designated SEQ ID:287, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:287 is located at position 49379 relative to the genome of Epiphyas Postvittana Nucleopolyhedrovirus.

[16432] VGAM301 precursor RNA folds onto itself, forming VGAM301 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16433] An enzyme complex designated DICER COMPLEX, `dices` the VGAM301 folded precursor RNA into VGAM301 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM301 RNA is designated SEQ ID:3012, and is provided hereinbelow with reference to the sequence listing part.

[16434] VGAM301 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM301 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM301 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[16435] VGAM301 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM301 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM301 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM301 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM301 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16436] The complementary binding of VGAM301 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM301 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM301 host target RNA into VGAM301 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16437] It is appreciated that VGAM301 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM301 host target genes. The mRNA of each one of this plurality of VGAM301 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM301 RNA, herein designated VGAM RNA, and which when bound by VGAM301 RNA causes inhibition of translation of respective one or more VGAM301 host target proteins.

[16438] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM301 gene, herein designated VGAM GENE, on one or more VGAM301 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16439] It is yet further appreciated that a function of VGAM301 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM301 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM301 correlate with, and may be deduced from, the identity of the host target genes which VGAM301 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16440] Nucleotide sequences of the VGAM301 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

5' duced 5' VGAM301 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM301 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM301 are further described hereinbelow with reference to Table 1.

[16441] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM301 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM301 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16442] As mentioned hereinabove with reference to Fig. 1, a function of VGAM301 gene, herein designated VGAM is inhibition of expression of VGAM301 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM301 correlate with, and may be deduced from, the identity of the target genes which VGAM301 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16443] FLJ14686 (Accession NM_032825) is a VGAM301 host target gene. FLJ14686 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by FLJ14686, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14686 BINDING SITE, designated SEQ ID:26599, to the nucleotide sequence of VGAM301 RNA, herein designated VGAM RNA, also designated SEQ ID:3012.

[16444] A function of VGAM301 is therefore inhibition of FLJ14686 (Accession NM_032825). Accordingly, utilities of VGAM301 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14686. HTMP10 (Accession NM_033207) is another VGAM301 host target gene. HTMP10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HTMP10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTMP10 BINDING SITE, designated SEQ ID:27050, to the nucleotide sequence of VGAM301 RNA, herein designated VGAM RNA, also designated SEQ ID:3012.

[16445] Another function of VGAM301 is therefore inhibition of HTMP10 (Accession NM_033207). Accordingly, utilities of

VGAM301 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTMP10. SEC14-like 1 (*S. cerevisiae*) (SEC14L1, Accession NM_003003) is another VGAM301 host target gene. SEC14L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEC14L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC14L1 BINDING SITE, designated SEQ ID:8900, to the nucleotide sequence of VGAM301 RNA, herein designated VGAM RNA, also designated SEQ ID:3012.

[16446] Another function of VGAM301 is therefore inhibition of SEC14-like 1 (*S. cerevisiae*) (SEC14L1, Accession NM_003003). Accordingly, utilities of VGAM301 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC14L1. LOC153688 (Accession XM_098416) is another VGAM301 host target gene. LOC153688 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153688, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153688 BINDING SITE, designated SEQ ID:41654, to the nucleotide sequence of VGAM301 RNA, herein designated VGAM RNA, also designated SEQ ID:3012.

[16447] Another function of VGAM301 is therefore inhibition of LOC153688 (Accession XM_098416). Accordingly, utilities of VGAM301 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153688. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 302 (VGAM302) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16448] VGAM302 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM302 was detected is described hereinabove with reference to Figs. 1-8.

[16449] VGAM302 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM302 host target gene, herein

designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16450] VGAM302 gene encodes a VGAM302 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM302 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM302 precursor RNA is designated SEQ ID:288, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:288 is located at position 66246 relative to the genome of Epi-phyas Postvittana Nucleopolyhedrovirus.

[16451] VGAM302 precursor RNA folds onto itself, forming VGAM302 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16452] An enzyme complex designated DICER COMPLEX, `dices` the VGAM302 folded precursor RNA into VGAM302 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM302 RNA is designated SEQ ID:3013, and is provided hereinbelow with reference to the sequence listing part.

[16453] VGAM302 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM302 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM302 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[16454] VGAM302 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM302 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM302 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM302 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM302 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16455] The complementary binding of VGAM302 RNA, herein designated VGAM RNA, to host target binding sites on VGAM302 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM302 host target RNA into VGAM302 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[16456] It is appreciated that VGAM302 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM302 host target genes. The mRNA of each one of this plurality of VGAM302 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM302 RNA, herein designated VGAM RNA, and which when bound by VGAM302 RNA causes inhibition of translation of respective one or more VGAM302 host target proteins.

[16457] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM302 gene, herein designated VGAM GENE, on one or more VGAM302 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16458] It is yet further appreciated that a function of VGAM302 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM302 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM302 correlate with, and may be deduced from, the identity of the host target genes which VGAM302 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16459] Nucleotide sequences of the VGAM302 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM302 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM302 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM302 are further described hereinbelow with reference to Table 1.

[16460] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM302 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM302 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16461] As mentioned hereinabove with reference to Fig. 1, a function of VGAM302 gene, herein designated VGAM is inhibition of expression of VGAM302 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM302 correlate with, and may be deduced from, the identity of the target genes which VGAM302 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16462] Cholinergic Receptor, Muscarinic 1 (CHRM1, Accession XM_170669) is a VGAM302 host target gene. CHRM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHRM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHRM1 BINDING SITE, designated SEQ ID:45443, to the nucleotide sequence of VGAM302 RNA, herein designated

VGAM RNA, also designated SEQ ID:3013.

[16463] A function of VGAM302 is therefore inhibition of Cholinergic Receptor, Muscarinic 1 (CHRM1, Accession XM_170669), a gene which mediates various cellular responses. Accordingly, utilities of VGAM302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRM1. The function of CHRM1 has been established by previous studies. Goyal (1989) stated that 5 distinct but related muscarinic receptors had been identified, with apparent molecular weights ranging from 51,452 to 66,127. These glycosylated proteins have single chains of 460 to 590 amino acids that are thought to span the plasma membrane 7 times, creating 4 extracellular domains, 7 helical hydrophobic transmembrane domains, and 4 intracellular domains. Each protein is the product of a different gene without introns in the coding sequence, and the amino acid sequences in the receptor subtypes are remarkably homologous among different animal species (Bonner et al., 1987; Peralta et al., 1987; Bonner et al., 1988; Liao et al., 1989). The nomenclature is confusing (Eglen and Whiting, 1986; Goyal, 1989). In structure and evolution, muscarinic receptors are quite distinct from their pharmacologic kin, the nico-

tinic receptors (see OMIM Ref. No. 100690, 100710, 100720, 100730). By means of analysis of somatic cell hybrids and by both isotopic and nonisotopic in situ hybridization, Bonner et al. (1991) assigned the CHRM1 gene to 11q12-q13. Courseaux et al. (1996) used a combination of methods to refine maps of the approximately 5-Mb region of 11q13 that includes MEN1 (OMIM Ref. No. 131100). They proposed the following gene order: cen-

PGA-

FTH1--UGB--AHNAK--ROM1--MDU1--CHRM1--COX8--
EMK1--FKBP2--PLCB3--[PYGM,
ZFM1]--FAU--CAPN1--[MLK3,
RELA]--FOSL1--SEA--CFL1--tel.

[16464] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16465] Bonner, T. I.; Buckley, N. J.; Young, A. C.; Brann, M. R. : Identification of a family of muscarinic acetylcholine receptor genes. Science 237: 527-532, 1987. ; and

[16466] Bonner, T. I.; Modi, W. S.; Seuanez, H. N.; O'Brien, S. J. : Chromosomal mapping of five human genes encoding

muscarinic acetylcholine receptors. (Abstract) Cytogenet. Cell Genet. 58: 1.

[16467] Further studies establishing the function and utilities of CHRM1 are found in John Hopkins OMIM database record ID 118510, and in cited publications numbered 1269 and 3984–3658 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Dishevelled Associated Activator of Morphogenesis 1 (DAAM1, Accession NM_014992) is another VGAM302 host target gene. DAAM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM1 BINDING SITE, designated SEQ ID:17366, to the nucleotide sequence of VGAM302 RNA, herein designated VGAM RNA, also designated SEQ ID:3013.

[16468] Another function of VGAM302 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 1 (DAAM1, Accession NM_014992), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM302 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with DAAM1. The function of DAAM1 has been established by previous studies. By screening size-fractionated brain cDNA libraries for cDNAs with the potential to encode proteins larger than 50 kD, Ishikawa et al. (1998) identified a cDNA which they designated KIAA0666. KIAA0666 encodes a 1,085-amino acid protein predicted to function in cell division. It is 68% identical to the KIAA0381 protein (DAAM2; 606627). RT-PCR analysis detected expression of KIAA0666 in all tissues tested. Wnt (see OMIM Ref. No. 164975) signaling via the frizzled receptor (Fz; OMIM Ref. No. 600667) controls cell polarity and movement during development. Habas et al. (2001) reported that in human cells and during *Xenopus* embryogenesis, Wnt/Fz signaling activates the small GTPase Rho (OMIM Ref. No. 165390), a key regulator of cytoskeleton architecture. Wnt/Fz activation of Rho requires the cytoplasmic protein dishevelled (DVL; OMIM Ref. No. 601365) and a novel formin (see OMIM Ref. No. 136535) homology (FH) protein that they identified and named DAAM1.

DAAM1 is a widely expressed protein that contains 1,078 amino acids and is identical to the KIAA0666 protein. Like other FH proteins, DAAM1 contains a central proline-rich

FH1 domain and a more C-terminal FH2 domain. The authors showed that DAAM1 binds to both DVL and Rho and mediates Wnt-induced DVL-Rho complex formation. Inhibition or depletion of DAAM1 prevented Wnt/Fz activation of Rho and of *Xenopus* gastrulation, but did not prevent activation of beta-catenin (OMIM Ref. No. 116806) signaling.

[16469] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16470] Habas, R.; Kato, Y.; He, X. : Wnt/Frizzled activation of Rho regulates vertebrate gastrulation and requires a novel Formin homology protein Daam1. *Cell* 107: 843–854, 2001. ; and

[16471] Ishikawa, K.; Nagase, T.; Suyama, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. X. The complete sequ.

[16472] Further studies establishing the function and utilities of DAAM1 are found in John Hopkins OMIM database record ID 606626, and in cited publications numbered 452 and 9440 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Inositol

1,4,5-triphosphate Receptor, Type 2 (ITPR2, Accession NM_002223) is another VGAM302 host target gene. ITPR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITPR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPR2 BINDING SITE, designated SEQ ID:7995, to the nucleotide sequence of VGAM302 RNA, herein designated VGAM RNA, also designated SEQ ID:3013.

[16473] Another function of VGAM302 is therefore inhibition of Inositol 1,4,5-triphosphate Receptor, Type 2 (ITPR2, Accession NM_002223). Accordingly, utilities of VGAM302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPR2. Neurocalcin Delta (NCALD, Accession NM_032041) is another VGAM302 host target gene. NCALD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCALD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCALD BINDING SITE, designated SEQ ID:25748, to the nucleotide sequence of

VGAM302 RNA, herein designated VGAM RNA, also designated SEQ ID:3013.

[16474] Another function of VGAM302 is therefore inhibition of Neurocalcin Delta (NCALD, Accession NM_032041). Accordingly, utilities of VGAM302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCALD. Protein Phosphatase 2, Regulatory Subunit B (B56), Epsilon Isoform (PPP2R5E, Accession NM_006246) is another VGAM302 host target gene. PPP2R5E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP2R5E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2R5E BINDING SITE, designated SEQ ID:12924, to the nucleotide sequence of VGAM302 RNA, herein designated VGAM RNA, also designated SEQ ID:3013.

[16475] Another function of VGAM302 is therefore inhibition of Protein Phosphatase 2, Regulatory Subunit B (B56), Epsilon Isoform (PPP2R5E, Accession NM_006246), a gene which is a regulatory subunit of protein phosphatase 2A. Accordingly, utilities of VGAM302 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with PPP2R5E. The function of PPP2R5E has been established by previous studies. is a regulatory subunit of protein phosphatase 2A involving in cellular processes such as cell cycle progression, growth factor signaling, and cell transformation.

[16476] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16477] McCright, B.; Brothman, A. R.; Virshup, D. M. : Assignment of human protein phosphatase 2A regulatory subunit genes B56-alpha, B56-beta, B56-gamma, B56-delta, and B56-epsilon (PPP2R5A--PPP2R5E), highly expressed in muscle and brain, to chromosome regions 1q41, 11q12, 3p21, 6p21.1, and 7p11.2-to-p12. Genomics 36: 168-170, 1996. ; and

[16478] McCright, B.; Rivers, A. M.; Audlin, S.; Virshup, D. M. : The B56 family of protein phosphatase 2A (PP2A) regulatory subunits encodes differentiation-induced phosphoproteins that target.

[16479] Further studies establishing the function and utilities of PPP2R5E are found in John Hopkins OMIM database record ID 601647, and in cited publications numbered 668 and

8305 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ret Finger Protein (RFP, Accession NM_006510) is another VGAM302 host target gene. RFP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RFP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFP BINDING SITE, designated SEQ ID:13263, to the nucleotide sequence of VGAM302 RNA, herein designated VGAM RNA, also designated SEQ ID:3013.

[16480] Another function of VGAM302 is therefore inhibition of Ret Finger Protein (RFP, Accession NM_006510), a gene which involves in transcriptional regulation and may act in male germ cell development . Accordingly, utilities of VGAM302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFP. The function of RFP has been established by previous studies. Ret finger protein (RFP) is a DNA-binding protein associated with the nuclear matrix (Isomura et al., 1992). Szpirer et al. (1997) demonstrated that, although the RFP gene and a gene for an olfactory receptor (OLF89) both map to

chromosome 6 less than 300 kb apart, the mouse homologs are located on 2 different chromosomes, namely 13 and 17, respectively. Thus the 2 genes delineate the breakpoint between 2 of the conserved synteny units on chromosome 6. Unit 1 (or UA) contains the major histocompatibility complex (MHC); unit 2 (or UB) contains the RFP gene. The mouse UA and UB regions are found on chromosome 17 and 13, respectively. The split at the UA/UB breakpoint must have occurred in the rodent lineage, before the mouse radiation, because the rat also shows nonsynteny of RFP and OLF89.

[16481] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16482] Isomura, T.; Tamiya-Koizumi, K.; Suzuki, M.; Yoshida, S.; Taniguchi, M.; Matsuyama, M.; Ishigaki, T.; Sakuma, S.; Takahashi, M. : RFP is a DNA binding protein associated with the nuclear matrix. *Nucleic Acids Res.* 20: 5305-5310, 1992. ; and

[16483] Szpirer, C.; Szpirer, J.; Riviere, M.; Tazi, R.; Pontarotti, P. : Mapping of the Olf89 and Rfp genes to the rat genome: comparison with the mouse and human and new insights into the evo.

[16484] Further studies establishing the function and utilities of RFP are found in John Hopkins OMIM database record ID 602165, and in cited publications numbered 6346–6347 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Slit Homolog 2 (Drosophila) (SLIT2, Accession NM_004787) is another VGAM302 host target gene. SLIT2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLIT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLIT2 BINDING SITE, designated SEQ ID:11192, to the nucleotide sequence of VGAM302 RNA, herein designated VGAM RNA, also designated SEQ ID:3013.

[16485] Another function of VGAM302 is therefore inhibition of Slit Homolog 2 (Drosophila) (SLIT2, Accession NM_004787). Accordingly, utilities of VGAM302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLIT2. Son of Sevenless Homolog 2 (Drosophila) (SOS2, Accession XM_043720) is another VGAM302 host target gene. SOS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by SOS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOS2 BINDING SITE, designated SEQ ID:34001, to the nucleotide sequence of VGAM302 RNA, herein designated VGAM RNA, also designated SEQ ID:3013.

[16486] Another function of VGAM302 is therefore inhibition of Son of Sevenless Homolog 2 (Drosophila) (SOS2, Accession XM_043720). Accordingly, utilities of VGAM302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOS2. Cdc42 Guanine Nucleotide Exchange Factor (GEF) 9 (ARHGEF9, Accession NM_015185) is another VGAM302 host target gene. ARHGEF9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGEF9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF9 BINDING SITE, designated SEQ ID:17543, to the nucleotide sequence of VGAM302 RNA, herein designated VGAM RNA, also designated SEQ ID:3013.

[16487] Another function of VGAM302 is therefore inhibition of Cdc42 Guanine Nucleotide Exchange Factor (GEF) 9 (ARHGEF9, Accession NM_015185). Accordingly, utilities of VGAM302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF9. CIP29 (Accession NM_032364) is another VGAM302 host target gene. CIP29 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CIP29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CIP29 BINDING SITE, designated SEQ ID:26150, to the nucleotide sequence of VGAM302 RNA, herein designated VGAM RNA, also designated SEQ ID:3013.

[16488] Another function of VGAM302 is therefore inhibition of CIP29 (Accession NM_032364). Accordingly, utilities of VGAM302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CIP29. DKFZP434N093 (Accession XM_086948) is another VGAM302 host target gene. DKFZP434N093 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434N093, correspond-

ing to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434N093 BINDING SITE, designated SEQ ID:38993, to the nucleotide sequence of VGAM302 RNA, herein designated VGAM RNA, also designated SEQ ID:3013.

[16489] Another function of VGAM302 is therefore inhibition of DKFZP434N093 (Accession XM_086948). Accordingly, utilities of VGAM302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434N093. Potassium Channel, Subfamily K, Member 13 (KCNK13, Accession NM_022054) is another VGAM302 host target gene. KCNK13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNK13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNK13 BINDING SITE, designated SEQ ID:22593, to the nucleotide sequence of VGAM302 RNA, herein designated VGAM RNA, also designated SEQ ID:3013.

[16490] Another function of VGAM302 is therefore inhibition of Potassium Channel, Subfamily K, Member 13 (KCNK13,

Accession NM_022054). Accordingly, utilities of VGAM302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK13. KIAA0227 (Accession XM_027236) is another VGAM302 host target gene. KIAA0227 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0227, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0227 BINDING SITE, designated SEQ ID:30458, to the nucleotide sequence of VGAM302 RNA, herein designated VGAM RNA, also designated SEQ ID:3013.

[16491] Another function of VGAM302 is therefore inhibition of KIAA0227 (Accession XM_027236). Accordingly, utilities of VGAM302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0227. SENP7 (Accession NM_020654) is another VGAM302 host target gene. SENP7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SENP7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of SENP7 BINDING SITE, designated SEQ ID:21824, to the nucleotide sequence of VGAM302 RNA, herein designated VGAM RNA, also designated SEQ ID:3013.

[16492] Another function of VGAM302 is therefore inhibition of SENP7 (Accession NM_020654). Accordingly, utilities of VGAM302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SENP7. LOC151414 (Accession XM_087197) is another VGAM302 host target gene. LOC151414 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151414, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151414 BINDING SITE, designated SEQ ID:39111, to the nucleotide sequence of VGAM302 RNA, herein designated VGAM RNA, also designated SEQ ID:3013.

[16493] Another function of VGAM302 is therefore inhibition of LOC151414 (Accession XM_087197). Accordingly, utilities of VGAM302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151414. LOC253926 (Accession XM_170741) is an-

other VGAM302 host target gene. LOC253926 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253926, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253926 BINDING SITE, designated SEQ ID:45501, to the nucleotide sequence of VGAM302 RNA, herein designated VGAM RNA, also designated SEQ ID:3013.

[16494] Another function of VGAM302 is therefore inhibition of LOC253926 (Accession XM_170741). Accordingly, utilities of VGAM302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253926. LOC90826 (Accession XM_034321) is another VGAM302 host target gene. LOC90826 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90826 BINDING SITE, designated SEQ ID:32051, to the nucleotide sequence of VGAM302 RNA, herein designated VGAM RNA, also designated SEQ ID:3013.

[16495] Another function of VGAM302 is therefore inhibition of LOC90826 (Accession XM_034321). Accordingly, utilities of VGAM302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90826. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 303 (VGAM303) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16496] VGAM303 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM303 was detected is described hereinabove with reference to Figs. 1–8.

[16497] VGAM303 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Epiphyas Postvittana Nucleopolyhedrovirus. VGAM303 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16498] VGAM303 gene encodes a VGAM303 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM303

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM303 precursor RNA is designated SEQ ID:289, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:289 is located at position 103301 relative to the genome of Epi-phyas Postvittana Nucleopolyhedrovirus.

[16499] VGAM303 precursor RNA folds onto itself, forming VGAM303 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16500] An enzyme complex designated DICER COMPLEX, `dices` the VGAM303 folded precursor RNA into VGAM303 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 42%) nucleotide sequence of VGAM303 RNA is designated SEQ ID:3014, and is provided hereinbelow with reference to the sequence listing part.

[16501] VGAM303 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM303 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM303 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[16502] VGAM303 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM303 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM303 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM303 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM303 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16503] The complementary binding of VGAM303 RNA, herein designated VGAM RNA, to host target binding sites on VGAM303 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM303 host target RNA into VGAM303 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16504] It is appreciated that VGAM303 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM303 host target genes. The mRNA of each one of this plurality of VGAM303 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM303 RNA, herein designated VGAM RNA, and which when bound by VGAM303 RNA causes inhibition of translation of respective one or more VGAM303 host target proteins.

[16505] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM303 gene, herein designated VGAM GENE, on one or more VGAM303 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16506] It is yet further appreciated that a function of VGAM303 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM303 include diagnosis, prevention and treatment of viral infection by Epiphyas Postvittana Nucleopolyhedrovirus. Specific functions, and accordingly utilities, of VGAM303 correlate with, and may be deduced from, the identity of the host target genes which VGAM303 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16507] Nucleotide sequences of the VGAM303 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM303 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM303 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM303 are further described hereinbelow with reference to Table 1.

[16508] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM303 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM303 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[16509] As mentioned hereinabove with reference to Fig. 1, a function of VGAM303 gene, herein designated VGAM is inhibition of expression of VGAM303 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM303 correlate with, and may be deduced from, the identity of the target genes which VGAM303 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16510] FLJ10579 (Accession NM_018145) is a VGAM303 host target gene. FLJ10579 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10579, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10579 BINDING SITE, designated SEQ ID:19942, to the nucleotide sequence of VGAM303 RNA, herein designated VGAM RNA, also designated SEQ ID:3014.

[16511] A function of VGAM303 is therefore inhibition of FLJ10579 (Accession NM_018145). Accordingly, utilities of VGAM303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10579.

Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 304 (VGAM304) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16512] VGAM304 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM304 was detected is described hereinabove with reference to Figs. 1–8.

[16513] VGAM304 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 4. VGAM304 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16514] VGAM304 gene encodes a VGAM304 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM304 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM304 precursor RNA is designated SEQ ID:290, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:290 is

located at position 86184 relative to the genome of Equine Herpesvirus 4.

[16515] VGAM304 precursor RNA folds onto itself, forming VGAM304 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16516] An enzyme complex designated DICER COMPLEX, `dices` the VGAM304 folded precursor RNA into VGAM304 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM304 RNA is designated SEQ ID:3015, and is provided hereinbelow with reference to the sequence listing part.

[16517] VGAM304 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM304 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM304 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[16518] VGAM304 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM304 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM304 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM304 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM304 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[16519] The complementary binding of VGAM304 RNA, herein designated VGAM RNA, to host target binding sites on VGAM304 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM304 host target RNA into VGAM304 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16520] It is appreciated that VGAM304 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM304 host target genes. The mRNA of each one of this plurality of VGAM304 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM304 RNA, herein designated VGAM RNA, and which when bound by VGAM304 RNA causes inhibition of translation of respective one or more VGAM304

host target proteins.

[16521] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM304 gene, herein designated VGAM GENE, on one or more VGAM304 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16522] It is yet further appreciated that a function of VGAM304 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM304 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 4. Spe-

cific functions, and accordingly utilities, of VGAM304 correlate with, and may be deduced from, the identity of the host target genes which VGAM304 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [16523] Nucleotide sequences of the VGAM304 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM304 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM304 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM304 are further described hereinbelow with reference to Table 1.
- [16524] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM304 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM304 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [16525] As mentioned hereinabove with reference to Fig. 1, a function of VGAM304 gene, herein designated VGAM is inhibition of expression of VGAM304 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM304 correlate with, and may be deduced from, the identity of the target genes which VGAM304 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16526] Bone Morphogenetic Protein 6 (BMP6, Accession NM_001718) is a VGAM304 host target gene. BMP6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BMP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BMP6 BINDING SITE, designated SEQ ID:7452, to the nucleotide sequence of VGAM304 RNA, herein designated VGAM RNA, also designated SEQ ID:3015.

[16527] A function of VGAM304 is therefore inhibition of Bone Morphogenetic Protein 6 (BMP6, Accession NM_001718), a gene which induces cartilage and bone formation. Accordingly, utilities of VGAM304 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMP6. The function of BMP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM233.Collagen, Type XV,

Alpha 1 (COL15A1, Accession NM_001855) is another VGAM304 host target gene. COL15A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COL15A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL15A1 BINDING SITE, designated SEQ ID:7590, to the nucleotide sequence of VGAM304 RNA, herein designated VGAM RNA, also designated SEQ ID:3015.

[16528] Another function of VGAM304 is therefore inhibition of Collagen, Type XV, Alpha 1 (COL15A1, Accession NM_001855), a gene which may be involved in maintaining the structure of connective tissue. Accordingly, utilities of VGAM304 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL15A1. The function of COL15A1 has been established by previous studies. Undulin is a large glycoprotein of the interstitial extracellular matrix. It is restricted to dense and soft connective tissues and is associated with mature collagen fibrils (Schuppan et al., 1990). In SDS-polyacrylamide gels, undulin extracted from tissues has a molecular mass above 1,000 kD; under reducing condi-

tions, it migrates as 270-, 190-, and 180-kD polypeptides. By immunoscreening a human placenta cDNA expression library with antibodies against monkey undulin, Just et al. (1991) isolated 2 partial cDNAs, called UN1 and UN2, which encode the C-terminal portions of 2 undulin isoforms. The sequences of UN1 and UN2 are partly identical, and the authors suggested that they represent differentially spliced undulin transcripts. Northern blot analysis of human rhabdomyosarcoma cell poly(A) RNA using a probe specific for UN1 detected approximately 4.2-, 6.5-, and 8.5-kb transcripts; a probe specific for UN2 detected a single, approximately 5-kb transcript. The deduced polypeptides contain a differentially spliced von Willebrand factor (VWF; 193400) A domain and the type III homology domains found in fibronectin (OMIM Ref. No. 135600) and tenascin (OMIM Ref. No. 187380). Whereas UN1 has 7 complete and 1 truncated type III homology domains followed by a short proline-rich C-terminal segment, UN2 has 2 complete and 1 incomplete type III homologies followed by a unique acidic C-terminal domain. The authors stated that the mRNAs related to UN1 likely encode the major chains of the undulin molecule.

[16529] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [16530] Schuppan, D.; Cantaluppi, M. C.; Becker, J.; Veit, A.; Bunte, T.; Troyer, D.; Schuppan, F.; Schmid, M.; Ackermann, R.; Hahn, E. G. : Undulin, an extracellular matrix glycoprotein associated with collagen fibrils. J. Biol. Chem. 265: 8823–8832, 1990. ; and
- [16531] Just, M.; Herbst, H.; Hummel, M.; Durkop, H.; Tripier, D.; Stein, H.; Schuppan, D. : Undulin is a novel member of the fibronectin–tenascin family of extracellular matrix glycoproteins. J.
- [16532] Further studies establishing the function and utilities of COL15A1 are found in John Hopkins OMIM database record ID 120325, and in cited publications numbered 12014–12025 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Paired Box Gene 7 (PAX7, Accession NM_013945) is another VGAM304 host target gene. PAX7 BINDING SITE1 and PAX7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PAX7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se–

quences of PAX7 BINDING SITE1 and PAX7 BINDING SITE2, designated SEQ ID:15133 and SEQ ID:8445 respectively, to the nucleotide sequence of VGAM304 RNA, herein designated VGAM RNA, also designated SEQ ID:3015.

[16533] Another function of VGAM304 is therefore inhibition of Paired Box Gene 7 (PAX7, Accession NM_013945), a gene which involves in myogenesis. Accordingly, utilities of VGAM304 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAX7. The function of PAX7 has been established by previous studies. In a review of 28 published cases of the pediatric soft tissue cancer alveolar rhabdomyosarcoma (OMIM Ref. No. 268220), Whang-Peng et al. (1992) found a characteristic t(2;13)(q35;q14) translocation and a variant t(1;13)(p36;q14) translocation in 64% and 18% of the cases, respectively. Subsequent molecular biology studies demonstrated that these translocations fuse the PAX3 gene (OMIM Ref. No. 193500) on chromosome 2 or the PAX7 gene on chromosome 1 with the forkhead in rhabdomyosarcoma gene (OMIM Ref. No. 136533) on chromosome 13 to generate PAX3/FKHR or PAX7/FKHR fusion genes. These genes encode chimeric transcription factors which, in the case of PAX3/FKHR, was shown to activate

excessively transcription from binding targets of the wild-type PAX3 transcription factor. Using FISH, RT-PCR, and quantitative Southern blot analyses, Barr et al. (1996) demonstrated that these fusion genes are amplified in 20% of fusion-positive tumors. In particular, they found in vivo amplification of these fusions in 1 of 22 PAX3/FKHR-positive cases and 5 of 7 PAX7/FKHR-positive cases. By representational difference analysis, Seale et al. (2000) isolated mouse Pax7 as a gene specifically expressed in cultured satellite cell-derived myoblasts. In situ hybridization revealed that Pax7 is also expressed in satellite cells residing in adult muscle. Cell culture and electron microscopic analysis showed a complete absence of satellite cells in Pax7 $-/-$ skeletal muscle. Surprisingly, fluorescence-activated cell sorting analysis indicated that the proportion of muscle-derived stem cells was unaffected. Stem cells from Pax7 $-/-$ muscle displayed an almost 10-fold increase in their ability to form hematopoietic colonies. These results demonstrated that satellite cells and muscle-derived stem cells represent distinct cell populations. Furthermore, these studies suggested that induction of Pax7 in muscle-derived stem cells induces satellite cell specification by restricting alternate develop-

mental programs. Animal model experiments lend further support to the function of PAX7. By representational difference analysis, Seale et al. (2000) isolated mouse Pax7 as a gene specifically expressed in cultured satellite cell-derived myoblasts. In situ hybridization revealed that Pax7 is also expressed in satellite cells residing in adult muscle. Cell culture and electron microscopic analysis showed a complete absence of satellite cells in Pax7 $-/-$ skeletal muscle. Surprisingly, fluorescence-activated cell sorting analysis indicated that the proportion of muscle-derived stem cells was unaffected. Stem cells from Pax7 $-/-$ muscle displayed an almost 10-fold increase in their ability to form hematopoietic colonies. These results demonstrated that satellite cells and muscle-derived stem cells represent distinct cell populations. Furthermore, these studies suggested that induction of Pax7 in muscle-derived stem cells induces satellite cell specification by restricting alternate developmental programs.

[16534] It is appreciated that the abovementioned animal model for PAX7 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[16535] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [16536] Barr, F. G.; Nauta, L. E.; Davis, R. J.; Schafer, B. W.; Nycum, L. M.; Biegel, J. A. : In vivo amplification of the PAX3–FKHR and PAX7–FKHR fusion genes in alveolar rhabdomyosarcoma. *Hum. Molec. Genet.* 5: 15–21, 1996. ; and
- [16537] Seale, P.; Sabourin, L. A.; Girgis–Gabardo, A.; Mansouri, A.; Gruss, P.; Rudnicki, M. A. : Pax7 is required for the specification of myogenic satellite cells. *Cell* 102: 777–786, 2000.
- [16538] Further studies establishing the function and utilities of PAX7 are found in John Hopkins OMIM database record ID 167410, and in cited publications numbered 10719–10721, 10338, 10722–1072 and 10714 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BCL2–like 1 (BCL2L1, Accession NM_138578) is another VGAM304 host target gene. BCL2L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCL2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2L1 BINDING SITE, designated SEQ

ID:28895, to the nucleotide sequence of VGAM304 RNA, herein designated VGAM RNA, also designated SEQ ID:3015.

[16539] Another function of VGAM304 is therefore inhibition of BCL2-like 1 (BCL2L1, Accession NM_138578). Accordingly, utilities of VGAM304 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2L1. Chromosome 20 Open Reading Frame 98 (C20orf98, Accession XM_049398) is another VGAM304 host target gene. C20orf98 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf98, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf98 BINDING SITE, designated SEQ ID:35413, to the nucleotide sequence of VGAM304 RNA, herein designated VGAM RNA, also designated SEQ ID:3015.

[16540] Another function of VGAM304 is therefore inhibition of Chromosome 20 Open Reading Frame 98 (C20orf98, Accession XM_049398). Accordingly, utilities of VGAM304 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf98. DK-

FZp547O146 (Accession NM_020224) is another VGAM304 host target gene. DKFZp547O146 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp547O146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547O146 BINDING SITE, designated SEQ ID:21484, to the nucleotide sequence of VGAM304 RNA, herein designated VGAM RNA, also designated SEQ ID:3015.

[16541] Another function of VGAM304 is therefore inhibition of DKFZp547O146 (Accession NM_020224). Accordingly, utilities of VGAM304 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547O146. FLJ11539 (Accession NM_024748) is another VGAM304 host target gene. FLJ11539 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ11539, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11539 BINDING SITE, designated SEQ ID:24085, to the nucleotide sequence of VGAM304 RNA, herein designated

VGAM RNA, also designated SEQ ID:3015.

[16542] Another function of VGAM304 is therefore inhibition of FLJ11539 (Accession NM_024748). Accordingly, utilities of VGAM304 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11539. Suppression of Tumorigenicity 7 Like (ST7L, Accession NM_017744) is another VGAM304 host target gene. ST7L BINDING SITE1 through ST7L BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ST7L, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ST7L BINDING SITE1 through ST7L BINDING SITE3, designated SEQ ID:19334, SEQ ID:28976 and SEQ ID:29206 respectively, to the nucleotide sequence of VGAM304 RNA, herein designated VGAM RNA, also designated SEQ ID:3015.

[16543] Another function of VGAM304 is therefore inhibition of Suppression of Tumorigenicity 7 Like (ST7L, Accession NM_017744). Accordingly, utilities of VGAM304 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST7L. Zinc Finger Protein 91 Homolog (mouse) (ZFP91, Accession NM_053023) is an–

other VGAM304 host target gene. ZFP91 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZFP91, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP91 BINDING SITE, designated SEQ ID:27578, to the nucleotide sequence of VGAM304 RNA, herein designated VGAM RNA, also designated SEQ ID:3015.

[16544] Another function of VGAM304 is therefore inhibition of Zinc Finger Protein 91 Homolog (mouse) (ZFP91, Accession NM_053023). Accordingly, utilities of VGAM304 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP91. LOC150157 (Accession XM_097823) is another VGAM304 host target gene. LOC150157 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150157 BINDING SITE, designated SEQ ID:41142, to the nucleotide sequence of VGAM304 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3015.

[16545] Another function of VGAM304 is therefore inhibition of LOC150157 (Accession XM_097823). Accordingly, utilities of VGAM304 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150157. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 305 (VGAM305) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16546] VGAM305 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM305 was detected is described hereinabove with reference to Figs. 1–8.

[16547] VGAM305 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 4. VGAM305 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16548] VGAM305 gene encodes a VGAM305 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM305 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM305 precursor RNA is designated SEQ ID:291, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:291 is located at position 85065 relative to the genome of Equine Herpesvirus 4.

[16549] VGAM305 precursor RNA folds onto itself, forming VGAM305 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16550] An enzyme complex designated DICER COMPLEX, `dices` the VGAM305 folded precursor RNA into VGAM305 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM305 RNA is designated SEQ ID:3016, and is provided hereinbelow with reference to the sequence listing part.

[16551] VGAM305 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM305 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM305 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[16552] VGAM305 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM305 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM305 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM305 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM305 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16553] The complementary binding of VGAM305 RNA, herein designated VGAM RNA, to host target binding sites on VGAM305 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM305 host target RNA into VGAM305 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16554] It is appreciated that VGAM305 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM305 host target genes. The mRNA of

each one of this plurality of VGAM305 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM305 RNA, herein designated VGAM RNA, and which when bound by VGAM305 RNA causes inhibition of translation of respective one or more VGAM305 host target proteins.

[16555] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM305 gene, herein designated VGAM GENE, on one or more VGAM305 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[16556] It is yet further appreciated that a function of VGAM305 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM305 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM305 correlate with, and may be deduced from, the identity of the host target genes which VGAM305 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16557] Nucleotide sequences of the VGAM305 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM305 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM305 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM305 are further described hereinbelow with reference to Table 1.

[16558] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM305 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM305 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[16559] As mentioned hereinabove with reference to Fig. 1, a function of VGAM305 gene, herein designated VGAM is inhibition of expression of VGAM305 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM305 correlate with, and may be deduced from, the identity of the target genes which VGAM305 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16560] CD5 Antigen (p56-62) (CD5, Accession NM_014207) is a VGAM305 host target gene. CD5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD5 BINDING SITE, designated SEQ ID:15476, to the nucleotide sequence of VGAM305 RNA, herein designated VGAM RNA, also designated SEQ ID:3016.

[16561] A function of VGAM305 is therefore inhibition of CD5 Antigen (p56-62) (CD5, Accession NM_014207). Accordingly, utilities of VGAM305 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with CD5. LOC148930 (Accession XM_086369) is another VGAM305 host target gene. LOC148930 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148930 BINDING SITE, designated SEQ ID:38618, to the nucleotide sequence of VGAM305 RNA, herein designated VGAM RNA, also designated SEQ ID:3016.

[16562] Another function of VGAM305 is therefore inhibition of LOC148930 (Accession XM_086369). Accordingly, utilities of VGAM305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148930. LOC158310 (Accession XM_098919) is another VGAM305 host target gene. LOC158310 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158310 BINDING SITE, designated SEQ ID:41944, to

the nucleotide sequence of VGAM305 RNA, herein designated VGAM RNA, also designated SEQ ID:3016.

[16563] Another function of VGAM305 is therefore inhibition of LOC158310 (Accession XM_098919). Accordingly, utilities of VGAM305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158310. LOC256950 (Accession XM_170922) is another VGAM305 host target gene. LOC256950 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256950 BINDING SITE, designated SEQ ID:45699, to the nucleotide sequence of VGAM305 RNA, herein designated VGAM RNA, also designated SEQ ID:3016.

[16564] Another function of VGAM305 is therefore inhibition of LOC256950 (Accession XM_170922). Accordingly, utilities of VGAM305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256950. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 306 (VGAM306) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16565] VGAM306 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM306 was detected is described hereinabove with reference to Figs. 1–8.

[16566] VGAM306 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 4. VGAM306 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16567] VGAM306 gene encodes a VGAM306 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM306 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM306 precursor RNA is designated SEQ ID:292, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:292 is located at position 87168 relative to the genome of Equine Herpesvirus 4.

[16568] VGAM306 precursor RNA folds onto itself, forming VGAM306 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16569] An enzyme complex designated DICER COMPLEX, `dices` the VGAM306 folded precursor RNA into VGAM306 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM306 RNA is designated SEQ ID:3017, and is provided hereinbelow with reference to the sequence listing part.

[16570] VGAM306 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM306 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM306 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[16571] VGAM306 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM306 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM306 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM306 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM306 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16572] The complementary binding of VGAM306 RNA, herein designated VGAM RNA, to host target binding sites on VGAM306 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM306 host target RNA into VGAM306 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16573] It is appreciated that VGAM306 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM306 host target genes. The mRNA of each one of this plurality of VGAM306 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM306 RNA, herein designated VGAM RNA, and which when bound by VGAM306 RNA causes inhibition of translation of respective one or more VGAM306 host target proteins.

[16574] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM306 gene, herein designated VGAM GENE, on one or more VGAM306 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16575] It is yet further appreciated that a function of VGAM306 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM306 correlate with, and may be deduced from, the identity of the

host target genes which VGAM306 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [16576] Nucleotide sequences of the VGAM306 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM306 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM306 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM306 are further described hereinbelow with reference to Table 1.
- [16577] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM306 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM306 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [16578] As mentioned hereinabove with reference to Fig. 1, a function of VGAM306 gene, herein designated VGAM is inhibition of expression of VGAM306 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM306 correlate with, and may be deduced from, the identity of the target genes which VGAM306

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16579] CD28 Antigen (Tp44) (CD28, Accession NM_006139) is a VGAM306 host target gene. CD28 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD28 BINDING SITE, designated SEQ ID:12785, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:3017.

[16580] A function of VGAM306 is therefore inhibition of CD28 Antigen (Tp44) (CD28, Accession NM_006139), a gene which possibly involved in t-cell activation. Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD28. The function of CD28 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM281. Membrane Protein, Palmitoylated 5 (MAGUK p55 subfamily member 5) (MPP5, Accession NM_022474) is another VGAM306 host target gene. MPP5

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MPP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPP5 BINDING SITE, designated SEQ ID:22840, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:3017.

[16581] Another function of VGAM306 is therefore inhibition of Membrane Protein, Palmitoylated 5 (MAGUK p55 subfamily member 5) (MPP5, Accession NM_022474), a gene which may regulate transmembrane proteins that bind calcium, calmodulin, or nucleotides. Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPP5. The function of MPP5 has been established by previous studies. Members of the peripheral membrane-associated guanylate kinase (MAGUK) family function in tumor suppression and receptor clustering by forming multiprotein complexes containing distinct sets of transmembrane, cytoskeletal, and cytoplasmic signaling proteins. All MAGUKs contain a PDZ-SH3-GUK core and are divided into 4 subfamilies, DLG-like (see OMIM Ref. No. DLG1;

601014), ZO1-like (see OMIM Ref. No. TJP1; 601009), p55-like (see OMIM Ref. No. MPP1; 305360), and LIN2-like (see OMIM Ref. No. CASK; 300172), based on their size and the presence of additional domains (Tseng et al., 2001). MPP5 is a member of the p55-like MAGUK subfamily. Kamberov et al. (2000) cloned and characterized the mouse Mpp5 and Mpp6 (OMIM Ref. No. 606959) genes, which they called Pals1 and Pals2, respectively. The Pals proteins bind to mouse Lin7 (OMIM Ref. No. 603380) through a region N-terminal to their PDZ domains. Roh et al. (2002) showed that Pals1 contains 2 Lin2 (OMIM Ref. No. 300172)/Lin7-binding domains, which they called L27 domains, N-terminal to the PDZ domain. The C-terminal L27 domain, L27C, binds Lin7, whereas the N-terminal L27 domain, L27N, targets Pals1 to tight junctions by binding to Patj (INAD; 603199) and to Crb1 (OMIM Ref. No. 604210).

[16582] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16583] Roh, M. H.; Makarova, O.; Liu, C.-J.; Shin, K.; Lee, S.; Laurenc, S.; Goyal, M.; Wiggins, R.; Margolis, B. : The Maguk protein, Pals1, functions as an adapter, linking mam-

malian homologues of Crumbs and Discs Lost. J. Cell Biol. 157: 161–172, 2002. ; and

[16584] Tseng, T.–C.; Marfatia, S. M.; Bryant, P. J.; Pack, S.; Zhuang, A.; O'Brien, J. E.; Lin, L.; Hanada, T.; Chishti, A. H. : VAM–1: a new member of the MAGUK family binds to human Veli–1.

[16585] Further studies establishing the function and utilities of MPP5 are found in John Hopkins OMIM database record ID 606958, and in cited publications numbered 513 and 7979–5140 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phosphoinositide–3–kinase, Class 2, Beta Polypeptide (PIK3C2B, Accession NM_002646) is another VGAM306 host target gene. PIK3C2B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIK3C2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3C2B BINDING SITE, designated SEQ ID:8510, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:3017.

[16586] Another function of VGAM306 is therefore inhibition of

Phosphoinositide-3-kinase, Class 2, Beta Polypeptide (PIK3C2B, Accession NM_002646). Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3C2B. DKFZP727C091 (Accession XM_038689) is another VGAM306 host target gene. DKFZP727C091 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP727C091, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP727C091 BINDING SITE, designated SEQ ID:32908, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:3017.

[16587] Another function of VGAM306 is therefore inhibition of DKFZP727C091 (Accession XM_038689). Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP727C091. Dickkopf Homolog 3 (*Xenopus laevis*) (DKK3, Accession NM_013253) is another VGAM306 host target gene. DKK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKK3, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKK3 BINDING SITE, designated SEQ ID:14924, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:3017.

[16588] Another function of VGAM306 is therefore inhibition of Dickkopf Homolog 3 (*Xenopus laevis*) (DKK3, Accession NM_013253). Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKK3. KIAA0323 (Accession XM_032634) is another VGAM306 host target gene. KIAA0323 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0323 BINDING SITE, designated SEQ ID:31698, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:3017.

[16589] Another function of VGAM306 is therefore inhibition of KIAA0323 (Accession XM_032634). Accordingly, utilities

of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0323. KIAA1023 (Accession NM_017604) is another VGAM306 host target gene. KIAA1023 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1023, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1023 BINDING SITE, designated SEQ ID:19099, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:3017.

[16590] Another function of VGAM306 is therefore inhibition of KIAA1023 (Accession NM_017604). Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1023. KIAA1196 (Accession XM_028968) is another VGAM306 host target gene. KIAA1196 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1196 BINDING SITE, designated SEQ ID:30824, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:3017.

[16591] Another function of VGAM306 is therefore inhibition of KIAA1196 (Accession XM_028968). Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1196. LOC112817 (Accession NM_138413) is another VGAM306 host target gene. LOC112817 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC112817, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112817 BINDING SITE, designated SEQ ID:28784, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:3017.

[16592] Another function of VGAM306 is therefore inhibition of LOC112817 (Accession NM_138413). Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112817. LOC253675 (Accession XM_172990) is another VGAM306 host target gene. LOC253675 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253675, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253675 BINDING SITE, designated SEQ ID:46269, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:3017.

[16593] Another function of VGAM306 is therefore inhibition of LOC253675 (Accession XM_172990). Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253675. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 307 (VGAM307) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16594] VGAM307 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM307 was detected is described hereinabove with reference to Figs. 1-8.

[16595] VGAM307 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus E. VGAM307 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16596] VGAM307 gene encodes a VGAM307 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM307 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM307 precursor RNA is designated SEQ ID:293, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:293 is located at position 1062 relative to the genome of Human Adenovirus E.

[16597] VGAM307 precursor RNA folds onto itself, forming VGAM307 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[16598] An enzyme complex designated DICER COMPLEX, `dices` the VGAM307 folded precursor RNA into VGAM307 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM307 RNA is designated SEQ ID:3018, and is provided hereinbelow with reference to the sequence listing part.

[16599] VGAM307 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM307 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM307 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[16600] VGAM307 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM307 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM307 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM307 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM307 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[16601] The complementary binding of VGAM307 RNA, herein designated VGAM RNA, to host target binding sites on VGAM307 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM307 host target RNA into VGAM307 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16602] It is appreciated that VGAM307 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM307 host target genes. The mRNA of each one of this plurality of VGAM307 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM307 RNA, herein designated VGAM RNA, and which when bound by VGAM307 RNA causes inhibition of translation of respective one or more VGAM307 host target proteins.

[16603] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM307 gene, herein designated VGAM GENE, on one or more VGAM307 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16604] It is yet further appreciated that a function of VGAM307 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM307 include diagnosis, prevention and treatment of viral infection by Human Adenovirus E. Specific functions, and accordingly utilities, of VGAM307 correlate with, and may be deduced from, the identity of the host target genes which VGAM307 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16605] Nucleotide sequences of the VGAM307 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM307 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM307 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM307 are further described hereinbelow with reference to Table 1.

[16606] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM307 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM307 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16607] As mentioned hereinabove with reference to Fig. 1, a function of VGAM307 gene, herein designated VGAM is inhibition of expression of VGAM307 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM307 correlate with, and may be deduced from, the identity of the target genes which VGAM307 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16608] Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM_114147) is a VGAM307 host target gene. EIF1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of EIF1A BINDING SITE, designated SEQ ID:42717, to the nucleotide sequence of VGAM307 RNA, herein designated VGAM RNA, also designated SEQ ID:3018.

[16609] A function of VGAM307 is therefore inhibition of Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM_114147), a gene which seems to be required for maximal rate of protein biosynthesis. Accordingly, utilities of VGAM307 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF1A. The function of EIF1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120. DNA Cross-link Repair 1A (PSO2 homolog, *S. cerevisiae*) (DCLRE1A, Accession XM_044815) is another VGAM307 host target gene. DCLRE1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DCLRE1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCLRE1A BINDING SITE, designated SEQ ID:34279, to the nucleotide sequence of VGAM307 RNA, herein designated VGAM

RNA, also designated SEQ ID:3018.

[16610] Another function of VGAM307 is therefore inhibition of DNA Cross-link Repair 1A (PSO2 homolog, *S. cerevisiae*) (DCLRE1A, Accession XM_044815). Accordingly, utilities of VGAM307 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCLRE1A. FLJ31737 (Accession NM_144984) is another VGAM307 host target gene. FLJ31737 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31737 BINDING SITE, designated SEQ ID:29588, to the nucleotide sequence of VGAM307 RNA, herein designated VGAM RNA, also designated SEQ ID:3018.

[16611] Another function of VGAM307 is therefore inhibition of FLJ31737 (Accession NM_144984). Accordingly, utilities of VGAM307 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31737. LOC145134 (Accession XM_096722) is another VGAM307 host target gene. LOC145134 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of

mRNA encoded by LOC145134, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145134 BINDING SITE, designated SEQ ID:40499, to the nucleotide sequence of VGAM307 RNA, herein designated VGAM RNA, also designated SEQ ID:3018.

[16612] Another function of VGAM307 is therefore inhibition of LOC145134 (Accession XM_096722). Accordingly, utilities of VGAM307 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145134. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 308 (VGAM308) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16613] VGAM308 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM308 was detected is described hereinabove with reference to Figs. 1–8.

[16614] VGAM308 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Paramecium Bursaria Chlorella Virus 1. VGAM308 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16615] VGAM308 gene encodes a VGAM308 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM308 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM308 precursor RNA is designated SEQ ID:294, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:294 is located at position 260067 relative to the genome of Paramecium Bursaria Chlorella Virus 1.

[16616] VGAM308 precursor RNA folds onto itself, forming VGAM308 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16617] An enzyme complex designated DICER COMPLEX, `dices` the VGAM308 folded precursor RNA into VGAM308 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM308 RNA is designated SEQ ID:3019, and is provided hereinbelow with reference to the sequence listing part.

[16618] VGAM308 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM308 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM308 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[16619] VGAM308 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM308 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM308 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM308 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM308 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16620] The complementary binding of VGAM308 RNA, herein designated VGAM RNA, to host target binding sites on VGAM308 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM308 host tar-

get RNA into VGAM308 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16621] It is appreciated that VGAM308 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM308 host target genes. The mRNA of each one of this plurality of VGAM308 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM308 RNA, herein designated VGAM RNA, and which when bound by VGAM308 RNA causes inhibition of translation of respective one or more VGAM308 host target proteins.

[16622] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM308 gene, herein designated VGAM GENE, on one or more VGAM308 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16623] It is yet further appreciated that a function of VGAM308 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM308 include diagnosis, prevention and treatment of viral infection by Paramecium Bursaria Chlorella Virus 1. Specific functions, and accordingly utilities, of VGAM308 correlate with, and may be deduced from, the identity of the host target genes which VGAM308 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16624] Nucleotide sequences of the VGAM308 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM308 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM308 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM308 are further

described hereinbelow with reference to Table 1.

[16625] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM308 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM308 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16626] As mentioned hereinabove with reference to Fig. 1, a function of VGAM308 gene, herein designated VGAM is inhibition of expression of VGAM308 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM308 correlate with, and may be deduced from, the identity of the target genes which VGAM308 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16627] Transcription Factor 12 (HTF4, helix-loop-helix transcription factors 4) (TCF12, Accession NM_003205) is a VGAM308 host target gene. TCF12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCF12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of TCF12 BINDING SITE, designated SEQ ID:9202, to the nucleotide sequence of VGAM308 RNA, herein designated VGAM RNA, also designated SEQ ID:3019.

[16628] A function of VGAM308 is therefore inhibition of Transcription Factor 12 (HTF4, helix-loop-helix transcription factors 4) (TCF12, Accession NM_003205), a gene which may play important roles during development of the nervous system as well as in other organ systems. Accordingly, utilities of VGAM308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF12. The function of TCF12 has been established by previous studies. A partial cDNA for HTF4 was obtained by Zhang et al. (1991) which predicted a protein that is a member of the class A basic helix-loop-helix (bHLH) family. The same cDNA, designated HEB, was cloned by Hu et al. (1992). Based on studies of the mouse and chicken cDNAs, Zhang and Bina (1992) proposed that transcripts of HTF4 can be differentially spliced to yield distinct but related proteins which are evolutionarily similar to the products of the E2A gene, also known as transcription factor 3 (TCF3; 147141). In vitro assays have shown that HTF4 can form heterodimers with other bHLH

proteins of class A (e.g., OMIM Ref. No. 147141) and class B (e.g., the myogenic factors; MYF3, 159970; MYF5, 159990; and MYF6, 159991), as well as the inhibitor of DNA binding (ID1; 600349) and stem cell leukemia hematopoietic transcription factor (TAL1; 187040). In DNA binding assays, complexes of HTF4 with the myogenic factors have a relatively high affinity for the E box motifs of the mE2 (OMIM Ref. No. CACGTG) and kappa E2/muE5 (OMIM Ref. No. CACCTG) types, whereas heterodimers of HTF4 and TAL1 interact poorly (Doyle et al., 1994). These results and those obtained from transient expression studies indicated to the authors that leukemogenesis caused by TAL1 might include a pathway where TAL1 would act as a negative regulator of gene expression by forming a complex with class A bHLH proteins. Zhang et al. (1995) used a panel of somatic cell hybrids to map HTF4 to chromosome 15. By fluorescence in situ hybridization, they further localized the gene to 15q21. By Northern blot analysis, Zhang et al. (1995) showed that TCF12 is expressed, at varying levels, in many human cell lines and tissues. High levels of transcription in Jurkat cells support the view that TCF12 gene products may play a central role in T cell regulation (Hu et al., 1992; Sawada

and Littman, 1993; and Doyle et al., 1994), and detection of the mRNA in human heart and skeletal muscle supports a role for TCF12 in myogenesis.

[16629] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16630] Doyle, K.; Zhang, Y.; Baer, R.; Bina, M. : Distinguishable patterns of protein–DNA interactions involving complexes of basic helix–loop–helix proteins. J. Biol. Chem. 269: 12099–12105, 1994. ; and

[16631] Zhang, Y.; Flejter, W. L.; Barcroft, C. L.; Riviere, M.; Szpirer, J.; Szpirer, C.; Bina, M. : Localization of the human HTF4 transcription factors 4 gene (TCF12) to chromosome 15q21. C.

[16632] Further studies establishing the function and utilities of TCF12 are found in John Hopkins OMIM database record ID 600480, and in cited publications numbered 9519–9524 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Butyrophilin, Subfamily 2, Member A1 (BTN2A1, Accession NM_078476) is another VGAM308 host target gene. BTN2A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

BTN2A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTN2A1 BINDING SITE, designated SEQ ID:27802, to the nucleotide sequence of VGAM308 RNA, herein designated VGAM RNA, also designated SEQ ID:3019.

[16633] Another function of VGAM308 is therefore inhibition of Butyrophilin, Subfamily 2, Member A1 (BTN2A1, Accession NM_078476). Accordingly, utilities of VGAM308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN2A1. PP35 (Accession NM_007016) is another VGAM308 host target gene. PP35 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PP35, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP35 BINDING SITE, designated SEQ ID:13872, to the nucleotide sequence of VGAM308 RNA, herein designated VGAM RNA, also designated SEQ ID:3019.

[16634] Another function of VGAM308 is therefore inhibition of PP35 (Accession NM_007016). Accordingly, utilities of

VGAM308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP35.

LOC159121 (Accession XM_099028) is another VGAM308 host target gene. LOC159121 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC159121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159121 BINDING SITE, designated SEQ ID:42062, to the nucleotide sequence of VGAM308 RNA, herein designated VGAM RNA, also designated SEQ ID:3019.

[16635] Another function of VGAM308 is therefore inhibition of LOC159121 (Accession XM_099028). Accordingly, utilities of VGAM308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159121. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 309 (VGAM309) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16636] VGAM309 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM309 was detected is described hereinabove with reference to Figs. 1–8.

[16637] VGAM309 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 6. VGAM309 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16638] VGAM309 gene encodes a VGAM309 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM309 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM309 precursor RNA is designated SEQ ID:295, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:295 is located at position 15267 relative to the genome of Human Herpesvirus 6.

[16639] VGAM309 precursor RNA folds onto itself, forming VGAM309 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16640] An enzyme complex designated DICER COMPLEX, `dices` the VGAM309 folded precursor RNA into VGAM309 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM309 RNA is designated SEQ ID:3020, and is provided hereinbelow with reference to the sequence listing part.

[16641] VGAM309 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM309 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM309 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[16642] VGAM309 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM309 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM309 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM309 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM309 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16643] The complementary binding of VGAM309 RNA, herein designated VGAM RNA, to host target binding sites on VGAM309 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM309 host target RNA into VGAM309 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16644] It is appreciated that VGAM309 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM309 host target genes. The mRNA of each one of this plurality of VGAM309 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM309 RNA, herein designated VGAM RNA, and which when bound by VGAM309 RNA causes inhibition of translation of respective one or more VGAM309 host target proteins.

[16645] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM309 gene, herein designated VGAM GENE, on one or more VGAM309 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16646] It is yet further appreciated that a function of VGAM309 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 6. Specific functions, and accordingly utilities, of VGAM309 correlate with, and may be deduced from, the identity of the host target genes which VGAM309 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16647] Nucleotide sequences of the VGAM309 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM309 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM309 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM309 are further
described hereinbelow with reference to Table 1.

[16648] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM309 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM309 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[16649] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM309 gene, herein designated VGAM is
inhibition of expression of VGAM309 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM309 correlate with, and may be deduced
from, the identity of the target genes which VGAM309
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[16650] Frizzled Homolog 4 (Drosophila) (FZD4, Accession
NM_012193) is a VGAM309 host target gene. FZD4 BIND-

ING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FZD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FZD4 BINDING SITE, designated SEQ ID:14487, to the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:3020.

[16651] A function of VGAM309 is therefore inhibition of Frizzled Homolog 4 (Drosophila) (FZD4, Accession NM_012193), a gene which may function in cell polarity, cell fate specification and cancer; similar to frizzled receptor family, has seven transmembrane domains. Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FZD4. The function of FZD4 has been established by previous studies. Members of the 'frizzled' (FZ) gene family (see OMIM Ref. No. 601766) encode 7-transmembrane domain proteins that are receptors for Wnt (see OMIM Ref. No. 164975) signaling proteins. By screening a human fetal lung cDNA library with an FZD4 cDNA fragment isolated from a human gastric cancer cDNA pool, Kirikoshi et al. (1999) obtained a full-length cDNA of FZD4. FZD4 en-

codes a deduced 537-amino acid protein that has a cysteine-rich domain in the N-terminal extracellular region, 2 cysteine residues in the second and third extracellular loops, 2 N-linked glycosylation extracellular sites, and the S/T-X-V motif in the C terminus. Amino acid sequence identity with other FZD proteins ranged from 39 to 52% in the N terminus to 42 to 69% in the transmembrane domains. Northern blot analysis revealed expression of a 7.7-kb transcript in large amounts in adult heart, skeletal muscle, ovary, and fetal kidney, in moderate amounts in adult liver, kidney, pancreas, spleen, and fetal lung, and in small amounts in placenta, adult lung, prostate, testis, colon, fetal brain, and liver. Expression was also strong in HeLa cells but not in several cancer cell lines. Familial exudative vitreoretinopathy (FEVR) is a hereditary ocular disorder characterized by a failure of peripheral retinal vascularization. Loci associated with FEVR map to 11q13-q23 (EVR1; 133780), Xp11.4 (EVR2; 305390), and 11p13-p12 (EVR3; 605750). In a large Canadian family of British descent, Robitaille et al. (2002) demonstrated linkage to 11q13-q23 for autosomal dominant FEVR and refined the disease locus to a genomic region spanning 1.55 Mb. The region contained the FZD4 gene, which they subjected to

mutation search and identified in affected individuals a deletion of 6 nucleotides, 1479–1484, resulting in deletion of 2 highly conserved amino acids, met493 and trp494. In a second small family they found a deletion of 2 nucleotides, 1501–1502, that resulted in a frameshift at leu501, creating a stop codon at residue 533. Both mutations were located in exon 2 and altered the seventh transmembrane domain and the intracellular carboxy-terminal tail, respectively. No mutations in FZD4 were detected in 3 other small families with FEVR. Robitaille et al. (2002) presented data indicating that the changes in FZD4 in these families with autosomal dominant FEVR represented loss of function mutations.

[16652] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16653] Kirikoshi, H.; Sagara, N.; Koike, J.; Tanaka, K.; Sekihara, H.; Hirai, M.; Katoh, M. : Molecular cloning and characterization of human frizzled-4 on chromosome 11q14-q21. Biochem. Biophys. Res. Commun. 264: 955–961, 1999. ; and

[16654] Robitaille, J.; MacDonald, M. L. E.; Kaykas, A.; Sheldahl, L. C.; Zeisler, J.; Dube, M.-P.; Zhang, L.-H.; Singaraja, R. R.;

Guernsey, D. L.; Zhang, B.; Siebert, L. F.; Hoskin-Mott, A.;

[16655] Further studies establishing the function and utilities of FZD4 are found in John Hopkins OMIM database record ID 604579, and in cited publications numbered 493 and 4941 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Neuropeptide Y Receptor Y2 (NPY2R, Accession NM_000910) is another VGAM309 host target gene. NPY2R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NPY2R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPY2R BINDING SITE, designated SEQ ID:6610, to the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:3020.

[16656] Another function of VGAM309 is therefore inhibition of Neuropeptide Y Receptor Y2 (NPY2R, Accession NM_000910), a gene which stimulates intracellular calcium flux and may modulate psychomotor activity, food intake, endocrine secretion and vasoconstriction. Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with NPY2R. The function of NPY2R has been established by previous studies. Neuropeptide Y (NPY) signals through a family of G protein-coupled receptors present in the brain and sympathetic neurons. At least 3 types of neuropeptide Y receptor have been defined on the basis of pharmacologic criteria, tissue distribution, and structure of the encoding gene; see 162641 and 162643. Rose et al. (1995) reported the expression cloning in COS cells of a cDNA for the human type 2 receptor, NPY2R. Transfected cells showed high affinity for NPY (OMIM Ref. No. 162640), peptide YY (PYY; 600781), and a fragment of NPY including amino acids 13 to 36. The predicted 381-amino acid protein has 7 transmembrane domains characteristic of G protein-coupled receptors and is only 31% identical to the human Y1 receptor (NPY1R; 162641). A 4-kb mRNA was detected on Northern blots of tissue samples from several regions of the nervous system. Gerald et al. (1995) cloned the cDNA corresponding to the human Y2 receptor from a human hippocampal cDNA expression library using a radiolabeled PYY-binding assay. They expressed the Y2 gene in COS-7 cells and performed a hormone-binding assay which showed that the Y2 receptor binds (from highest to lowest affinity) PYY, NPY,

and pancreatic polypeptide (PP; 167780) hormones.

[16657] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16658] Gerald, C.; Walker, M. W.; Vaysse, P. J.-J.; He, C.; Branchek, T. A.; Weinshank, R. L. : Expression cloning and pharmacological characterization of a human hippocampal neuropeptide Y/peptide YY Y2 receptor subtype. J. Biol. Chem. 270: 26758–26761, 1995. ; and

[16659] Rose, P. M.; Fernandes, P.; Lynch, J. S.; Frazier, S. T.; Fisher, S. M.; Kodukula, K.; Kienzle, B.; Seethala, R. : Cloning and functional expression of a cDNA encoding a human type 2 ne.

[16660] Further studies establishing the function and utilities of NPY2R are found in John Hopkins OMIM database record ID 162642, and in cited publications numbered 3220–322 and 3218 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. 2'-5'-oligoadenylate Synthetase 3, 100kDa (OAS3, Accession NM_006187) is another VGAM309 host target gene. OAS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OAS3, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OAS3 BINDING SITE, designated SEQ ID:12860, to the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:3020.

[16661] Another function of VGAM309 is therefore inhibition of 2'-5'-oligoadenylate Synthetase 3, 100kDa (OAS3, Accession NM_006187), a gene which may play a role in mediating resistance to virus infection, control of cell growth, differentiation, and apoptosis. Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OAS3. The function of OAS3 has been established by previous studies. The 2-prime,5-prime oligoadenylate synthetases (OASs) are interferon-induced proteins characterized by their capacity to catalyze the synthesis of 2-prime,5-prime oligomers of adenosine (2-5As). See OAS1 (OMIM Ref. No. 164350). Hovanessian et al. (1987) found that interferon-treated human cells contain several OASs corresponding to proteins of 40 (OAS1), 46 (OAS1), 69 (OAS2; 603350), and 100 kD. Hovnanian et al. (1998) reported that the predicted OAS3, or p100, protein contains 3 adjacent OAS1-like domains. The domains share

44 to 60% protein sequence similarity with each other and 42 to 60% sequence identity with the conserved domain of OAS1. The authors noted that OAS1, OAS2, and OAS3 contain 1, 2, and 3 conserved OAS domains or units, respectively. Northern blot analysis revealed that OAS3 is expressed as a 7-kb interferon-induced mRNA in HeLa cells. By fluorescence in situ hybridization and by inclusion within mapped clones, Hovnanian et al. (1998) determined that the OAS1, OAS2, and OAS3 genes are clustered with a 130-kb region on 12q24.2.

[16662] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16663] Hovanessian, A. G.; Laurent, A. G.; Chebath, J.; Galabru, J.; Robert, N.; Svab, J. : Identification of 69-kd and 100-kd forms of 2-5A synthetase in interferon-treated human cells by specific monoclonal antibodies. EMBO J. 6: 1273-1280, 1987. ; and

[16664] Hovnanian, A.; Rebouillat, D.; Mattei, M.-G.; Levy, E. R.; Marie, I.; Monaco, A. P.; Hovanessian, A. G. : The human 2-prime,5-prime-oligoadenylate synthetase locus is composed of three.

[16665] Further studies establishing the function and utilities of

OAS3 are found in John Hopkins OMIM database record ID 603351, and in cited publications numbered 8009 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP564O1664 (Accession NM_030800) is another VGAM309 host target gene. DKFZP564O1664 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564O1664, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O1664 BINDING SITE, designated SEQ ID:25102, to the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:3020.

[16666] Another function of VGAM309 is therefore inhibition of DKFZP564O1664 (Accession NM_030800). Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O1664. FLJ12800 (Accession NM_022903) is another VGAM309 host target gene. FLJ12800 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12800, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12800 BINDING SITE, designated SEQ ID:23194, to the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:3020.

[16667] Another function of VGAM309 is therefore inhibition of FLJ12800 (Accession NM_022903). Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12800. FLJ21459 (Accession NM_024521) is another VGAM309 host target gene. FLJ21459 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21459, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21459 BINDING SITE, designated SEQ ID:23720, to the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:3020.

[16668] Another function of VGAM309 is therefore inhibition of FLJ21459 (Accession NM_024521). Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21459.

KIAA0329 (Accession NM_014844) is another VGAM309 host target gene. KIAA0329 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0329, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0329 BINDING SITE, designated SEQ ID:16878, to the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:3020.

[16669] Another function of VGAM309 is therefore inhibition of KIAA0329 (Accession NM_014844). Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0329. KIAA1416 (Accession XM_098762) is another VGAM309 host target gene. KIAA1416 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1416 BINDING SITE, designated SEQ ID:41806, to the nucleotide sequence of VGAM309 RNA, herein designated

VGAM RNA, also designated SEQ ID:3020.

[16670] Another function of VGAM309 is therefore inhibition of KIAA1416 (Accession XM_098762). Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1416. SDF1 (Accession XM_165565) is another VGAM309 host target gene. SDF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDF1 BINDING SITE, designated SEQ ID:43688, to the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:3020.

[16671] Another function of VGAM309 is therefore inhibition of SDF1 (Accession XM_165565). Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDF1. LOC146667 (Accession XM_097044) is another VGAM309 host target gene. LOC146667 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146667, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146667 BINDING SITE, designated SEQ ID:40711, to the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:3020.

[16672] Another function of VGAM309 is therefore inhibition of LOC146667 (Accession XM_097044). Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146667. LOC153937 (Accession XM_087813) is another VGAM309 host target gene. LOC153937 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153937 BINDING SITE, designated SEQ ID:39446, to the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:3020.

[16673] Another function of VGAM309 is therefore inhibition of LOC153937 (Accession XM_087813). Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC153937. LOC254057 (Accession XM_173085) is another VGAM309 host target gene. LOC254057 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC254057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254057 BINDING SITE, designated SEQ ID:46346, to the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:3020.

[16674] Another function of VGAM309 is therefore inhibition of LOC254057 (Accession XM_173085). Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254057. LOC91050 (Accession XM_035703) is another VGAM309 host target gene. LOC91050 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91050, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91050 BINDING SITE, designated SEQ ID:32336, to the

nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:3020.

[16675] Another function of VGAM309 is therefore inhibition of LOC91050 (Accession XM_035703). Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91050. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 310 (VGAM310) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16676] VGAM310 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM310 was detected is described hereinabove with reference to Figs. 1–8.

[16677] VGAM310 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pothos Latent Virus. VGAM310 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16678] VGAM310 gene encodes a VGAM310 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM310 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM310 precursor RNA is designated SEQ ID:296, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:296 is located at position 512 relative to the genome of Pothos Latent Virus.

[16679] VGAM310 precursor RNA folds onto itself, forming VGAM310 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16680] An enzyme complex designated DICER COMPLEX, `dices` the VGAM310 folded precursor RNA into VGAM310 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM310 RNA is designated SEQ ID:3021, and is provided hereinbelow with reference to the sequence listing part.

[16681] VGAM310 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM310 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM310 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[16682] VGAM310 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM310 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM310 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM310 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM310 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16683] The complementary binding of VGAM310 RNA, herein designated VGAM RNA, to host target binding sites on VGAM310 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM310 host target RNA into VGAM310 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16684] It is appreciated that VGAM310 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM310 host target genes. The mRNA of each one of this plurality of VGAM310 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM310 RNA, herein designated VGAM RNA, and which when bound by VGAM310 RNA causes inhibition of translation of respective one or more VGAM310 host target proteins.

[16685] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM310 gene, herein designated VGAM GENE, on one or more VGAM310 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[16686] It is yet further appreciated that a function of VGAM310 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM310 include diagnosis, prevention and treatment of viral infection by Pothos Latent Virus. Specific functions, and accordingly utilities, of VGAM310 correlate with, and may be deduced from, the identity of the host target genes which VGAM310 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[16687] Nucleotide sequences of the VGAM310 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM310 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM310 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM310 are further described hereinbelow with reference to Table 1.

[16688] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM310 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM310 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16689] As mentioned hereinabove with reference to Fig. 1, a function of VGAM310 gene, herein designated VGAM is inhibition of expression of VGAM310 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM310 correlate with, and may be deduced from, the identity of the target genes which VGAM310 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16690] Inositol 1,4,5-triphosphate Receptor, Type 3 (ITPR3, Accession NM_002224) is a VGAM310 host target gene. ITPR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITPR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPR3 BINDING SITE, designated SEQ ID:7996, to the nucleotide sequence of VGAM310 RNA, herein designated VGAM RNA, also designated SEQ ID:3021.

[16691] A function of VGAM310 is therefore inhibition of Inositol 1,4,5-triphosphate Receptor, Type 3 (ITPR3, Accession

NM_002224), a gene which may be responsible for calcium release from intracellular stores. Accordingly, utilities of VGAM310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPR3. The function of ITPR3 has been established by previous studies. See 147265. Ozcelik et al. (1991) found that a cDNA probe for ITPR3 hybridized to DNA from hybrid cells containing human chromosome 6. In one hybrid that carried 6pter-p21, in the absence of an intact copy of this chromosome, hybridization was observed, thus mapping the gene to 6pter-p21. ITPR3 transduces many hormonal signals that regulate $\text{Ca}(2+)$ -dependent processes in the intestinal epithelium. Maranto (1994) described complete sequence of the ITPR3 polypeptide (2,671 amino acids). Primary structure analysis indicated a pattern of conserved and variable regions, characteristic of the particular gene family. Immunocytochemical localization in the intestine was determined. Yamamoto-Hino et al. (1994) likewise mapped the ITPR3 gene to chromosome 6, specifically to 6p21, by isotopic in situ hybridization. They showed that the type 3 receptor was present in all hematopoietic and lymphoma cell lines tested

[16692] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[16693] Maranto, A. R. : Primary structure, ligand binding, and localization of the human type 3 inositol

1,4,5-trisphosphate receptor expressed in intestinal epithelium. J. Biol. Chem. 269: 1222-1230, 1994. ; and

[16694] Ozcelik, T.; Suedhof, T. C.; Francke, U. : The genes for inositol 1,4,5-triphosphate receptors 1 (ITPR1) and 3 (ITPR3) are localized on human chromosomes 3p and 6pter-p21, respectively.

[16695] Further studies establishing the function and utilities of ITPR3 are found in John Hopkins OMIM database record ID 147267, and in cited publications numbered 4821-4823 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer-

ence. Microtubule-associated Protein, RP/EB Family, Member 2 (MAPRE2, Accession NM_014268) is another VGAM310 host target gene. MAPRE2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAPRE2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPRE2 BINDING

SITE, designated SEQ ID:15547, to the nucleotide sequence of VGAM310 RNA, herein designated VGAM RNA, also designated SEQ ID:3021.

[16696] Another function of VGAM310 is therefore inhibition of Microtubule-associated Protein, RP/EB Family, Member 2 (MAPRE2, Accession NM_014268), a gene which The functional inactivation of the APC gene product is a key event in colorectal tumorigenesis. Accordingly, utilities of VGAM310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPRE2. The function of MAPRE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. Ribosomal Protein L15 (RPL15, Accession NM_002948) is another VGAM310 host target gene. RPL15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPL15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPL15 BINDING SITE, designated SEQ ID:8859, to the nucleotide sequence of VGAM310 RNA, herein designated VGAM RNA, also designated SEQ ID:3021.

[16697] Another function of VGAM310 is therefore inhibition of Ribosomal Protein L15 (RPL15, Accession NM_002948). Accordingly, utilities of VGAM310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPL15. FLJ10737 (Accession NM_018198) is another VGAM310 host target gene. FLJ10737 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10737 BINDING SITE, designated SEQ ID:20065, to the nucleotide sequence of VGAM310 RNA, herein designated VGAM RNA, also designated SEQ ID:3021.

[16698] Another function of VGAM310 is therefore inhibition of FLJ10737 (Accession NM_018198). Accordingly, utilities of VGAM310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10737. Hyaluronan Binding Protein 2 (HABP2, Accession NM_004132) is another VGAM310 host target gene. HABP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HABP2, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HABP2 BINDING SITE, designated SEQ ID:10343, to the nucleotide sequence of VGAM310 RNA, herein designated VGAM RNA, also designated SEQ ID:3021.

[16699] Another function of VGAM310 is therefore inhibition of Hyaluronan Binding Protein 2 (HABP2, Accession NM_004132). Accordingly, utilities of VGAM310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HABP2. KIAA0553 (Accession XM_045981) is another VGAM310 host target gene. KIAA0553 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0553, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0553 BINDING SITE, designated SEQ ID:34637, to the nucleotide sequence of VGAM310 RNA, herein designated VGAM RNA, also designated SEQ ID:3021.

[16700] Another function of VGAM310 is therefore inhibition of KIAA0553 (Accession XM_045981). Accordingly, utilities

of VGAM310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0553. LOC221839 (Accession XM_166506) is another VGAM310 host target gene. LOC221839 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221839, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221839 BINDING SITE, designated SEQ ID:44432, to the nucleotide sequence of VGAM310 RNA, herein designated VGAM RNA, also designated SEQ ID:3021.

[16701] Another function of VGAM310 is therefore inhibition of LOC221839 (Accession XM_166506). Accordingly, utilities of VGAM310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221839. LOC92305 (Accession NM_138385) is another VGAM310 host target gene. LOC92305 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92305, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC92305 BINDING SITE, designated SEQ ID:28758, to the nucleotide sequence of VGAM310 RNA, herein designated VGAM RNA, also designated SEQ ID:3021.

[16702] Another function of VGAM310 is therefore inhibition of LOC92305 (Accession NM_138385). Accordingly, utilities of VGAM310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92305. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 311 (VGAM311) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16703] VGAM311 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM311 was detected is described hereinabove with reference to Figs. 1–8.

[16704] VGAM311 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pothos Latent Virus. VGAM311 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16705] VGAM311 gene encodes a VGAM311 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM311 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM311 precursor RNA is designated SEQ ID:297, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:297 is located at position 2180 relative to the genome of Pothos Latent Virus.

[16706] VGAM311 precursor RNA folds onto itself, forming VGAM311 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16707] An enzyme complex designated DICER COMPLEX, `dices` the VGAM311 folded precursor RNA into VGAM311 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM311 RNA is designated SEQ ID:3022, and is provided hereinbelow with reference to the sequence listing part.

[16708] VGAM311 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM311 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM311 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[16709] VGAM311 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM311 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM311 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM311 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM311 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[16710] The complementary binding of VGAM311 RNA, herein designated VGAM RNA, to host target binding sites on VGAM311 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM311 host target RNA into VGAM311 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16711] It is appreciated that VGAM311 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM311 host target genes. The mRNA of each one of this plurality of VGAM311 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM311 RNA, herein designated VGAM RNA, and which when bound by VGAM311 RNA causes inhibition of translation of respective one or more VGAM311 host target proteins.

[16712] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM311 gene, herein designated VGAM GENE, on one or more VGAM311 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[16713] It is yet further appreciated that a function of VGAM311 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM311 include diagnosis, prevention and treatment of viral infection by Pothos Latent Virus. Specific functions, and accordingly utilities, of VGAM311 correlate with, and may be deduced from, the identity of the host target genes which VGAM311 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16714] Nucleotide sequences of the VGAM311 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM311 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM311 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM311 are further described hereinbelow with reference to Table 1.

[16715] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM311 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM311 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16716] As mentioned hereinabove with reference to Fig. 1, a function of VGAM311 gene, herein designated VGAM is inhibition of expression of VGAM311 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM311 correlate with, and may be deduced from, the identity of the target genes which VGAM311 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16717] FLJ20276 (Accession NM_017738) is a VGAM311 host target gene. FLJ20276 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20276 BINDING SITE, designated SEQ ID:19329, to the nucleotide sequence of VGAM311 RNA, herein designated VGAM RNA, also designated SEQ ID:3022.

[16718] A function of VGAM311 is therefore inhibition of FLJ20276

(Accession NM_017738). Accordingly, utilities of VGAM311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20276. MIG (Accession NM_002416) is another VGAM311 host target gene. MIG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MIG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIG BINDING SITE, designated SEQ ID:8246, to the nucleotide sequence of VGAM311 RNA, herein designated VGAM RNA, also designated SEQ ID:3022.

[16719] Another function of VGAM311 is therefore inhibition of MIG (Accession NM_002416). Accordingly, utilities of VGAM311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIG. PLPL (Accession NM_020181) is another VGAM311 host target gene. PLPL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLPL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLPL BINDING SITE, designated SEQ ID:21398,

to the nucleotide sequence of VGAM311 RNA, herein designated VGAM RNA, also designated SEQ ID:3022.

[16720] Another function of VGAM311 is therefore inhibition of PLPL (Accession NM_020181). Accordingly, utilities of VGAM311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLPL. Small EDRK-rich Factor 1B (centromeric) (SERF1B, Accession NM_022978) is another VGAM311 host target gene. SERF1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SERF1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERF1B BINDING SITE, designated SEQ ID:23257, to the nucleotide sequence of VGAM311 RNA, herein designated VGAM RNA, also designated SEQ ID:3022.

[16721] Another function of VGAM311 is therefore inhibition of Small EDRK-rich Factor 1B (centromeric) (SERF1B, Accession NM_022978). Accordingly, utilities of VGAM311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERF1B. Wingless-type MMTV Integration Site Family, Member 2B (WNT2B, Acces-

sion NM_024494) is another VGAM311 host target gene. WNT2B BINDING SITE1 and WNT2B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WNT2B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT2B BINDING SITE1 and WNT2B BINDING SITE2, designated SEQ ID:23695 and SEQ ID:10394 respectively, to the nucleotide sequence of VGAM311 RNA, herein designated VGAM RNA, also designated SEQ ID:3022.

[16722] Another function of VGAM311 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 2B (WNT2B, Accession NM_024494). Accordingly, utilities of VGAM311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT2B. LOC203292 (Accession XM_117527) is another VGAM311 host target gene. LOC203292 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203292, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203292 BINDING

SITE, designated SEQ ID:43502, to the nucleotide sequence of VGAM311 RNA, herein designated VGAM RNA, also designated SEQ ID:3022.

[16723] Another function of VGAM311 is therefore inhibition of LOC203292 (Accession XM_117527). Accordingly, utilities of VGAM311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203292. LOC91813 (Accession XM_040862) is another VGAM311 host target gene. LOC91813 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91813 BINDING SITE, designated SEQ ID:33397, to the nucleotide sequence of VGAM311 RNA, herein designated VGAM RNA, also designated SEQ ID:3022.

[16724] Another function of VGAM311 is therefore inhibition of LOC91813 (Accession XM_040862). Accordingly, utilities of VGAM311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91813. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 312 (VGAM312) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16725] VGAM312 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM312 was detected is described hereinabove with reference to Figs. 1–8.

[16726] VGAM312 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pothos Latent Virus. VGAM312 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16727] VGAM312 gene encodes a VGAM312 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM312 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM312 precursor RNA is designated SEQ ID:298, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:298 is located at position 791 relative to the genome of Pothos

Latent Virus.

[16728] VGAM312 precursor RNA folds onto itself, forming VGAM312 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16729] An enzyme complex designated DICER COMPLEX, `dices` the VGAM312 folded precursor RNA into VGAM312 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM312 RNA is designated SEQ ID:3023, and is provided hereinbelow with reference to the sequence listing part.

[16730] VGAM312 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM312 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM312 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[16731] VGAM312 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM312 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM312 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM312 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM312 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16732] The complementary binding of VGAM312 RNA, herein designated VGAM RNA, to host target binding sites on VGAM312 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM312 host target RNA into VGAM312 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16733] It is appreciated that VGAM312 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM312 host target genes. The mRNA of each one of this plurality of VGAM312 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM312 RNA, herein designated VGAM RNA, and which when bound by VGAM312 RNA causes inhibition of translation of respective one or more VGAM312 host target proteins.

[16734] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM312 gene, herein designated VGAM GENE, on one or more VGAM312 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16735] It is yet further appreciated that a function of VGAM312 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM312 include diagnosis, prevention and treatment of viral infection by Pothos Latent Virus. Specific functions, and accordingly utilities, of VGAM312 correlate

with, and may be deduced from, the identity of the host target genes which VGAM312 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16736] Nucleotide sequences of the VGAM312 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM312 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM312 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM312 are further described hereinbelow with reference to Table 1.

[16737] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM312 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM312 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16738] As mentioned hereinabove with reference to Fig. 1, a function of VGAM312 gene, herein designated VGAM is inhibition of expression of VGAM312 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM312 correlate with, and may be deduced

from, the identity of the target genes which VGAM312 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16739] D8S2298E (Accession NM_005671) is a VGAM312 host target gene. D8S2298E BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by D8S2298E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of D8S2298E BINDING SITE, designated SEQ ID:12230, to the nucleotide sequence of VGAM312 RNA, herein designated VGAM RNA, also designated SEQ ID:3023.

[16740] A function of VGAM312 is therefore inhibition of D8S2298E (Accession NM_005671). Accordingly, utilities of VGAM312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with D8S2298E. LOC149182 (Accession XM_097605) is another VGAM312 host target gene. LOC149182 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC149182 BINDING SITE, designated SEQ ID:40968, to the nucleotide sequence of VGAM312 RNA, herein designated VGAM RNA, also designated SEQ ID:3023.

[16741] Another function of VGAM312 is therefore inhibition of LOC149182 (Accession XM_097605). Accordingly, utilities of VGAM312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149182. LOC51301 (Accession NM_016591) is another VGAM312 host target gene. LOC51301 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51301 BINDING SITE, designated SEQ ID:18673, to the nucleotide sequence of VGAM312 RNA, herein designated VGAM RNA, also designated SEQ ID:3023.

[16742] Another function of VGAM312 is therefore inhibition of LOC51301 (Accession NM_016591). Accordingly, utilities of VGAM312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51301. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 313 (VGAM313) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16743] VGAM313 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM313 was detected is described hereinabove with reference to Figs. 1–8.

[16744] VGAM313 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Porcine Enteric Calicivirus. VGAM313 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16745] VGAM313 gene encodes a VGAM313 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM313 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM313 precursor RNA is designated SEQ ID:299, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:299 is

located at position 2578 relative to the genome of Porcine Enteric Calicivirus.

[16746] VGAM313 precursor RNA folds onto itself, forming VGAM313 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16747] An enzyme complex designated DICER COMPLEX, `dices` the VGAM313 folded precursor RNA into VGAM313 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM313 RNA is designated SEQ ID:3024, and is provided hereinbelow with reference to the sequence listing part.

[16748] VGAM313 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM313 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM313 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[16749] VGAM313 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM313 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM313 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM313 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM313 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[16750] The complementary binding of VGAM313 RNA, herein designated VGAM RNA, to host target binding sites on VGAM313 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM313 host target RNA into VGAM313 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16751] It is appreciated that VGAM313 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM313 host target genes. The mRNA of each one of this plurality of VGAM313 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM313 RNA, herein designated VGAM RNA, and which when bound by VGAM313 RNA causes inhibition of translation of respective one or more VGAM313

host target proteins.

[16752] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM313 gene, herein designated VGAM GENE, on one or more VGAM313 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16753] It is yet further appreciated that a function of VGAM313 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of viral infection by Porcine Enteric Calicivirus.

Specific functions, and accordingly utilities, of VGAM313 correlate with, and may be deduced from, the identity of the host target genes which VGAM313 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16754] Nucleotide sequences of the VGAM313 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM313 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM313 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM313 are further described hereinbelow with reference to Table 1.

[16755] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM313 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM313 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16756] As mentioned hereinabove with reference to Fig. 1, a function of VGAM313 gene, herein designated VGAM is inhibition of expression of VGAM313 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM313 correlate with, and may be deduced from, the identity of the target genes which VGAM313 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16757] PIAS3 (Accession NM_006099) is a VGAM313 host target gene. PIAS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIAS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIAS3 BINDING SITE, designated SEQ ID:12744, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:3024.

[16758] A function of VGAM313 is therefore inhibition of PIAS3 (Accession NM_006099), a gene which specifically inhibits activated stat3 signaling by blocking its dna-binding activity. Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIAS3. The function of PIAS3 has been established by previous studies. STAT proteins (e.g., STAT1, 600555) are latent cytoplasmic transcription factors that become activated by tyrosine phosphorylation in response to cytokine stimulation. Using PIAS1 (OMIM Ref.

No. 603566), an inhibitor of activated STAT1, for EST database searches and cDNA library screening, Chung et al. (1997) identified PIAS3, an inhibitor of activated STAT3 (OMIM Ref. No. 102582). They found that PIAS3 has a molecular mass of about 68 kD. Ueki et al. (1999) independently isolated a PIAS3 cDNA encoding a deduced 619-amino acid protein that shares 83% sequence identity with mouse Pias3. PIAS3 also shares approximately 55% identity with PIAS1 and the PIASX proteins (OMIM Ref. No. 603567) and 39% identity with PIASY (OMIM Ref. No. 605989). Northern blot analysis detected wide expression of PIAS3 in human tissues Ueki et al. (1999) identified PIAS3 as an inhibitor of activated STAT3. Levy et al. (2002) found that PIAS3 binds microphthalmia-associated transcription factor (MITF; 156845), a key DNA-binding protein, in rat basophilic leukemia cells and mouse melanocytes. They observed direct binding of MITF by PIAS3 in coimmunoprecipitation and in vitro pull-down assays. Gel-shift assays showed that PIAS3 can block MITF DNA-binding activity, and cotransfection of MITF and PIAS3 in NIH 3T3 cells inhibited MITF-driven transcription activity. Interaction between PIAS3 and MITF was independent of STAT3 binding

- [16759] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [16760] Chung, C. D.; Liao, J.; Liu, B.; Rao, X.; Jay, P.; Berta, P.; Shuai, K. : Specific inhibition of Stat3 signal transduction by PIAS3. *Science* 278: 1803–1805, 1997. ; and
- [16761] Ueki, N.; Seki, N.; Yano, K.; Saito, T.; Masuho, Y.; Muramatsu, M. : Isolation and chromosomal assignment of a human gene encoding protein inhibitor of activated STAT3 (PIAS3). *J. Hum. Gene.*
- [16762] Further studies establishing the function and utilities of PIAS3 are found in John Hopkins OMIM database record ID 605987, and in cited publications numbered 234 and 4110–4111 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.
- Chromosome 20 Open Reading Frame 139 (C20orf139, Accession XM_097749) is another VGAM313 host target gene. C20orf139 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C20orf139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf139 BINDING

SITE, designated SEQ ID:41106, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:3024.

[16763] Another function of VGAM313 is therefore inhibition of Chromosome 20 Open Reading Frame 139 (C20orf139, Accession XM_097749). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf139.

FLJ13322 (Accession NM_024722) is another VGAM313 host target gene. FLJ13322 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ13322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13322 BINDING SITE, designated SEQ ID:24060, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:3024.

[16764] Another function of VGAM313 is therefore inhibition of FLJ13322 (Accession NM_024722). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13322. KIAA0293 (Accession XM_027045) is another VGAM313

host target gene. KIAA0293 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0293, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0293 BINDING SITE, designated SEQ ID:30395, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:3024.

[16765] Another function of VGAM313 is therefore inhibition of KIAA0293 (Accession XM_027045). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0293. Neuropilin (NRP) and Tolloid (TLL)-like 1 (NETO1, Accession NM_138966) is another VGAM313 host target gene. NETO1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NETO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NETO1 BINDING SITE, designated SEQ ID:29069, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ

ID:3024.

[16766] Another function of VGAM313 is therefore inhibition of Neuropilin (NRP) and Tolloid (TLL)-like 1 (NETO1, Accession NM_138966). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NETO1. LOC147229 (Accession XM_085742) is another VGAM313 host target gene. LOC147229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147229 BINDING SITE, designated SEQ ID:38315, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:3024.

[16767] Another function of VGAM313 is therefore inhibition of LOC147229 (Accession XM_085742). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147229. LOC149837 (Accession XM_097747) is another VGAM313 host target gene. LOC149837 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC149837, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149837 BINDING SITE, designated SEQ ID:41096, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:3024.

[16768] Another function of VGAM313 is therefore inhibition of LOC149837 (Accession XM_097747). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149837. LOC154214 (Accession XM_087876) is another VGAM313 host target gene. LOC154214 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154214, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154214 BINDING SITE, designated SEQ ID:39467, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:3024.

[16769] Another function of VGAM313 is therefore inhibition of LOC154214 (Accession XM_087876). Accordingly, utilities

of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154214. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 314 (VGAM314) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16770] VGAM314 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM314 was detected is described hereinabove with reference to Figs. 1–8.

[16771] VGAM314 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine Adenovirus A. VGAM314 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16772] VGAM314 gene encodes a VGAM314 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM314 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM314 precursor RNA is designated SEQ ID:300, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:300 is located at position 20841 relative to the genome of Murine Adenovirus A.

[16773] VGAM314 precursor RNA folds onto itself, forming VGAM314 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16774] An enzyme complex designated DICER COMPLEX, `dices` the VGAM314 folded precursor RNA into VGAM314 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM314 RNA is designated SEQ ID:3025, and

is provided hereinbelow with reference to the sequence listing part.

[16775] VGAM314 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM314 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM314 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[16776] VGAM314 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM314 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM314 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM314 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM314 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16777] The complementary binding of VGAM314 RNA, herein designated VGAM RNA, to host target binding sites on VGAM314 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM314 host target RNA into VGAM314 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16778] It is appreciated that VGAM314 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM314 host target genes. The mRNA of each one of this plurality of VGAM314 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM314 RNA, herein designated VGAM RNA, and which when bound by VGAM314 RNA causes inhibition of translation of respective one or more VGAM314 host target proteins.

[16779] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM314 gene, herein designated VGAM GENE, on one or more VGAM314 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16780] It is yet further appreciated that a function of VGAM314 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of viral infection by Murine Adenovirus A. Specific functions, and accordingly utilities, of VGAM314 correlate with, and may be deduced from, the identity of the host target genes which VGAM314 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16781] Nucleotide sequences of the VGAM314 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM314 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM314 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM314 are further described hereinbelow with reference to Table 1.

[16782] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM314 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM314 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16783] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM314 gene, herein designated VGAM is inhibition of expression of VGAM314 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM314 correlate with, and may be deduced from, the identity of the target genes which VGAM314 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16784] Male-specific Lethal 3-like 1 (Drosophila) (MSL3L1, Accession NM_006800) is a VGAM314 host target gene. MSL3L1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MSL3L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSL3L1 BINDING SITE, designated SEQ ID:13671, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:3025.

[16785] A function of VGAM314 is therefore inhibition of Male-specific Lethal 3-like 1 (Drosophila) (MSL3L1, Accession NM_006800). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSL3L1. Metal-regulatory

Transcription Factor 1 (MTF1, Accession NM_005955) is another VGAM314 host target gene. MTF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTF1 BINDING SITE, designated SEQ ID:12581, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:3025.

[16786] Another function of VGAM314 is therefore inhibition of Metal-regulatory Transcription Factor 1 (MTF1, Accession NM_005955). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTF1. Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM_005063) is another VGAM314 host target gene. SCD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCD BINDING SITE, designated SEQ ID:11490, to the nucleotide se-

quence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:3025.

[16787] Another function of VGAM314 is therefore inhibition of Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM_005063), a gene which functions in the synthesis of unsaturated fatty acids. Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCD. The function of SCD has been established by previous studies. Stearoyl-CoA desaturase (SCD; EC 1.14.99.5) is an iron-containing enzyme that catalyzes a rate-limiting step in the synthesis of unsaturated fatty acids. The principal product of SCD is oleic acid, which is formed by desaturation of stearic acid. The ratio of stearic acid to oleic acid has been implicated in the regulation of cell growth and differentiation through effects on cell-membrane fluidity and signal transduction (Zhang et al. (1999)). Thiede et al. (1986) isolated cDNAs encoding rat SCD. By RT-PCR of adipose tissue RNA with primers based on the sequence of rat SCD, Li et al. (1994) isolated a partial human SCD cDNA. Using RNase protection assays, the authors found that human SCD was expressed at higher levels in colon and esophageal carcinomas than in the counterpart nor-

mal tissues. Animal model experiments lend further support to the function of SCD. SCD is a central lipogenic enzyme catalyzing the synthesis of monounsaturated fatty acids, mainly oleate (C18:1) and palmitoleate (C16:1), which are components of membrane phospholipids, triglycerides, wax esters, and cholesterol esters. Several SCD isoforms (SCD1, -2, and -3) exist in the mouse. Ntambi et al. (2002) showed that mice with a targeted disruption of the SCD1 isoform had reduced body adiposity, increased insulin (OMIM Ref. No. 176730) sensitivity, and resistance to diet-induced weight gain. The protection from obesity involved increased energy expenditure and increased oxygen consumption. Compared with wild-type mice, the SCD1-/- mice had increased levels of plasma ketone bodies but reduced levels of plasma insulin and leptin. In these homozygous null mice, the expression of several genes of lipid oxidation was upregulated, whereas lipid synthesis genes were downregulated. These observations suggested that a consequence of SCD1 deficiency is an activation of lipid oxidation in addition to reduced triglyceride synthesis and storage.

[16788] It is appreciated that the abovementioned animal model for SCD is acknowledged by those skilled in the art as a

scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[16789] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16790] Ntambi, J. M.; Miyazaki, M.; Stoeckl, J. P.; Lan, H.; Kendziora, C. M.; Yandell, B. S.; Song, Y.; Cohen, P.; Friedman, J. M.; Attie, A. D. : Loss of stearoyl-CoA desaturase-1 function protects mice against adiposity. Proc. Nat. Acad. Sci. 99: 11482–11486, 2002. ; and

[16791] Zhang, L.; Ge, L.; Parimoo, S.; Stenn, K.; Prouty, S. M. : Human stearoyl-CoA desaturase: alternative transcripts generated from a single gene by usage of tandem polyadenylation sites.

[16792] Further studies establishing the function and utilities of SCD are found in John Hopkins OMIM database record ID 604031, and in cited publications numbered 317 and 7635–7639 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 26, Member 3 (SLC26A3, Accession NM_000111) is another VGAM314 host target gene. SLC26A3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by

SLC26A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC26A3 BINDING SITE, designated SEQ ID:5576, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:3025.

[16793] Another function of VGAM314 is therefore inhibition of Solute Carrier Family 26, Member 3 (SLC26A3, Accession NM_000111). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A3. Staufen, RNA Binding Protein, Homolog 2 (Drosophila) (STAU2, Accession NM_014393) is another VGAM314 host target gene. STAU2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by STAU2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAU2 BINDING SITE, designated SEQ ID:15722, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:3025.

[16794] Another function of VGAM314 is therefore inhibition of Staufen, RNA Binding Protein, Homolog 2 (Drosophila) (STAU2, Accession NM_014393). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAU2. Transient Receptor Potential Cation Channel, Subfamily M, Member 6 (TRPM6, Accession NM_017662) is another VGAM314 host target gene. TRPM6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPM6 BINDING SITE, designated SEQ ID:19201, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:3025.

[16795] Another function of VGAM314 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily M, Member 6 (TRPM6, Accession NM_017662), a gene which contains a predicted ion channel domain and a protein kinase domain. Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM6. The function of

TRPM6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173.DKFZP564O0423 (Accession XM_166254) is another VGAM314 host target gene. DKFZP564O0423 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564O0423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O0423 BINDING SITE, designated SEQ ID:44064, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:3025.

[16796] Another function of VGAM314 is therefore inhibition of DKFZP564O0423 (Accession XM_166254). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O0423. FLJ10688 (Accession NM_018179) is another VGAM314 host target gene. FLJ10688 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10688, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10688 BINDING SITE, designated SEQ ID:20013, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:3025.

[16797] Another function of VGAM314 is therefore inhibition of FLJ10688 (Accession NM_018179). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10688. FLJ12960 (Accession NM_024638) is another VGAM314 host target gene. FLJ12960 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12960 BINDING SITE, designated SEQ ID:23917, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:3025.

[16798] Another function of VGAM314 is therefore inhibition of FLJ12960 (Accession NM_024638). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12960.

KIAA1668 (Accession XM_039236) is another VGAM314 host target gene. KIAA1668 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1668, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1668 BINDING SITE, designated SEQ ID:33027, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:3025.

[16799] Another function of VGAM314 is therefore inhibition of KIAA1668 (Accession XM_039236). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1668. MAD4 (Accession NM_006454) is another VGAM314 host target gene. MAD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAD4 BINDING SITE, designated SEQ ID:13171, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3025.

[16800] Another function of VGAM314 is therefore inhibition of MAD4 (Accession NM_006454). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAD4. MGC4643 (Accession NM_032715) is another VGAM314 host target gene. MGC4643 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4643, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4643 BINDING SITE, designated SEQ ID:26440, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:3025.

[16801] Another function of VGAM314 is therefore inhibition of MGC4643 (Accession NM_032715). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4643. WIRE (Accession XM_085731) is another VGAM314 host target gene. WIRE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WIRE, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WIRE BINDING SITE, designated SEQ ID:38314, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:3025.

[16802] Another function of VGAM314 is therefore inhibition of WIRE (Accession XM_085731). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WIRE. LOC125988 (Accession XM_058957) is another VGAM314 host target gene. LOC125988 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC125988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC125988 BINDING SITE, designated SEQ ID:36803, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:3025.

[16803] Another function of VGAM314 is therefore inhibition of LOC125988 (Accession XM_058957). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC125988. LOC143451 (Accession XM_084521) is another VGAM314 host target gene. LOC143451 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143451, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143451 BINDING SITE, designated SEQ ID:37621, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:3025.

[16804] Another function of VGAM314 is therefore inhibition of LOC143451 (Accession XM_084521). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143451. LOC145125 (Accession XM_085025) is another VGAM314 host target gene. LOC145125 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145125, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145125 BINDING SITE, designated SEQ ID:37798, to

the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:3025.

[16805] Another function of VGAM314 is therefore inhibition of LOC145125 (Accession XM_085025). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145125. LOC148109 (Accession XM_086047) is another VGAM314 host target gene. LOC148109 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148109, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148109 BINDING SITE, designated SEQ ID:38463, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:3025.

[16806] Another function of VGAM314 is therefore inhibition of LOC148109 (Accession XM_086047). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148109. LOC148696 (Accession XM_097505) is another VGAM314 host target gene. LOC148696 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC148696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148696 BINDING SITE, designated SEQ ID:40893, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:3025.

[16807] Another function of VGAM314 is therefore inhibition of LOC148696 (Accession XM_097505). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148696. LOC149506 (Accession XM_097661) is another VGAM314 host target gene. LOC149506 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149506, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149506 BINDING SITE, designated SEQ ID:41009, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:3025.

[16808] Another function of VGAM314 is therefore inhibition of LOC149506 (Accession XM_097661). Accordingly, utilities

of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149506. LOC254440 (Accession XM_173126) is another VGAM314 host target gene. LOC254440 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254440, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254440 BINDING SITE, designated SEQ ID:46375, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:3025.

[16809] Another function of VGAM314 is therefore inhibition of LOC254440 (Accession XM_173126). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254440. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 315 (VGAM315) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16810] VGAM315 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM315 was detected is described hereinabove with reference to Figs. 1–8.

[16811] VGAM315 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 3. VGAM315 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16812] VGAM315 gene encodes a VGAM315 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM315 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM315 precursor RNA is designated SEQ ID:301, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:301 is located at position 1554 relative to the genome of Cryphonectria Hypovirus 3.

[16813] VGAM315 precursor RNA folds onto itself, forming VGAM315 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16814] An enzyme complex designated DICER COMPLEX, `dices` the VGAM315 folded precursor RNA into VGAM315 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM315 RNA is designated SEQ ID:3026, and is provided hereinbelow with reference to the sequence listing part.

[16815] VGAM315 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM315 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM315 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[16816] VGAM315 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM315 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM315 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM315 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM315 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16817] The complementary binding of VGAM315 RNA, herein designated VGAM RNA, to host target binding sites on VGAM315 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM315 host target RNA into VGAM315 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16818] It is appreciated that VGAM315 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM315 host target genes. The mRNA of each one of this plurality of VGAM315 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM315 RNA, herein designated VGAM RNA, and which when bound by VGAM315 RNA causes inhibition of translation of respective one or more VGAM315 host target proteins.

[16819] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM315 gene, herein designated VGAM GENE, on one or more VGAM315 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16820] It is yet further appreciated that a function of VGAM315 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM315 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 3. Specific functions, and accordingly utilities, of VGAM315 correlate with, and may be deduced from, the identity of the host target genes which VGAM315 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16821] Nucleotide sequences of the VGAM315 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM315 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM315 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM315 are further
described hereinbelow with reference to Table 1.

[16822] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM315 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM315 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[16823] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM315 gene, herein designated VGAM is
inhibition of expression of VGAM315 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM315 correlate with, and may be deduced
from, the identity of the target genes which VGAM315
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[16824] G Protein-coupled Receptor, Family C, Group 5, Member B
(GPRC5B, Accession NM_016235) is a VGAM315 host tar-

get gene. GPRC5B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPRC5B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPRC5B BINDING SITE, designated SEQ ID:18352, to the nucleotide sequence of VGAM315 RNA, herein designated VGAM RNA, also designated SEQ ID:3026.

[16825] A function of VGAM315 is therefore inhibition of G Protein-coupled Receptor, Family C, Group 5, Member B (GPRC5B, Accession NM_016235), a gene which belongs to G protein-coupled receptor. Accordingly, utilities of VGAM315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPRC5B. The function of GPRC5B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM131. Interleukin 20 Receptor, Alpha (IL20RA, Accession NM_014432) is another VGAM315 host target gene. IL20RA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL20RA, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL20RA BINDING SITE, designated SEQ ID:15791, to the nucleotide sequence of VGAM315 RNA, herein designated VGAM RNA, also designated SEQ ID:3026.

[16826] Another function of VGAM315 is therefore inhibition of Interleukin 20 Receptor, Alpha (IL20RA, Accession NM_014432), a gene which is the receptor for interleukin-20 . Accordingly, utilities of VGAM315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL20RA. The function of IL20RA has been established by previous studies. Blumberg et al. (2001) identified the receptor for interleukin-20 (IL20; 605619) as a heterodimer of 2 orphan class II cytokine receptor subunits, IL20RA, also called ZCYTOR7, and IL20RB (OMIM Ref. No. 605621), also called DIRS1. Binding assays using radiolabeled ligand demonstrated that IL20 bound to BHK transfectants expressing both IL20RA and IL20RB, but not to untransfected cells nor to transfectants expressing either receptor subunit alone. Binding of (125)I-labeled IL20 was eliminated in the presence of 100-fold excess of unlabeled IL20 but not in the presence

of 100-fold excess of the unrelated cytokine, IL21 (OMIM Ref. No. 605384). The binding data revealed 88,000 IL20 receptors per cell, with a binding affinity of approximately 1.5 nM. Both receptor subunits were expressed in skin and were dramatically upregulated in psoriatic skin. Scott (2001) mapped the IL20RA gene to 6q23 based on sequence similarity between the IL20RA sequence (GenBank AF184971) and a genomic contig (GenBank NT_025741.1).

[16827] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16828] Blumberg, H.; Conklin, D.; Xu, W.; Grossmann, A.; Brender, T.; Carollo, S.; Eagan, M.; Foster, D.; Haldeman, B. A.; Hammond, A.; Haugen, H.; Jelinek, L.; and 14 others : Interleukin 20: discovery, receptor identification, and role in epidermal function. Cell 104: 9–19, 2001. ; and

[16829] Scott, A. F. : Personal Communication. Baltimore, Md., 3/13/2001.

[16830] Further studies establishing the function and utilities of IL20RA are found in John Hopkins OMIM database record ID 605620, and in cited publications numbered 443 and 7005 listed in the bibliography section hereinbelow, which

are also hereby incorporated by reference. Microtubule-associated Protein 1A (MAP1A, Accession NM_002373) is another VGAM315 host target gene. MAP1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP1A BINDING SITE, designated SEQ ID:8184, to the nucleotide sequence of VGAM315 RNA, herein designated VGAM RNA, also designated SEQ ID:3026.

[16831] Another function of VGAM315 is therefore inhibition of Microtubule-associated Protein 1A (MAP1A, Accession NM_002373), a gene which is a structural protein involved in the filamentous cross-bridging between microtubules and other skeletal elements. Accordingly, utilities of VGAM315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP1A. The function of MAP1A has been established by previous studies. Ikeda et al. (2002) identified the MAP1A gene as the 'modifier of tubby hearing-1' (moth1) QTL associated with hearing loss in tubby mutants on the C57BL/6J back-

ground. The Map1a cDNA derived from B6 contained 12 single-nucleotide differences which could lead to amino acid alterations and a difference in the length of a repeat in the open reading frame when compared with that found in the AKR strain. Ikeda et al. (2002) used a transgenic rescue experiment to verify that sequence polymorphisms were crucial for hearing loss phenotype and demonstrated that the polymorphisms changed the binding efficiency of MAP1A to PSD95 (OMIM Ref. No. 602887), a core component in the cytoarchitecture of synapses. This indicates that at least some of the observed polymorphisms are functionally important and that the hearing loss of C57BL/6J-tub/tub mice may be caused by impaired protein interactions involving MTAP1A. Lien et al. (1994) completely cloned and sequenced the human MAP1B gene. By comparison of human MAP1B with sequence databases, they identified a MAP1B-related gene that is probably the human homolog of rat MAP1A. The human MAP1A gene is expressed at high levels in brain and spinal cord and at much lower levels in muscle.

[16832] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [16833] Ikeda, A.; Zheng, Q. Y.; Zuberi, A. R.; Johnson, K. R.; Nagert, J. K.; Nishina, P. M. : Microtubule-associated protein 1A is a modifier of tubby hearing (moth1). *Nature Genet.* 30: 401–405, 2002. ; and
- [16834] Lien, L. L.; Feener, C. A.; Fischbach, N.; Kunkel, L. M. : Cloning of human microtubule-associated protein 1B and the identification of a related gene on chromosome 15. *Genomics* 22: 273–28.
- [16835] Further studies establishing the function and utilities of MAP1A are found in John Hopkins OMIM database record ID 600178, and in cited publications numbered 8783, 1074 and 10749 listed in the bibliography section herein–below, which are also hereby incorporated by reference. Vacuolar Protein Sorting 26 (yeast) (VPS26, Accession NM_004896) is another VGAM315 host target gene. VPS26 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VPS26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VPS26 BINDING SITE, designated SEQ ID:11326, to the nucleotide sequence of VGAM315 RNA, herein designated VGAM RNA, also designated SEQ ID:3026.

[16836] Another function of VGAM315 is therefore inhibition of Vacuolar Protein Sorting 26 (yeast) (VPS26, Accession NM_004896), a gene which is a sorting protein– ensures the proper delivery of organelle–specific proteins. Accordingly, utilities of VGAM315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS26. The function of VPS26 has been established by previous studies. Haft et al. (2000) used yeast 2–hybrid assays, mutation analysis, and expression in mammalian cells to define the binding interactions among VPS26 and other human orthologs of yeast vacuolar protein sorting proteins, VPS29 (OMIM Ref. No. 606932), SNX1 (OMIM Ref. No. 601272), and VPS35 (OMIM Ref. No. 606931). Their results are consistent with a model in which VPS26 is bound to VPS35 in a multimeric complex. Haft et al. (2000) identified a discrete domain within VPS35 that interacts with VPS26. Gel filtration chromatography of COS–7 cells showed that both recombinant and endogenous VPS proteins coelute as a 220– to 240–kD complex, and in the absence of VPS35, neither VPS26 nor VPS29 is found in the complex. By database searching with the *S. cerevisiae* and mouse Vps26p/HB58/PEP8 sequences as probe, Haft et al. (2000) identified a human

VPS26 EST. The deduced 327–amino acid protein was predicted to be a soluble protein. Northern blot analysis of multiple human tissues revealed ubiquitous expression of a single transcript of about 3 kb. Highest expression was found in heart, skeletal muscle, kidney, liver, and placenta, with lower expression in brain, spleen, small intestine, and lung, and lowest expression in colon, thymus, and leukocytes.

[16837] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16838] Haft, C. R.; de la Luz Sierra, M.; Bafford, R.; Lesniak, M. A.; Barr, V. A.; Taylor, S. I. : Human orthologs of yeast vacuolar protein sorting proteins Vps26, 29, and 35: assembly into multimeric complexes. *Molec. Biol. Cell* 11: 4105–4116, 2000. ; and

[16839] Mao, M.; Fu, G.; Wu, J.–S.; Zhang, Q.–H.; Zhou, J.; Kan, L.–X.; Huang, Q.–H.; He, K.–L.; Gu, B.–W.; Han, Z.–G.; Shen, Y.; Gu, J.; Yu, Y.–P.; Xu, S.–H.; Wang, Y.–X.; Chen, S.–J.; Chen.

[16840] Further studies establishing the function and utilities of VPS26 are found in John Hopkins OMIM database record ID 605506, and in cited publications numbered 449 and

8801 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cadherin-like 22 (CDH22, Accession NM_021248) is another VGAM315 host target gene. CDH22 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CDH22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH22 BINDING SITE, designated SEQ ID:22215, to the nucleotide sequence of VGAM315 RNA, herein designated VGAM RNA, also designated SEQ ID:3026.

[16841] Another function of VGAM315 is therefore inhibition of Cadherin-like 22 (CDH22, Accession NM_021248). Accordingly, utilities of VGAM315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH22. LOC124930 (Accession XM_058867) is another VGAM315 host target gene. LOC124930 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC124930 BINDING SITE, designated SEQ ID:36769, to the nucleotide sequence of VGAM315 RNA, herein designated VGAM RNA, also designated SEQ ID:3026.

[16842] Another function of VGAM315 is therefore inhibition of LOC124930 (Accession XM_058867). Accordingly, utilities of VGAM315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124930. LOC130074 (Accession XM_072228) is another VGAM315 host target gene. LOC130074 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130074 BINDING SITE, designated SEQ ID:37474, to the nucleotide sequence of VGAM315 RNA, herein designated VGAM RNA, also designated SEQ ID:3026.

[16843] Another function of VGAM315 is therefore inhibition of LOC130074 (Accession XM_072228). Accordingly, utilities of VGAM315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130074. LOC133584 (Accession XM_059661) is another VGAM315 host target gene. LOC133584 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC133584, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133584 BINDING SITE, designated SEQ ID:37046, to the nucleotide sequence of VGAM315 RNA, herein designated VGAM RNA, also designated SEQ ID:3026.

[16844] Another function of VGAM315 is therefore inhibition of LOC133584 (Accession XM_059661). Accordingly, utilities of VGAM315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133584. LOC145216 (Accession XM_096730) is another VGAM315 host target gene. LOC145216 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145216, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145216 BINDING SITE, designated SEQ ID:40506, to the nucleotide sequence of VGAM315 RNA, herein designated VGAM RNA, also designated SEQ ID:3026.

[16845] Another function of VGAM315 is therefore inhibition of

LOC145216 (Accession XM_096730). Accordingly, utilities of VGAM315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145216. LOC199232 (Accession XM_114336) is another VGAM315 host target gene. LOC199232 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199232, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199232 BINDING SITE, designated SEQ ID:42880, to the nucleotide sequence of VGAM315 RNA, herein designated VGAM RNA, also designated SEQ ID:3026.

[16846] Another function of VGAM315 is therefore inhibition of LOC199232 (Accession XM_114336). Accordingly, utilities of VGAM315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199232. LOC200933 (Accession XM_117294) is another VGAM315 host target gene. LOC200933 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200933, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC200933 BINDING SITE, designated SEQ ID:43362, to the nucleotide sequence of VGAM315 RNA, herein designated VGAM RNA, also designated SEQ ID:3026.

[16847] Another function of VGAM315 is therefore inhibition of LOC200933 (Accession XM_117294). Accordingly, utilities of VGAM315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200933. LOC92249 (Accession XM_043814) is another VGAM315 host target gene. LOC92249 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92249, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92249 BINDING SITE, designated SEQ ID:34022, to the nucleotide sequence of VGAM315 RNA, herein designated VGAM RNA, also designated SEQ ID:3026.

[16848] Another function of VGAM315 is therefore inhibition of LOC92249 (Accession XM_043814). Accordingly, utilities of VGAM315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92249. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 316 (VGAM316) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16849] VGAM316 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM316 was detected is described hereinabove with reference to Figs. 1–8.

[16850] VGAM316 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 3. VGAM316 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16851] VGAM316 gene encodes a VGAM316 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM316 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM316 precursor RNA is designated SEQ ID:302, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:302 is

located at position 6108 relative to the genome of Cryphonectria Hypovirus 3.

[16852] VGAM316 precursor RNA folds onto itself, forming VGAM316 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16853] An enzyme complex designated DICER COMPLEX, `dices` the VGAM316 folded precursor RNA into VGAM316 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide sequence of VGAM316 RNA is designated SEQ ID:3027, and is provided hereinbelow with reference to the sequence listing part.

[16854] VGAM316 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM316 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM316 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[16855] VGAM316 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM316 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM316 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM316 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM316 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[16856] The complementary binding of VGAM316 RNA, herein designated VGAM RNA, to host target binding sites on VGAM316 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM316 host target RNA into VGAM316 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16857] It is appreciated that VGAM316 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM316 host target genes. The mRNA of each one of this plurality of VGAM316 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM316 RNA, herein designated VGAM RNA, and which when bound by VGAM316 RNA causes inhibition of translation of respective one or more VGAM316

host target proteins.

[16858] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM316 gene, herein designated VGAM GENE, on one or more VGAM316 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16859] It is yet further appreciated that a function of VGAM316 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 3.

Specific functions, and accordingly utilities, of VGAM316 correlate with, and may be deduced from, the identity of the host target genes which VGAM316 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16860] Nucleotide sequences of the VGAM316 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM316 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM316 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM316 are further described hereinbelow with reference to Table 1.

[16861] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM316 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM316 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16862] As mentioned hereinabove with reference to Fig. 1, a function of VGAM316 gene, herein designated VGAM is inhibition of expression of VGAM316 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM316 correlate with, and may be deduced from, the identity of the target genes which VGAM316 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16863] Adaptor-related Protein Complex 1, Gamma 1 Subunit (AP1G1, Accession NM_001128) is a VGAM316 host target gene. AP1G1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AP1G1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP1G1 BINDING SITE, designated SEQ ID:6800, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16864] A function of VGAM316 is therefore inhibition of Adaptor-related Protein Complex 1, Gamma 1 Subunit (AP1G1, Accession NM_001128), a gene which promotes the formation of clathrin-coated pits and vesicles. Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1G1. The function of AP1G1 has been established by previous studies. Adaptins are important components of

heterotetrameric adaptor complexes (APs) whose role is to promote the formation of clathrin-coated pits and vesicles. The AP-1 adaptor, localized at the trans-Golgi network, is composed of 2 approximately 100-kD subunits, beta-prime-adaptin (OMIM Ref. No. 600157) and gamma-adaptin; 1 medium subunit, AP47 (OMIM Ref. No. 603535); and 1 small subunit, AP19 (OMIM Ref. No. 603531). By screening a human fetal brain library with a mouse gamma-adaptin cDNA, Peyrard et al. (1998) isolated cDNAs encoding human gamma-adaptin. The predicted 825-amino acid protein shares 99% identity with mouse gamma-adaptin. Northern blot analysis revealed that gamma-adaptin was expressed as a 7.5-kb transcript in all human tissues tested. An additional 4.4-kb mRNA was present in most tissues, and an 8.5-kb mRNA was detected in pancreas and peripheral blood leukocytes

[16865] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16866] Doray, B.; Ghosh, P.; Griffith, J.; Geuze, H. J.; Kornfeld, S. : Cooperation of GGAs and AP-1 in packaging MPRs at the trans-Golgi network. Science 297: 1700-1703, 2002. ; and

- [16867] Peyrard, M.; Parveneh, S.; Lagercrantz, S.; Ekman, M.; Fransson, I.; Sahlen, S.; Dumanski, J. P. : Cloning, expression pattern, and chromosomal assignment to 16q23 of the human gamma-a.
- [16868] Further studies establishing the function and utilities of AP1G1 are found in John Hopkins OMIM database record ID 603533, and in cited publications numbered 12596 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cold Autoinflammatory Syndrome 1 (CIAS1, Accession NM_004895) is another VGAM316 host target gene. CIAS1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CIAS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CIAS1 BINDING SITE, designated SEQ ID:11321, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.
- [16869] Another function of VGAM316 is therefore inhibition of Cold Autoinflammatory Syndrome 1 (CIAS1, Accession NM_004895), a gene which may mediate protein-protein interactions; contains a leucine rich repeat. Accordingly,

utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CIAS1. The function of CIAS1 has been established by previous studies. In a positional cloning effort to identify the gene mutated in familial cold autoinflammatory syndrome and Muckle-Wells syndrome, both of which map to 1q44, Hoffman et al. (2001) cloned and characterized the CIAS1 gene, so named for 'cold-induced autoinflammatory syndrome.' The full-length cDNA corresponds to a 9-exon gene encoding an open reading frame of 3,105 basepairs with 2 potential start codons in exon 1, with the second start codon meeting more Kozak criteria, and a stop codon at exon 9. Northern blot analysis identified a broad mRNA band of approximately 4 kb expressed at a low level in peripheral blood leukocytes; little or no expression was detectable in other tissues. Further analysis revealed extensive alternative splicing of exons 4 through 8 that resulted in mRNAs ranging from 3,315 to 4,170 bp, consistent with the Northern blot analysis. The predicted protein encoded by the first splice form of CIAS1 (exons 1-3, 5, and 7-9), called cryopyrin, consists of 920 amino acids with a size of 105.7 kD and a PI of 6.16. The protein sequence contains several distinct motifs including a pyrin

domain in the amino terminus (amino acids 13 through 83), a central nucleotide-binding site (NACHT subfamily) domain in exon 3 (amino acids 217 to 533), and a C-terminal leucine-rich repeat domain containing 7 leucine-rich repeats (amino acids 697 through 920). No nuclear localization signals were identified and no clear trans-membrane regions were found. The largest protein potentially encoded by the 9 exons of CIAS1 consists of 1,034 amino acids with a size of 117.9 kD and 11 C-terminal leucine-rich repeats. Hoffman et al. (2001) suggested that cryopyrin is a signaling protein involved in the regulation of apoptosis. Dode et al. (2002) identified CIAS1 mutations, all located in exon 3, in 9 unrelated families with MWS and in 3 unrelated families with familial cold urticaria (FCU), originating from France, England, and Algeria. Five mutations were novel. The R260W mutation (606416.0005) was identified in 2 families with MWS and in 2 families with FCU, of different ethnic origins, thereby demonstrating that a single CIAS1 mutation may cause both syndromes. This result indicated that modifier genes are involved in determining either an MWS or an FCU phenotype. The finding of the G569R mutation (606416.0006) in asymptomatic individuals further em-

phasized the importance of a modifier gene (or genes) in determining disease phenotype. The authors suggested that identification of modifiers was likely to have significant therapeutic implications for these severe diseases.

[16870] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16871] Dode, C.; Le Du, N.; Cuisset, L.; Letourneur, F.; Berthelot, J.-M.; Vaudour, G.; Meyrier, A.; Watts, R. A.; Scott, D. G. [16873] Further studies establishing the function and utilities of CIAS1 are found in John Hopkins OMIM database record ID 606416, and in cited publications numbered 6762–6763, 120 and 8801 listed in the bibliography section hereinbe–

low, which are also hereby incorporated by reference. Coagulation Factor II (thrombin) Receptor (F2R, Accession NM_001992) is another VGAM316 host target gene. F2R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by F2R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F2R BINDING SITE, designated SEQ ID:7721, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16874] Another function of VGAM316 is therefore inhibition of Coagulation Factor II (thrombin) Receptor (F2R, Accession NM_001992), a gene which Thrombin receptor; G protein-coupled receptor involved in platelet activation. Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F2R. The function of F2R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM140. LIM Domain Kinase 1 (LIMK1, Accession NM_016735) is another VGAM316 host target gene. LIMK1 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by LIMK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIMK1 BINDING SITE, designated SEQ ID:18793, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16875] Another function of VGAM316 is therefore inhibition of LIM Domain Kinase 1 (LIMK1, Accession NM_016735). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIMK1. Microtubule-associated Protein 1B (MAP1B, Accession NM_005909) is another VGAM316 host target gene. MAP1B BINDING SITE1 and MAP1B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAP1B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP1B BINDING SITE1 and MAP1B BINDING SITE2, designated SEQ ID:12535 and SEQ ID:25712 respectively, to the nucleotide sequence of VGAM316 RNA, herein designated

VGAM RNA, also designated SEQ ID:3027.

[16876] Another function of VGAM316 is therefore inhibition of Microtubule-associated Protein 1B (MAP1B, Accession NM_005909), a gene which may have a role in neuronal plasticity and brain development. Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP1B. The function of MAP1B has been established by previous studies. Using a polyclonal antiserum directed against the C-terminal domain of dystrophin, Lien et al. (1991) isolated a cDNA clone encoding an antigenically crossreactive protein, microtubule-associated protein 1B (MAP1B). By in situ hybridization, the gene was mapped to 5q13 in proximity to the spinal muscular atrophy (SMA; 253300) locus. Genetic linkage analysis of SMA families using a human dinucleotide repeat polymorphism just 3-prime of the MAP1B gene has shown tight linkage to SMA mutations. These mapping data, together with the postulated role of MAP1B in neuronal morphogenesis and its localization in anterior horn motor neurons, suggest a possible association with SMA. The maximum lod score between SMA and MAP1B for combined sexes was 20.24 at a recombination fraction of 0.02. The 2 recombinants between MAP1B and

SMA might appear to eliminate the possibility of an etio-logic relationship between MAP1B and SMA. However, there is likely to be nonallelic heterogeneity, particularly among chronic cases of SMA. If MAP1B were indeed the SMA locus, it would be expected to be recombinant in families that have mutations at another locus. MAP1B was found to be the closest marker distal to the locus for SMA; its 5-prime end was oriented toward the centromere (Wirth et al., 1993). Hammarback et al. (1991) found that LC1, one of the 3 light chains that makes up the MAP1B complex, is encoded within the 3-prime end of the MAP1B heavy chain gene. Their data suggested that the heavy chain and light chain 1 are produced by proteolytic processing of a precursor polypeptide. Lien et al. (1994) completely cloned and sequenced the human MAP1B gene. The expressed protein showed 91% overall identity with rat and mouse MAP1B. The gene has 7 exons; the third exon contains sequence not represented in mouse or rat MAP1B. This sequence, labeled 3A, is present at the 5-prime end of an alternative transcript that is expressed at approximately one-tenth the level of the full-length transcript. Neuronal microtubules are considered to have a role in dendrite and axon formation. Different portions

of the developing and adult brain microtubules are associated with different microtubule-associated proteins. MAP1B is expressed in different portions of the brain and may have a role in neuronal plasticity and brain development. Edelman et al. (1996) generated mice that carry an insertion in MAP1B by gene-targeting methods. Mice homozygous for the modification died during embryogenesis. The heterozygotes exhibited a spectrum of phenotypes including slower growth rates, lack of visual acuity in one or both eyes, and motor system abnormalities. Histochemical analysis of the severely affected mice revealed that their Purkinje cell dendritic processes were abnormal, did not react with MAP1B antibodies, and showed reduced staining with MAP1A (OMIM Ref. No. 600178) antibodies. Similar histologic and immunochemical changes were observed in the olfactory bulb, hippocampus, and retina, providing a basis for the observed phenotypes

[16877] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16878] Lien, L. L.; Feener, C. A.; Fischbach, N.; Kunkel, L. M. : Cloning of human microtubule-associated protein 1B and the identification of a related gene on chromosome 15.

Genomics 22: 273–280, 1994. ; and

[16879] Edelmann, W.; Zervas, M.; Costello, P.; Roback. L.; Fischer, I.; Hammarback, J. A.; Cowan, N.; Davies, P.; Wainer, B.; Kucherlapati, R. : Neuronal abnormalities in microtubule-associated pr.

[16880] Further studies establishing the function and utilities of MAP1B are found in John Hopkins OMIM database record ID 157129, and in cited publications numbered 10746–10751 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Matrix Metalloproteinase 25 (MMP25, Accession NM_022468) is another VGAM316 host target gene. MMP25 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MMP25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP25 BINDING SITE, designated SEQ ID:22819, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16881] Another function of VGAM316 is therefore inhibition of Matrix Metalloproteinase 25 (MMP25, Accession

NM_022468). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP25. Myosin IA (MYO1A, Accession NM_005379) is another VGAM316 host target gene. MYO1A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MYO1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYO1A BINDING SITE, designated SEQ ID:11861, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16882] Another function of VGAM316 is therefore inhibition of Myosin IA (MYO1A, Accession NM_005379), a gene which is involved in directing the movement of organelles along actin filaments (potential). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYO1A. The function of MYO1A has been established by previous studies. Myosins are molecular motors that, upon interaction with actin filaments, utilize energy from ATP hydrolysis to generate mechanical force. Phylogenetic analysis of

the myosin motor domains identified 11 distinct classes, 7 of which are expressed in vertebrates (reviewed by Mooseker and Cheney, 1995). These 7 vertebrate myosin classes include conventional myosin (myosin II) and 6 less well characterized unconventional myosin classes, myosins I, V (see OMIM Ref. No. 160777), VI (OMIM Ref. No. 600970), VII (see OMIM Ref. No. 276903), IX, and X (OMIM Ref. No. 601481). Each myosin has a conserved N-terminal motor domain (25 to 40% identical at the amino acid level) that contains both ATP-binding and actin-binding sequences. Following the motor domain is a light-chain-binding 'neck' region containing 1–6 copies of a repeat element, the IQ motif, that serves as a binding site for calmodulin (OMIM Ref. No. 114180) or other members of the EF-hand superfamily of calcium-binding proteins. At the C-terminus, each myosin class has a distinct tail domain that serves in dimerization, membrane binding, protein binding, and/or enzymatic activities and targets each myosin to its particular subcellular location (Hasson et al., 1996). By interspecific mouse backcross mapping, Hasson et al. (1996) localized the Myo1a gene to mouse chromosome 10 which predicted a location of the human homolog on 12q13. By fluorescence in situ hybridization,

they demonstrated that the human MYO1A gene is located on 12q13–q15.

[16883] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[16884] Hasson, T.; Skowron, J. F.; Gilbert, D. J.; Avraham, K. B.; Perry, W. L.; Bement, W. M.; Anderson, B. L.; Sherr, E. H.; Chen, Z.–Y.; Greene, L. A.; Ward, D. C.; Corey, D. P.; Mooseker, M. S.; Copeland, N. G.; Jenkins, N. A. : Mapping of unconventional myosins in mouse and human. *Genomics* 36: 431–439, 1996. ; and

[16885] Mooseker, M. S.; Cheney, R. E. : Unconventional myosins. *Annu. Rev. Cell Dev. Biol.* 11: 633–675, 1995.

[16886] Further studies establishing the function and utilities of MYO1A are found in John Hopkins OMIM database record ID 601478, and in cited publications numbered 7027 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Optic Atrophy 1 (autosomal dominant) (OPA1, Accession NM_130833) is another VGAM316 host target gene. OPA1 BINDING SITE1 through OPA1 BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OPA1, corresponding to HOST TARGET binding sites such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPA1 BINDING SITE1 through OPA1 BINDING SITE5, designated SEQ ID:28326, SEQ ID:28334, SEQ ID:28342, SEQ ID:28350 and SEQ ID:28358 respectively, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16887] Another function of VGAM316 is therefore inhibition of Optic Atrophy 1 (autosomal dominant) (OPA1, Accession NM_130833). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPA1. Chromosome 21 Open Reading Frame 25 (C21orf25, Accession XM_032945) is another VGAM316 host target gene. C21orf25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C21orf25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf25 BINDING SITE, designated SEQ ID:31795, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16888] Another function of VGAM316 is therefore inhibition of Chromosome 21 Open Reading Frame 25 (C21orf25, Accession XM_032945). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf25. Cerebellin 1 Precursor (CBLN1, Accession NM_004352) is another VGAM316 host target gene. CBLN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBLN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBLN1 BINDING SITE, designated SEQ ID:10556, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16889] Another function of VGAM316 is therefore inhibition of Cerebellin 1 Precursor (CBLN1, Accession NM_004352). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBLN1. Cellular Repressor of E1A-stimulated Genes (CREG, Accession NM_003851) is another VGAM316 host target gene. CREG BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by CREG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CREG BINDING SITE, designated SEQ ID:9945, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16890] Another function of VGAM316 is therefore inhibition of Cellular Repressor of E1A-stimulated Genes (CREG, Accession NM_003851). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CREG. FLJ10724 (Accession NM_018194) is another VGAM316 host target gene. FLJ10724 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10724, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10724 BINDING SITE, designated SEQ ID:20051, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16891] Another function of VGAM316 is therefore inhibition of

FLJ10724 (Accession NM_018194). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10724. FLJ14011 (Accession NM_022103) is another VGAM316 host target gene. FLJ14011 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ14011, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14011 BINDING SITE, designated SEQ ID:22648, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16892] Another function of VGAM316 is therefore inhibition of FLJ14011 (Accession NM_022103). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14011. FLJ23510 (Accession NM_024720) is another VGAM316 host target gene. FLJ23510 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23510, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ23510 BINDING SITE, designated SEQ ID:24055, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16893] Another function of VGAM316 is therefore inhibition of FLJ23510 (Accession NM_024720). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23510. Interleukin 1 Receptor Accessory Protein-like 1 (IL1RAPL1, Accession NM_014271) is another VGAM316 host target gene. IL1RAPL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL1RAPL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1RAPL1 BINDING SITE, designated SEQ ID:15550, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16894] Another function of VGAM316 is therefore inhibition of Interleukin 1 Receptor Accessory Protein-like 1 (IL1RAPL1, Accession NM_014271). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with IL1RAPL1.

KIAA0455 (Accession XM_051785) is another VGAM316 host target gene. KIAA0455 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0455, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0455 BINDING SITE, designated SEQ ID:35882, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16895] Another function of VGAM316 is therefore inhibition of KIAA0455 (Accession XM_051785). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0455. KIAA0945 (Accession NM_014952) is another VGAM316 host target gene. KIAA0945 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0945 BINDING SITE, designated SEQ ID:17289, to the

nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16896] Another function of VGAM316 is therefore inhibition of KIAA0945 (Accession NM_014952). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0945. NECL1 (Accession NM_021189) is another VGAM316 host target gene. NECL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NECL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NECL1 BINDING SITE, designated SEQ ID:22167, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16897] Another function of VGAM316 is therefore inhibition of NECL1 (Accession NM_021189). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NECL1. P311 (Accession NM_004772) is another VGAM316 host target gene. P311 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by P311, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P311 BINDING SITE, designated SEQ ID:11162, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16898] Another function of VGAM316 is therefore inhibition of P311 (Accession NM_004772). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P311. RAB10, Member RAS Oncogene Family (RAB10, Accession XM_097979) is another VGAM316 host target gene. RAB10 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RAB10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB10 BINDING SITE, designated SEQ ID:41280, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16899] Another function of VGAM316 is therefore inhibition of RAB10, Member RAS Oncogene Family (RAB10, Accession

XM_097979). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB10. SR-BP1 (Accession NM_005866) is another VGAM316 host target gene. SR-BP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SR-BP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SR-BP1 BINDING SITE, designated SEQ ID:12486, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16900] Another function of VGAM316 is therefore inhibition of SR-BP1 (Accession NM_005866). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SR-BP1. Transducer of ERBB2, 2 (TOB2, Accession XM_170995) is another VGAM316 host target gene. TOB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of TOB2 BINDING SITE, designated SEQ ID:45759, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16901] Another function of VGAM316 is therefore inhibition of Transducer of ERBB2, 2 (TOB2, Accession XM_170995). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOB2. Zinc Finger, DHHC Domain Containing 3 (ZDHHC3, Accession NM_016598) is another VGAM316 host target gene. ZDHHC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZDHHC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZDHHC3 BINDING SITE, designated SEQ ID:18687, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16902] Another function of VGAM316 is therefore inhibition of Zinc Finger, DHHC Domain Containing 3 (ZDHHC3, Accession NM_016598). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with ZDHHC3. LOC115265 (Accession XM_055596) is another VGAM316 host target gene. LOC115265 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115265 BINDING SITE, designated SEQ ID:36308, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16903] Another function of VGAM316 is therefore inhibition of LOC115265 (Accession XM_055596). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115265. LOC145719 (Accession XM_096848) is another VGAM316 host target gene. LOC145719 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145719 BINDING SITE, designated SEQ ID:40569, to

the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16904] Another function of VGAM316 is therefore inhibition of LOC145719 (Accession XM_096848). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145719. LOC145720 (Accession XM_096846) is another VGAM316 host target gene. LOC145720 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145720, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145720 BINDING SITE, designated SEQ ID:40559, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16905] Another function of VGAM316 is therefore inhibition of LOC145720 (Accession XM_096846). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145720. LOC147671 (Accession XM_085844) is another VGAM316 host target gene. LOC147671 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC147671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147671 BINDING SITE, designated SEQ ID:38374, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16906] Another function of VGAM316 is therefore inhibition of LOC147671 (Accession XM_085844). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147671. LOC148137 (Accession NM_144692) is another VGAM316 host target gene. LOC148137 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148137, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148137 BINDING SITE, designated SEQ ID:29518, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16907] Another function of VGAM316 is therefore inhibition of LOC148137 (Accession NM_144692). Accordingly, utilities

of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148137. LOC150295 (Accession XM_097868) is another VGAM316 host target gene. LOC150295 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150295 BINDING SITE, designated SEQ ID:41179, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16908] Another function of VGAM316 is therefore inhibition of LOC150295 (Accession XM_097868). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150295. LOC197117 (Accession XM_116989) is another VGAM316 host target gene. LOC197117 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197117, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC197117 BINDING SITE, designated SEQ ID:43192, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16909] Another function of VGAM316 is therefore inhibition of LOC197117 (Accession XM_116989). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197117. LOC221755 (Accession XM_166465) is another VGAM316 host target gene. LOC221755 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221755, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221755 BINDING SITE, designated SEQ ID:44385, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16910] Another function of VGAM316 is therefore inhibition of LOC221755 (Accession XM_166465). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221755. LOC254020 (Accession XM_171198) is another VGAM316 host target gene. LOC254020 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254020, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254020 BINDING SITE, designated SEQ ID:45987, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16911] Another function of VGAM316 is therefore inhibition of LOC254020 (Accession XM_171198). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254020. LOC91250 (Accession XM_037135) is another VGAM316 host target gene. LOC91250 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91250, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91250 BINDING SITE, designated SEQ ID:32547, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16912] Another function of VGAM316 is therefore inhibition of

LOC91250 (Accession XM_037135). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91250. LOC92539 (Accession XM_045632) is another VGAM316 host target gene. LOC92539 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92539, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92539 BINDING SITE, designated SEQ ID:34494, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:3027.

[16913] Another function of VGAM316 is therefore inhibition of LOC92539 (Accession XM_045632). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92539. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 317 (VGAM317) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[16914] VGAM317 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM317 was detected is described hereinabove with reference to Figs. 1–8.

[16915] VGAM317 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 3. VGAM317 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16916] VGAM317 gene encodes a VGAM317 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM317 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM317 precursor RNA is designated SEQ ID:303, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:303 is located at position 1398 relative to the genome of Cryphonectria Hypovirus 3.

[16917] VGAM317 precursor RNA folds onto itself, forming VGAM317 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[16918] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM317 folded precursor RNA into VGAM317 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 41%) nucleotide se-
quence of VGAM317 RNA is designated SEQ ID:3028, and
is provided hereinbelow with reference to the sequence
listing part.

[16919] VGAM317 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM317 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM317 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[16920] VGAM317 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM317 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM317 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM317 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM317 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[16921] The complementary binding of VGAM317 RNA, herein designated VGAM RNA, to host target binding sites on VGAM317 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM317 host target RNA into VGAM317 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16922] It is appreciated that VGAM317 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM317 host target genes. The mRNA of each one of this plurality of VGAM317 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM317 RNA, herein designated VGAM RNA, and which when bound by VGAM317 RNA causes inhibition of translation of respective one or more VGAM317 host target proteins.

[16923] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM317 gene, herein designated VGAM GENE, on one or

more VGAM317 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16924] It is yet further appreciated that a function of VGAM317 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM317 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 3. Specific functions, and accordingly utilities, of VGAM317 correlate with, and may be deduced from, the identity of the host target genes which VGAM317 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [16925] Nucleotide sequences of the VGAM317 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM317 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM317 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM317 are further described hereinbelow with reference to Table 1.
- [16926] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM317 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM317 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [16927] As mentioned hereinabove with reference to Fig. 1, a function of VGAM317 gene, herein designated VGAM is inhibition of expression of VGAM317 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM317 correlate with, and may be deduced from, the identity of the target genes which VGAM317 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [16928] Suppressor of Cytokine Signaling 5 (SOCS5, Accession

NM_014011) is a VGAM317 host target gene. SOCS5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOCS5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOCS5 BINDING SITE, designated SEQ ID:15224, to the nucleotide sequence of VGAM317 RNA, herein designated VGAM RNA, also designated SEQ ID:3028.

[16929] A function of VGAM317 is therefore inhibition of Suppressor of Cytokine Signaling 5 (SOCS5, Accession NM_014011). Accordingly, utilities of VGAM317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOCS5. DKFZp434F1719 (Accession NM_032248) is another VGAM317 host target gene. DKFZp434F1719 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434F1719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434F1719 BINDING SITE, designated SEQ ID:25989, to the nucleotide sequence of VGAM317 RNA, herein designated VGAM

RNA, also designated SEQ ID:3028.

[16930] Another function of VGAM317 is therefore inhibition of DKFZp434F1719 (Accession NM_032248). Accordingly, utilities of VGAM317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434F1719. KIAA0841 (Accession XM_049237) is another VGAM317 host target gene. KIAA0841 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0841 BINDING SITE, designated SEQ ID:35358, to the nucleotide sequence of VGAM317 RNA, herein designated VGAM RNA, also designated SEQ ID:3028.

[16931] Another function of VGAM317 is therefore inhibition of KIAA0841 (Accession XM_049237). Accordingly, utilities of VGAM317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0841. KIAA1317 (Accession XM_098368) is another VGAM317 host target gene. KIAA1317 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1317, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1317 BINDING SITE, designated SEQ ID:41625, to the nucleotide sequence of VGAM317 RNA, herein designated VGAM RNA, also designated SEQ ID:3028.

[16932] Another function of VGAM317 is therefore inhibition of KIAA1317 (Accession XM_098368). Accordingly, utilities of VGAM317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1317. KIAA1546 (Accession XM_042301) is another VGAM317 host target gene. KIAA1546 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1546, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1546 BINDING SITE, designated SEQ ID:33713, to the nucleotide sequence of VGAM317 RNA, herein designated VGAM RNA, also designated SEQ ID:3028.

[16933] Another function of VGAM317 is therefore inhibition of KIAA1546 (Accession XM_042301). Accordingly, utilities of VGAM317 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1546. Mesoderm Development Candidate 2 (MESDC2, Accession XM_051854) is another VGAM317 host target gene. MESDC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MESDC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MESDC2 BINDING SITE, designated SEQ ID:35889, to the nucleotide sequence of VGAM317 RNA, herein designated VGAM RNA, also designated SEQ ID:3028.

[16934] Another function of VGAM317 is therefore inhibition of Mesoderm Development Candidate 2 (MESDC2, Accession XM_051854). Accordingly, utilities of VGAM317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MESDC2. LOC163479 (Accession XM_088925) is another VGAM317 host target gene. LOC163479 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163479, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC163479 BINDING SITE, designated SEQ ID:39956, to the nucleotide sequence of VGAM317 RNA, herein designated VGAM RNA, also designated SEQ ID:3028.

[16935] Another function of VGAM317 is therefore inhibition of LOC163479 (Accession XM_088925). Accordingly, utilities of VGAM317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163479. LOC51696 (Accession NM_016217) is another VGAM317 host target gene. LOC51696 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51696 BINDING SITE, designated SEQ ID:18309, to the nucleotide sequence of VGAM317 RNA, herein designated VGAM RNA, also designated SEQ ID:3028.

[16936] Another function of VGAM317 is therefore inhibition of LOC51696 (Accession NM_016217). Accordingly, utilities of VGAM317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51696. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 318 (VGAM318) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16937] VGAM318 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM318 was detected is described hereinabove with reference to Figs. 1–8.

[16938] VGAM318 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 3. VGAM318 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16939] VGAM318 gene encodes a VGAM318 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM318 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM318 precursor RNA is designated SEQ ID:304, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:304 is

located at position 739 relative to the genome of Cryphonectria Hypovirus 3.

[16940] VGAM318 precursor RNA folds onto itself, forming VGAM318 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16941] An enzyme complex designated DICER COMPLEX, `dices` the VGAM318 folded precursor RNA into VGAM318 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM318 RNA is designated SEQ ID:3029, and is provided hereinbelow with reference to the sequence listing part.

[16942] VGAM318 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM318 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM318 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[16943] VGAM318 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM318 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM318 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM318 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM318 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[16944] The complementary binding of VGAM318 RNA, herein designated VGAM RNA, to host target binding sites on VGAM318 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM318 host target RNA into VGAM318 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16945] It is appreciated that VGAM318 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM318 host target genes. The mRNA of each one of this plurality of VGAM318 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM318 RNA, herein designated VGAM RNA, and which when bound by VGAM318 RNA causes inhibition of translation of respective one or more VGAM318

host target proteins.

[16946] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM318 gene, herein designated VGAM GENE, on one or more VGAM318 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16947] It is yet further appreciated that a function of VGAM318 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM318 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 3.

Specific functions, and accordingly utilities, of VGAM318 correlate with, and may be deduced from, the identity of the host target genes which VGAM318 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16948] Nucleotide sequences of the VGAM318 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM318 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM318 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM318 are further described hereinbelow with reference to Table 1.

[16949] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM318 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM318 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16950] As mentioned hereinabove with reference to Fig. 1, a function of VGAM318 gene, herein designated VGAM is inhibition of expression of VGAM318 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM318 correlate with, and may be deduced from, the identity of the target genes which VGAM318 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16951] Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 3 (p55, gamma) (PIK3R3, Accession XM_027982) is a VGAM318 host target gene. PIK3R3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIK3R3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3R3 BINDING SITE, designated SEQ ID:30607, to the nucleotide sequence of VGAM318 RNA, herein designated VGAM RNA, also designated SEQ ID:3029.

[16952] A function of VGAM318 is therefore inhibition of Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 3 (p55, gamma) (PIK3R3, Accession XM_027982). Accordingly, utilities of VGAM318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3R3. FLJ11342 (Accession NM_018394) is another VGAM318 host target gene. FLJ11342 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ11342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11342 BINDING SITE, designated SEQ ID:20432, to the nucleotide sequence of VGAM318 RNA, herein designated VGAM RNA, also designated SEQ ID:3029.

[16953] Another function of VGAM318 is therefore inhibition of FLJ11342 (Accession NM_018394). Accordingly, utilities of VGAM318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11342. KIAA0397 (Accession XM_029438) is another VGAM318 host target gene. KIAA0397 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0397 BINDING SITE, designated SEQ ID:30893, to the nucleotide sequence of VGAM318 RNA, herein designated VGAM RNA, also designated SEQ ID:3029.

[16954] Another function of VGAM318 is therefore inhibition of KIAA0397 (Accession XM_029438). Accordingly, utilities

of VGAM318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0397. LOC149146 (Accession XM_086441) is another VGAM318 host target gene. LOC149146 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149146 BINDING SITE, designated SEQ ID:38655, to the nucleotide sequence of VGAM318 RNA, herein designated VGAM RNA, also designated SEQ ID:3029.

[16955] Another function of VGAM318 is therefore inhibition of LOC149146 (Accession XM_086441). Accordingly, utilities of VGAM318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149146. LOC164684 (Accession XM_092926) is another VGAM318 host target gene. LOC164684 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC164684, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC164684 BINDING SITE, designated SEQ ID:40158, to the nucleotide sequence of VGAM318 RNA, herein designated VGAM RNA, also designated SEQ ID:3029.

[16956] Another function of VGAM318 is therefore inhibition of LOC164684 (Accession XM_092926). Accordingly, utilities of VGAM318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164684. LOC200563 (Accession XM_117251) is another VGAM318 host target gene. LOC200563 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200563 BINDING SITE, designated SEQ ID:43320, to the nucleotide sequence of VGAM318 RNA, herein designated VGAM RNA, also designated SEQ ID:3029.

[16957] Another function of VGAM318 is therefore inhibition of LOC200563 (Accession XM_117251). Accordingly, utilities of VGAM318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200563. LOC253832 (Accession XM_170739) is another VGAM318 host target gene. LOC253832 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253832, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253832 BINDING SITE, designated SEQ ID:45498, to the nucleotide sequence of VGAM318 RNA, herein designated VGAM RNA, also designated SEQ ID:3029.

[16958] Another function of VGAM318 is therefore inhibition of LOC253832 (Accession XM_170739). Accordingly, utilities of VGAM318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253832. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 319 (VGAM319) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16959] VGAM319 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM319 was detected is described hereinabove with reference to Figs. 1-8.

[16960] VGAM319 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma Virus.

VGAM319 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16961] VGAM319 gene encodes a VGAM319 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM319 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM319 precursor RNA is designated SEQ ID:305, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:305 is located at position 46864 relative to the genome of Myxoma Virus.

[16962] VGAM319 precursor RNA folds onto itself, forming VGAM319 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[16963] An enzyme complex designated DICER COMPLEX, `dices` the VGAM319 folded precursor RNA into VGAM319 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM319 RNA is designated SEQ ID:3030, and is provided hereinbelow with reference to the sequence listing part.

[16964] VGAM319 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM319 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM319 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[16965] VGAM319 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM319 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM319 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM319 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM319 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[16966] The complementary binding of VGAM319 RNA, herein designated VGAM RNA, to host target binding sites on VGAM319 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM319 host target RNA into VGAM319 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16967] It is appreciated that VGAM319 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM319 host target genes. The mRNA of each one of this plurality of VGAM319 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM319 RNA, herein designated VGAM RNA, and which when bound by VGAM319 RNA causes inhibition of translation of respective one or more VGAM319 host target proteins.

[16968] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM319 gene, herein designated VGAM GENE, on one or more VGAM319 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16969] It is yet further appreciated that a function of VGAM319 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM319 include diagnosis, prevention and treatment of viral infection by Myxoma Virus. Specific functions, and accordingly utilities, of VGAM319 correlate with, and may be deduced from, the identity of the host target genes which VGAM319 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16970] Nucleotide sequences of the VGAM319 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM319 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM319 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM319 are further described hereinbelow with reference to Table 1.

[16971] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM319 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM319 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16972] As mentioned hereinabove with reference to Fig. 1, a function of VGAM319 gene, herein designated VGAM is inhibition of expression of VGAM319 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM319 correlate with, and may be deduced from, the identity of the target genes which VGAM319 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16973] Leptin (obesity homolog, mouse) (LEP, Accession NM_000230) is a VGAM319 host target gene. LEP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LEP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LEP BINDING SITE, designated SEQ ID:5734, to the nucleotide sequence of VGAM319 RNA, herein designated VGAM RNA, also designated SEQ ID:3030.

[16974] A function of VGAM319 is therefore inhibition of Leptin (obesity homolog, mouse) (LEP, Accession NM_000230). Accordingly, utilities of VGAM319 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEP. FLJ20051 (Accession NM_019087) is another VGAM319 host target gene. FLJ20051 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20051, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20051 BINDING SITE, designated SEQ ID:21161, to the nucleotide sequence of VGAM319 RNA, herein designated VGAM RNA, also designated SEQ ID:3030.

[16975] Another function of VGAM319 is therefore inhibition of FLJ20051 (Accession NM_019087). Accordingly, utilities of VGAM319 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20051. Integrin, Beta 5 (ITGB5, Accession XM_003029) is another

VGAM319 host target gene. ITGB5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGB5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGB5 BINDING SITE, designated SEQ ID:29922, to the nucleotide sequence of VGAM319 RNA, herein designated VGAM RNA, also designated SEQ ID:3030.

[16976] Another function of VGAM319 is therefore inhibition of Integrin, Beta 5 (ITGB5, Accession XM_003029). Accordingly, utilities of VGAM319 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGB5. KIAA1784 (Accession XM_036660) is another VGAM319 host target gene. KIAA1784 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1784, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1784 BINDING SITE, designated SEQ ID:32483, to the nucleotide sequence of VGAM319 RNA, herein designated VGAM RNA, also designated SEQ ID:3030.

[16977] Another function of VGAM319 is therefore inhibition of KIAA1784 (Accession XM_036660). Accordingly, utilities of VGAM319 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1784. MAIL (Accession NM_031419) is another VGAM319 host target gene. MAIL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAIL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAIL BINDING SITE, designated SEQ ID:25404, to the nucleotide sequence of VGAM319 RNA, herein designated VGAM RNA, also designated SEQ ID:3030.

[16978] Another function of VGAM319 is therefore inhibition of MAIL (Accession NM_031419). Accordingly, utilities of VGAM319 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAIL. SDS3 (Accession XM_045014) is another VGAM319 host target gene. SDS3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SDS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of SDS3 BINDING SITE, designated SEQ ID:34321, to the nucleotide sequence of VGAM319 RNA, herein designated VGAM RNA, also designated SEQ ID:3030.

[16979] Another function of VGAM319 is therefore inhibition of SDS3 (Accession XM_045014). Accordingly, utilities of VGAM319 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDS3. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 320 (VGAM320) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16980] VGAM320 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM320 was detected is described hereinabove with reference to Figs. 1–8.

[16981] VGAM320 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma Virus. VGAM320 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[16982] VGAM320 gene encodes a VGAM320 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM320 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM320 precursor RNA is designated SEQ ID:306, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:306 is located at position 46583 relative to the genome of Myxoma Virus.

[16983] VGAM320 precursor RNA folds onto itself, forming VGAM320 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[16984] An enzyme complex designated DICER COMPLEX, `dices` the VGAM320 folded precursor RNA into VGAM320 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM320 RNA is designated SEQ ID:3031, and is provided hereinbelow with reference to the sequence listing part.

[16985] VGAM320 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM320 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM320 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[16986] VGAM320 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM320 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM320 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM320 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM320 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[16987] The complementary binding of VGAM320 RNA, herein designated VGAM RNA, to host target binding sites on VGAM320 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM320 host target RNA into VGAM320 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[16988] It is appreciated that VGAM320 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM320 host target genes. The mRNA of each one of this plurality of VGAM320 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM320 RNA, herein designated VGAM RNA, and which when bound by VGAM320 RNA causes inhibition of translation of respective one or more VGAM320 host target proteins.

[16989] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM320 gene, herein designated VGAM GENE, on one or more VGAM320 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[16990] It is yet further appreciated that a function of VGAM320 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM320 include diagnosis, prevention and treatment of viral infection by Myxoma Virus. Specific functions, and accordingly utilities, of VGAM320 correlate with, and may be deduced from, the identity of the host target genes which VGAM320 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[16991] Nucleotide sequences of the VGAM320 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM320 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM320 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM320 are further described hereinbelow with reference to Table 1.

[16992] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM320 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM320 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[16993] As mentioned hereinabove with reference to Fig. 1, a function of VGAM320 gene, herein designated VGAM is inhibition of expression of VGAM320 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM320 correlate with, and may be deduced from, the identity of the target genes which VGAM320 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[16994] GRB2-associated Binding Protein 2 (GAB2, Accession NM_012296) is a VGAM320 host target gene. GAB2 BINDING SITE1 and GAB2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GAB2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAB2 BINDING SITE1 and GAB2 BINDING SITE2, designated SEQ ID:14646 and SEQ ID:27842 respectively, to the nucleotide sequence of

VGAM320 RNA, herein designated VGAM RNA, also designated SEQ ID:3031.

[16995] A function of VGAM320 is therefore inhibition of GRB2-associated Binding Protein 2 (GAB2, Accession NM_012296), a gene which act as adapters for transmitting various signals. Accordingly, utilities of VGAM320 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB2. The function of GAB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM53.FLJ13612 (Accession NM_025202) is another VGAM320 host target gene. FLJ13612 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13612, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13612 BINDING SITE, designated SEQ ID:24863, to the nucleotide sequence of VGAM320 RNA, herein designated VGAM RNA, also designated SEQ ID:3031.

[16996] Another function of VGAM320 is therefore inhibition of FLJ13612 (Accession NM_025202). Accordingly, utilities of

VGAM320 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13612. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 321 (VGAM321) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[16997] VGAM321 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM321 was detected is described hereinabove with reference to Figs. 1–8.

[16998] VGAM321 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma Virus.

VGAM321 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[16999] VGAM321 gene encodes a VGAM321 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM321 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM321 precursor RNA is designated SEQ

ID:307, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:307 is located at position 52219 relative to the genome of Myxoma Virus.

[17000] VGAM321 precursor RNA folds onto itself, forming VGAM321 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17001] An enzyme complex designated DICER COMPLEX, `dices` the VGAM321 folded precursor RNA into VGAM321 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM321 RNA is designated SEQ ID:3032, and is provided hereinbelow with reference to the sequence

listing part.

[17002] VGAM321 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM321 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM321 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17003] VGAM321 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM321 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM321 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM321 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM321 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17004] The complementary binding of VGAM321 RNA, herein designated VGAM RNA, to host target binding sites on VGAM321 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM321 host target RNA into VGAM321 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17005] It is appreciated that VGAM321 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM321 host target genes. The mRNA of each one of this plurality of VGAM321 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM321 RNA, herein designated VGAM

RNA, and which when bound by VGAM321 RNA causes inhibition of translation of respective one or more VGAM321 host target proteins.

[17006] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM321 gene, herein designated VGAM GENE, on one or more VGAM321 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17007] It is yet further appreciated that a function of VGAM321 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM321 include diagnosis, prevention and treatment of viral infection by Myxoma Virus. Specific functions, and accordingly utilities, of VGAM321 correlate with, and may be deduced from, the identity of the host target genes which VGAM321 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [17008] Nucleotide sequences of the VGAM321 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM321 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM321 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM321 are further described hereinbelow with reference to Table 1.
- [17009] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM321 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM321 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [17010] As mentioned hereinabove with reference to Fig. 1, a function of VGAM321 gene, herein designated VGAM is

inhibition of expression of VGAM321 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM321 correlate with, and may be deduced from, the identity of the target genes which VGAM321 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17011] Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is a VGAM321 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:44328, to the nucleotide sequence of VGAM321 RNA, herein designated VGAM RNA, also designated SEQ ID:3032.

[17012] A function of VGAM321 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Estrogen-related Receptor Beta Like 1 (ESRRBL1, Accession NM_018010) is another VGAM321 host target gene. ESRRBL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ESRRBL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESRRBL1 BINDING SITE, designated SEQ ID:19742, to the nucleotide sequence of VGAM321 RNA, herein designated VGAM RNA, also designated SEQ ID:3032.

[17013] Another function of VGAM321 is therefore inhibition of Estrogen-related Receptor Beta Like 1 (ESRRBL1, Accession NM_018010). Accordingly, utilities of VGAM321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESRRBL1. Baculoviral IAP Repeat-containing 2 (BIRC2, Accession XM_040717) is another VGAM321 host target gene. BIRC2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BIRC2, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIRC2 BINDING SITE, designated SEQ ID:33371, to the nucleotide sequence of VGAM321 RNA, herein designated VGAM RNA, also designated SEQ ID:3032.

[17014] Another function of VGAM321 is therefore inhibition of Baculoviral IAP Repeat-containing 2 (BIRC2, Accession XM_040717). Accordingly, utilities of VGAM321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC2. Chromobox Homolog 3 (HP1 gamma homolog, Drosophila) (CBX3, Accession NM_007276) is another VGAM321 host target gene. CBX3 BINDING SITE1 and CBX3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CBX3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBX3 BINDING SITE1 and CBX3 BINDING SITE2, designated SEQ ID:14140 and SEQ ID:18660 respectively, to the nucleotide sequence of VGAM321 RNA, herein designated VGAM RNA, also designated SEQ ID:3032.

[17015] Another function of VGAM321 is therefore inhibition of Chromobox Homolog 3 (HP1 gamma homolog, Drosophila) (CBX3, Accession NM_007276). Accordingly, utilities of VGAM321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBX3. KIAA1715 (Accession XM_042834) is another VGAM321 host target gene. KIAA1715 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1715 BINDING SITE, designated SEQ ID:33789, to the nucleotide sequence of VGAM321 RNA, herein designated VGAM RNA, also designated SEQ ID:3032.

[17016] Another function of VGAM321 is therefore inhibition of KIAA1715 (Accession XM_042834). Accordingly, utilities of VGAM321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1715. MFN1 (Accession NM_017927) is another VGAM321 host target gene. MFN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MFN1, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MFN1 BINDING SITE, designated SEQ ID:19602, to the nucleotide sequence of VGAM321 RNA, herein designated VGAM RNA, also designated SEQ ID:3032.

[17017] Another function of VGAM321 is therefore inhibition of MFN1 (Accession NM_017927). Accordingly, utilities of VGAM321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MFN1. Rab11-FIP2 (Accession NM_014904) is another VGAM321 host target gene. Rab11-FIP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Rab11-FIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rab11-FIP2 BINDING SITE, designated SEQ ID:17095, to the nucleotide sequence of VGAM321 RNA, herein designated VGAM RNA, also designated SEQ ID:3032.

[17018] Another function of VGAM321 is therefore inhibition of Rab11-FIP2 (Accession NM_014904). Accordingly, utilities of VGAM321 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with Rab11-FIP2. SNRK (Accession NM_017719) is another VGAM321 host target gene. SNRK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNRK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNRK BINDING SITE, designated SEQ ID:19310, to the nucleotide sequence of VGAM321 RNA, herein designated VGAM RNA, also designated SEQ ID:3032.

[17019] Another function of VGAM321 is therefore inhibition of SNRK (Accession NM_017719). Accordingly, utilities of VGAM321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNRK. LOC155434 (Accession XM_098723) is another VGAM321 host target gene. LOC155434 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155434, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155434 BINDING SITE, designated SEQ ID:41770, to the nucleotide se-

quence of VGAM321 RNA, herein designated VGAM RNA, also designated SEQ ID:3032.

[17020] Another function of VGAM321 is therefore inhibition of LOC155434 (Accession XM_098723). Accordingly, utilities of VGAM321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155434. LOC158563 (Accession XM_088606) is another VGAM321 host target gene. LOC158563 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158563 BINDING SITE, designated SEQ ID:39867, to the nucleotide sequence of VGAM321 RNA, herein designated VGAM RNA, also designated SEQ ID:3032.

[17021] Another function of VGAM321 is therefore inhibition of LOC158563 (Accession XM_088606). Accordingly, utilities of VGAM321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158563. LOC257358 (Accession XM_173138) is another VGAM321 host target gene. LOC257358 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC257358, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257358 BINDING SITE, designated SEQ ID:46387, to the nucleotide sequence of VGAM321 RNA, herein designated VGAM RNA, also designated SEQ ID:3032.

[17022] Another function of VGAM321 is therefore inhibition of LOC257358 (Accession XM_173138). Accordingly, utilities of VGAM321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257358. LOC91660 (Accession XM_039902) is another VGAM321 host target gene. LOC91660 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91660, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91660 BINDING SITE, designated SEQ ID:33206, to the nucleotide sequence of VGAM321 RNA, herein designated VGAM RNA, also designated SEQ ID:3032.

[17023] Another function of VGAM321 is therefore inhibition of LOC91660 (Accession XM_039902). Accordingly, utilities

of VGAM321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91660. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 322 (VGAM322) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17024] VGAM322 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM322 was detected is described hereinabove with reference to Figs. 1–8.

[17025] VGAM322 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma Virus. VGAM322 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17026] VGAM322 gene encodes a VGAM322 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM322 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM322 precursor RNA is designated SEQ ID:308, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:308 is located at position 88846 relative to the genome of Myxoma Virus.

[17027] VGAM322 precursor RNA folds onto itself, forming VGAM322 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17028] An enzyme complex designated DICER COMPLEX, `dices` the VGAM322 folded precursor RNA into VGAM322 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM322 RNA is designated SEQ ID:3033, and

is provided hereinbelow with reference to the sequence listing part.

[17029] VGAM322 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM322 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM322 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17030] VGAM322 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM322 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM322 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM322 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM322 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17031] The complementary binding of VGAM322 RNA, herein designated VGAM RNA, to host target binding sites on VGAM322 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM322 host target RNA into VGAM322 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17032] It is appreciated that VGAM322 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM322 host target genes. The mRNA of each one of this plurality of VGAM322 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM322 RNA, herein designated VGAM RNA, and which when bound by VGAM322 RNA causes inhibition of translation of respective one or more VGAM322 host target proteins.

[17033] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM322 gene, herein designated VGAM GENE, on one or more VGAM322 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17034] It is yet further appreciated that a function of VGAM322 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM322 include diagnosis, prevention and treatment of viral infection by Myxoma Virus. Specific functions, and accordingly utilities, of VGAM322 correlate with, and may be deduced from, the identity of the host target genes which VGAM322 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17035] Nucleotide sequences of the VGAM322 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM322 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM322 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM322 are further described hereinbelow with reference to Table 1.

[17036] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM322 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM322 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17037] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM322 gene, herein designated VGAM is inhibition of expression of VGAM322 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM322 correlate with, and may be deduced from, the identity of the target genes which VGAM322 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17038] LY95 (Accession NM_004828) is a VGAM322 host target gene. LY95 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LY95, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LY95 BINDING SITE, designated SEQ ID:11241, to the nucleotide sequence of VGAM322 RNA, herein designated VGAM RNA, also designated SEQ ID:3033.

[17039] A function of VGAM322 is therefore inhibition of LY95 (Accession NM_004828). Accordingly, utilities of VGAM322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LY95. Reelin (RELN, Accession XM_168628) is another VGAM322 host target gene. RELN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by RELN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RELN BINDING SITE, designated SEQ ID:45283, to the nucleotide sequence of VGAM322 RNA, herein designated VGAM RNA, also designated SEQ ID:3033.

[17040] Another function of VGAM322 is therefore inhibition of Reelin (RELN, Accession XM_168628), a gene which regulates microtubule function in neurons and neuronal migration. Accordingly, utilities of VGAM322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RELN. The function of RELN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM35. LHX6 (Accession NM_014368) is another VGAM322 host target gene. LHX6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LHX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LHX6 BINDING SITE, designated SEQ ID:15699,

to the nucleotide sequence of VGAM322 RNA, herein designated VGAM RNA, also designated SEQ ID:3033.

[17041] Another function of VGAM322 is therefore inhibition of LHX6 (Accession NM_014368). Accordingly, utilities of VGAM322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHX6. RAB40A, Member RAS Oncogene Family (RAB40A, Accession XM_088733) is another VGAM322 host target gene. RAB40A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RAB40A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB40A BINDING SITE, designated SEQ ID:39925, to the nucleotide sequence of VGAM322 RNA, herein designated VGAM RNA, also designated SEQ ID:3033.

[17042] Another function of VGAM322 is therefore inhibition of RAB40A, Member RAS Oncogene Family (RAB40A, Accession XM_088733). Accordingly, utilities of VGAM322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB40A. LOC116113 (Accession XM_166413) is another VGAM322 host target

gene. LOC116113 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116113 BINDING SITE, designated SEQ ID:44288, to the nucleotide sequence of VGAM322 RNA, herein designated VGAM RNA, also designated SEQ ID:3033.

[17043] Another function of VGAM322 is therefore inhibition of LOC116113 (Accession XM_166413). Accordingly, utilities of VGAM322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116113. LOC200107 (Accession XM_114121) is another VGAM322 host target gene. LOC200107 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200107, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200107 BINDING SITE, designated SEQ ID:42708, to the nucleotide sequence of VGAM322 RNA, herein designated VGAM RNA, also designated SEQ ID:3033.

[17044] Another function of VGAM322 is therefore inhibition of LOC200107 (Accession XM_114121). Accordingly, utilities of VGAM322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200107. LOC206426 (Accession XM_116505) is another VGAM322 host target gene. LOC206426 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC206426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC206426 BINDING SITE, designated SEQ ID:43114, to the nucleotide sequence of VGAM322 RNA, herein designated VGAM RNA, also designated SEQ ID:3033.

[17045] Another function of VGAM322 is therefore inhibition of LOC206426 (Accession XM_116505). Accordingly, utilities of VGAM322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC206426. LOC257017 (Accession XM_173227) is another VGAM322 host target gene. LOC257017 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257017, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257017 BINDING SITE, designated SEQ ID:46497, to the nucleotide sequence of VGAM322 RNA, herein designated VGAM RNA, also designated SEQ ID:3033.

[17046] Another function of VGAM322 is therefore inhibition of LOC257017 (Accession XM_173227). Accordingly, utilities of VGAM322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257017. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 323 (VGAM323) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17047] VGAM323 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM323 was detected is described hereinabove with reference to Figs. 1–8.

[17048] VGAM323 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma Virus. VGAM323 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[17049] VGAM323 gene encodes a VGAM323 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM323 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM323 precursor RNA is designated SEQ ID:309, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:309 is located at position 145414 relative to the genome of Myxoma Virus.

[17050] VGAM323 precursor RNA folds onto itself, forming VGAM323 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17051] An enzyme complex designated DICER COMPLEX, `dices` the VGAM323 folded precursor RNA into VGAM323 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM323 RNA is designated SEQ ID:3034, and is provided hereinbelow with reference to the sequence listing part.

[17052] VGAM323 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM323 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM323 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17053] VGAM323 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM323 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM323 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM323 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM323 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17054] The complementary binding of VGAM323 RNA, herein designated VGAM RNA, to host target binding sites on VGAM323 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM323 host target RNA into VGAM323 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[17055] It is appreciated that VGAM323 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM323 host target genes. The mRNA of each one of this plurality of VGAM323 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM323 RNA, herein designated VGAM RNA, and which when bound by VGAM323 RNA causes inhibition of translation of respective one or more VGAM323 host target proteins.

[17056] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM323 gene, herein designated VGAM GENE, on one or more VGAM323 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17057] It is yet further appreciated that a function of VGAM323 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM323 include diagnosis, prevention and treatment of viral infection by Myxoma Virus. Specific functions, and accordingly utilities, of VGAM323 correlate with, and may be deduced from, the identity of the host target genes which VGAM323 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17058] Nucleotide sequences of the VGAM323 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM323 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM323 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM323 are further described hereinbelow with reference to Table 1.

[17059] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM323 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM323 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17060] As mentioned hereinabove with reference to Fig. 1, a function of VGAM323 gene, herein designated VGAM is inhibition of expression of VGAM323 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM323 correlate with, and may be deduced from, the identity of the target genes which VGAM323 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17061] Adenosine Deaminase, RNA-specific (ADAR, Accession NM_001111) is a VGAM323 host target gene. ADAR BINDING SITE1 through ADAR BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADAR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAR BINDING SITE1 through ADAR BINDING SITE3, designated SEQ ID:6776, SEQ ID:17962

and SEQ ID:17969 respectively, to the nucleotide sequence of VGAM323 RNA, herein designated VGAM RNA, also designated SEQ ID:3034.

[17062] A function of VGAM323 is therefore inhibition of Adenosine Deaminase, RNA-specific (ADAR, Accession NM_001111), a gene which converts adenosine to inosine in double-stranded RNA. Accordingly, utilities of VGAM323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAR. The function of ADAR has been established by previous studies. Double-stranded RNA-specific adenosine deaminase (DSRAD) was identified as a developmentally regulated dsRNA unwinding activity in early antisense experiments with *Xenopus* oocytes (Bass and Weintraub, 1988). The enzyme converts adenosine to inosine in dsRNA, which destabilizes the dsRNA helix. The RNA modifying activity of DSRAD is important for various functions. Among these are site-specific RNA editing of transcripts of the glutamate receptors (see OMIM Ref. No. 138248), which are channels for the neurotransmitter L-glutamate in the brain. DSRAD also functions to modify viral RNA genomes and may be responsible for hypermutation of certain negative-stranded viruses, such as measles, which

may result in lethal measles inclusion body encephalitis (Weier et al., 1995). By fluorescence in situ hybridization, Weier et al. (1995) mapped the DSRAD gene to 1q21.1–q21.2, centromeric to the marker D1S1705. Wang et al. (1995) mapped the DRADA gene to 1q21 by fluorescence in situ hybridization. By FISH, Weier et al. (2000) mapped the mouse homolog (Adar) to chromosome 3F2. Animal model experiments lend further support to the function of ADAR. Wang et al. (2000) knocked out the Adar1 gene in mice by targeted disruption and found that heterozygosity for the Adar1 knockout causes embryonic lethality.

[17063] It is appreciated that the abovementioned animal model for ADAR is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[17064] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17065] Weier, H.–U. G.; George, C. X.; Greulich, K. M.; Samuel, C. E. : The interferon–inducible, double–stranded RNA–specific adenosine deaminase gene (DSRAD) maps to human chromosome 1q21.1–21.2. Genomics 30: 372–375,

1995. ; and

[17066] Wang, Q.; Khillan, J.; Gadue, P.; Nishikura, K. : Requirement of the RNA editing deaminase ADAR1 gene for embryonic erythropoiesis. Science 290: 1765–1768, 2000.

[17067] Further studies establishing the function and utilities of ADAR are found in John Hopkins OMIM database record ID 601059, and in cited publications numbered 7151–7158 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nitric Oxide Synthase 1 (neuronal) (NOS1, Accession NM_000620) is another VGAM323 host target gene. NOS1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NOS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NOS1 BINDING SITE, designated SEQ ID:6229, to the nucleotide sequence of VGAM323 RNA, herein designated VGAM RNA, also designated SEQ ID:3034.

[17068] Another function of VGAM323 is therefore inhibition of Nitric Oxide Synthase 1 (neuronal) (NOS1, Accession NM_000620), a gene which produces nitric oxide (no) which is a messenger molecule with diverse functions

throughout the body. Accordingly, utilities of VGAM323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOS1. The function of NOS1 has been established by previous studies. Bredt et al. (1991) cloned a cDNA for the neuronal form of nitric oxide (NO) synthase and studied its expression. The only mammalian protein with close sequence similarity was cytochrome P450 reductase. Magee et al. (1996) used PCR to clone a novel form of neuronal NOS from rat penile RNA. This NOS cDNA was termed PnNOS for 'penile neuronal NOS.' Sequencing revealed that the PnNOS cDNA was identical to rat cerebellar neuronal NOS1 except for a 102-bp insertion in PnNOS, indicating that PnNOS is a novel isoform. PCR of a human penile cDNA library confirmed that this insert is present in human DNA at the same location. Repetition of RT-PCR showed PnNOS to be the only form of NOS1 expressed in rat penis, urethra, prostate, and skeletal muscle. The PnNOS form was also present in rat cerebellum, liver, and pelvic plexus, although less abundantly than the shorter isoform. The authors postulated that PnNOS may be responsible for the synthesis of nitric oxide during penile erection and may be involved in control of the tone of the urethra, prostate,

and bladder. Animal model experiments lend further support to the function of NOS1. Mice with targeted disruption of neuronal NO synthase display grossly normal appearance, locomotor activity, breeding, long-term potentiation, and long-term depression. NOS1-deficient mice are resistant to neural stroke damage following middle cerebral artery ligation. Nelson et al. (1995) reported a large increase in aggressive behavior and excessive, inappropriate sexual behavior in NOS1 'knockout' mice. Initial observations indicated that male NOS1-deficient mice engaged in chronic aggressive behavior, not apparent among NOS1-deficient female mice or wildtype male or female mice housed together. Relevance of the observations to human behavior was suggested.

[17069] It is appreciated that the abovementioned animal model for NOS1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[17070] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17071] Magee, T.; Fuentes, A. M.; Garban, H.; Rajavashisth, T.; Marquez, D.; Rodriguez, J. A.; Rajfer, J.; Gonzalez-Ca-

david, N. F. : Cloning of a novel neuronal nitric oxide synthase expressed in penis and lower urinary tract. Biochem. Biophys. Res. Commun. 226: 145–151, 1996. ; and

[17072] Nelson, R. J.; Demas, G. E.; Huang, P. L.; Fishman, M. C.; Dawson, V. L.; Dawson, T. M.; Snyder, S. H. : Behavioural abnormalities in male mice lacking neuronal nitric oxide synthase. N.

[17073] Further studies establishing the function and utilities of NOS1 are found in John Hopkins OMIM database record ID 163731, and in cited publications numbered 11031–1864, 1854, 1865, 327 and 2729–2731 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Phosphatase 3 (formerly 2B), Regulatory Subunit B, 19kDa, Alpha Isoform (calcineurin B, type I) (PPP3R1, Accession XM_084103) is another VGAM323 host target gene. PPP3R1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP3R1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP3R1 BINDING SITE, designated SEQ ID:37531, to the nucleotide sequence of VGAM323 RNA, herein designated VGAM RNA,

also designated SEQ ID:3034.

[17074] Another function of VGAM323 is therefore inhibition of Protein Phosphatase 3 (formerly 2B), Regulatory Subunit B, 19kDa, Alpha Isoform (calcineurin B, type I) (PPP3R1, Accession XM_084103), a gene which is a regulatory subunit of calcineurin, a calcium-dependent, calmodulin stimulated protein phosphatase 3. Accordingly, utilities of VGAM323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP3R1. The function of PPP3R1 has been established by previous studies. Calcineurin, a calmodulin-regulated protein phosphatase, is found in the cells of all eukaryotes ranging from yeast to mammals. Wang et al. (1996) described this heterodimeric protein as having a 19-kD $\text{Ca}(2+)$ -binding regulatory subunit, calcineurin B, and a 58- to 59-kD catalytic subunit, calcineurin A. One gene encodes calcineurin B in all tissues except testis, and it is highly conserved at the level of both protein and DNA sequences in eukaryotes. In contrast, there are 2 major isoforms, alpha (OMIM Ref. No. 114105) and beta (OMIM Ref. No. 114106), of calcineurin A encoded by separate genes located on different human chromosomes. A third isoform, A-gamma (OMIM Ref. No. 114107), is unique to

testis. Additional diversity of calcineurin A is created by alternative splicing of mRNAs. Calcineurin is especially abundant in brain where it constitutes 1% of total protein. Animal model experiments lend further support to the function of PPP3R1. Using conditional gene-targeting techniques, Zeng et al. (2001) created mice in which Cnb1 activity was disrupted specifically in the adult forebrain. At hippocampal Schaffer collateral-CA1 synapses, long-term depression (LTD) was significantly diminished, and there was a significant shift in the LTD/long-term potentiation (LTP) modification threshold in mutant mice. Although performance was normal in hippocampus-dependent reference memory tasks, including contextual fear conditioning and the Morris water maze, the mutant mice were impaired in hippocampus-dependent working and episodic-like memory tasks, including the delayed matching-to-place task and the radial maze task. These results defined a critical role for calcineurin in bidirectional synaptic plasticity and suggested a novel mechanistic distinction between working/episodic-like memory and reference memory.

[17075] It is appreciated that the abovementioned animal model for PPP3R1 is acknowledged by those skilled in the art as

a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[17076] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17077] Zeng, H.; Chattarji, S.; Barbarosie, M.; Rondi-Reig, L.; Philpot, B. D.; Miyakawa, T.; Bear, M. F.; Tonegawa, S. : Forebrain-specific calcineurin knockout selectively impairs bidirectional synaptic plasticity and working/episodic-like memory. Cell 107: 617–629, 2001. ; and

[17078] Wang, M. G.; Yi, H.; Guerini, D.; Klee, C. B.; McBride, O. W. : Calcineurin A alpha (PPP3CA), calcineurin A beta (PPP3CB) and calcineurin B (PPP3R1) are located on human chromosomes 4.

[17079] Further studies establishing the function and utilities of PPP3R1 are found in John Hopkins OMIM database record ID 601302, and in sited publications numbered 6507–6509 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Splicing Factor, Arginine/serine-rich 1 (splicing factor 2, alternate splicing factor) (SFRS1, Accession NM_006924) is another VGAM323 host target gene. SFRS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by SFRS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS1 BINDING SITE, designated SEQ ID:13800, to the nucleotide sequence of VGAM323 RNA, herein designated VGAM RNA, also designated SEQ ID:3034.

[17080] Another function of VGAM323 is therefore inhibition of Splicing Factor, Arginine/serine-rich 1 (splicing factor 2, alternate splicing factor) (SFRS1, Accession NM_006924), a gene which plays an essential role in pre-mRNA splicing. Accordingly, utilities of VGAM323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS1. The function of SFRS1 has been established by previous studies. Alternative mRNA splicing plays an important role in development and differentiation; many transcripts are spliced differently in distinct cell types and tissues. Bermingham et al. (1995) stated that while examples of alternatively spliced transcripts are found, relatively little is known about the mechanisms involved in regulating the use of alternative splice sites. Both constitutive and alternative splicing occurs on spliceosomes, which are complex particles composed of

small nuclear ribonucleoproteins (OMIM Ref. No. snRNPs) and non-snRNP proteins. The SR family of non-snRNP splicing factors is characterized by the presence of an RNA recognition motif and a serine- and arginine-rich (SR) domain. SR proteins are required at early stages of spliceosome assembly, have distinct but overlapping specificities for different pre-mRNAs, and can alter splice site choice. These observations suggested SR proteins may be involved in the regulation of alternative splicing in vivo. Two of the SR proteins have been extensively characterized: ASF/SF2 (for 'alternative splicing factor/splicing factor-2') and SC35 (for 'splicing component, 35-kD'). The genes encoding these 2 factors are designated SFRS1 and SFRS2 (OMIM Ref. No. 600813), respectively. Krainer et al. (1991) had previously isolated a human cDNA for the pre-mRNA splicing factor referred to as SF2p33, which was later designated SFRS1. Other SR proteins include SFRS4 (OMIM Ref. No. 601940), SFRS5 (OMIM Ref. No. 600914), SFRS6 (OMIM Ref. No. 601944), and SFRS8 (OMIM Ref. No. 601945). Pollard et al. (2000) sought to determine if the nuclear concentrations of the trans-acting splicing regulators SF2/ASF and HNRNPA1 (OMIM Ref. No. 164017) and its splice variant, HNRNPA1B, are fundamental in regulat-

ing the expression of specific protein isoforms derived from alternative splicing of single pre-mRNA transcripts. SF2/ASF and HNRNPA1/A1B expression was determined in paired upper (OMIM Ref. No. corpus) and lower segment myometrial samples taken from individual women at term or during spontaneous labor and compared with nonpregnant control samples using specific monoclonal antibodies. SF2/ASF levels were substantially increased in the lower uterine region, and this was associated with a parallel decrease in levels of HNRNPA1/A1B during gestation. Conversely, the opposite pattern was observed within the upper uterine region during pregnancy, where HNRNPA1/A1B was significantly upregulated and SF2/ASF levels were much lower than those found in the lower uterine segment. The authors concluded that differential expression of HNRNPA1/A1B and SF2/ASF in the upper and lower uterine segments may have a primary role in defining the formation of specific myometrial protein species associated with the known contractile and relaxatory properties of these regions before and during parturition.

[17081] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [17082] Bermingham, J. R., Jr.; Arden, K. C.; Naumova, A. K.; Sapienza, C.; Viars, C. S.; Fu, X.-D.; Khotz, J.; Manley, J. L.; Rosenfeld, M. G. : Chromosomal localization of mouse and human genes encoding the splicing factors ASF/SF2 (SFRS1) and SC-35 (SFRS2). *Genomics* 29: 70-79, 1995. ; and

- [17084] Further studies establishing the function and utilities of SFRS1 are found in John Hopkins OMIM database record ID 600812, and in cited publications numbered 7138, 172 and 7139 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. A Kinase (PRKA) Anchor Protein 6 (AKAP6, Accession NM_004274) is another VGAM323 host target gene. AKAP6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

AKAP6 BINDING SITE, designated SEQ ID:10491, to the nucleotide sequence of VGAM323 RNA, herein designated VGAM RNA, also designated SEQ ID:3034.

[17085] Another function of VGAM323 is therefore inhibition of A Kinase (PRKA) Anchor Protein 6 (AKAP6, Accession NM_004274). Accordingly, utilities of VGAM323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP6. KIAA1843 (Accession XM_030838) is another VGAM323 host target gene. KIAA1843 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1843, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1843 BINDING SITE, designated SEQ ID:31163, to the nucleotide sequence of VGAM323 RNA, herein designated VGAM RNA, also designated SEQ ID:3034.

[17086] Another function of VGAM323 is therefore inhibition of KIAA1843 (Accession XM_030838). Accordingly, utilities of VGAM323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1843. P37NB (Accession NM_005824) is another

VGAM323 host target gene. P37NB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by P37NB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P37NB BINDING SITE, designated SEQ ID:12437, to the nucleotide sequence of VGAM323 RNA, herein designated VGAM RNA, also designated SEQ ID:3034.

[17087] Another function of VGAM323 is therefore inhibition of P37NB (Accession NM_005824). Accordingly, utilities of VGAM323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P37NB. Solute Carrier Family 37 (glycerol-3-phosphate transporter), Member 1 (SLC37A1, Accession NM_018964) is another VGAM323 host target gene. SLC37A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC37A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC37A1 BINDING SITE, designated SEQ ID:21036, to the nucleotide sequence of VGAM323 RNA, herein designated

VGAM RNA, also designated SEQ ID:3034.

[17088] Another function of VGAM323 is therefore inhibition of Solute Carrier Family 37 (glycerol-3-phosphate transporter), Member 1 (SLC37A1, Accession NM_018964). Accordingly, utilities of VGAM323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC37A1. LOC256502 (Accession XM_170546) is another VGAM323 host target gene. LOC256502 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256502, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256502 BINDING SITE, designated SEQ ID:45366, to the nucleotide sequence of VGAM323 RNA, herein designated VGAM RNA, also designated SEQ ID:3034.

[17089] Another function of VGAM323 is therefore inhibition of LOC256502 (Accession XM_170546). Accordingly, utilities of VGAM323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256502. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 324 (VGAM324) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17090] VGAM324 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM324 was detected is described hereinabove with reference to Figs. 1–8.

[17091] VGAM324 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit Fibroma Virus. VGAM324 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17092] VGAM324 gene encodes a VGAM324 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM324 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM324 precursor RNA is designated SEQ ID:310, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:310 is located at position 65828 relative to the genome of Rabbit

Fibroma Virus.

[17093] VGAM324 precursor RNA folds onto itself, forming VGAM324 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17094] An enzyme complex designated DICER COMPLEX, `dices` the VGAM324 folded precursor RNA into VGAM324 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM324 RNA is designated SEQ ID:3035, and is provided hereinbelow with reference to the sequence listing part.

[17095] VGAM324 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM324 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM324 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17096] VGAM324 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM324 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM324 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM324 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM324 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17097] The complementary binding of VGAM324 RNA, herein designated VGAM RNA, to host target binding sites on VGAM324 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM324 host target RNA into VGAM324 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17098] It is appreciated that VGAM324 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM324 host target genes. The mRNA of each one of this plurality of VGAM324 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM324 RNA, herein designated VGAM RNA, and which when bound by VGAM324 RNA causes inhibition of translation of respective one or more VGAM324 host target proteins.

[17099] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM324 gene, herein designated VGAM GENE, on one or more VGAM324 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17100] It is yet further appreciated that a function of VGAM324 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM324 include diagnosis, prevention and treatment of viral infection by Rabbit Fibroma Virus. Specific functions, and accordingly utilities, of VGAM324 cor-

relate with, and may be deduced from, the identity of the host target genes which VGAM324 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17101] Nucleotide sequences of the VGAM324 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM324 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM324 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM324 are further described hereinbelow with reference to Table 1.

[17102] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM324 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM324 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17103] As mentioned hereinabove with reference to Fig. 1, a function of VGAM324 gene, herein designated VGAM is inhibition of expression of VGAM324 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM324 correlate with, and may be deduced

from, the identity of the target genes which VGAM324 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17104] Collagen, Type IV, Alpha 3 (Goodpasture antigen) (COL4A3, Accession NM_000091) is a VGAM324 host target gene. COL4A3 BINDING SITE1 through COL4A3 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL4A3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL4A3 BINDING SITE1 through COL4A3 BINDING SITE3, designated SEQ ID:5545, SEQ ID:25352 and SEQ ID:25358 respectively, to the nucleotide sequence of VGAM324 RNA, herein designated VGAM RNA, also designated SEQ ID:3035.

[17105] A function of VGAM324 is therefore inhibition of Collagen, Type IV, Alpha 3 (Goodpasture antigen) (COL4A3, Accession NM_000091). Accordingly, utilities of VGAM324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A3. Period Homolog 3 (Drosophila) (PER3, Accession NM_016831) is another VGAM324 host target gene. PER3 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PER3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PER3 BINDING SITE, designated SEQ ID:18820, to the nucleotide sequence of VGAM324 RNA, herein designated VGAM RNA, also designated SEQ ID:3035.

[17106] Another function of VGAM324 is therefore inhibition of Period Homolog 3 (Drosophila) (PER3, Accession NM_016831). Accordingly, utilities of VGAM324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PER3. Yes-associated Protein 1, 65kDa (YAP1, Accession NM_006106) is another VGAM324 host target gene. YAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by YAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YAP1 BINDING SITE, designated SEQ ID:12752, to the nucleotide sequence of VGAM324 RNA, herein designated VGAM RNA, also designated SEQ ID:3035.

[17107] Another function of VGAM324 is therefore inhibition of Yes-associated Protein 1, 65kDa (YAP1, Accession NM_006106). Accordingly, utilities of VGAM324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YAP1. LOC201627 (Accession XM_114353) is another VGAM324 host target gene. LOC201627 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201627 BINDING SITE, designated SEQ ID:42894, to the nucleotide sequence of VGAM324 RNA, herein designated VGAM RNA, also designated SEQ ID:3035.

[17108] Another function of VGAM324 is therefore inhibition of LOC201627 (Accession XM_114353). Accordingly, utilities of VGAM324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201627. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 325 (VGAM325) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17109] VGAM325 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM325 was detected is described hereinabove with reference to Figs. 1–8.

[17110] VGAM325 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit Fibroma Virus. VGAM325 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17111] VGAM325 gene encodes a VGAM325 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM325 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM325 precursor RNA is designated SEQ ID:311, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:311 is located at position 66316 relative to the genome of Rabbit Fibroma Virus.

[17112] VGAM325 precursor RNA folds onto itself, forming

VGAM325 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17113] An enzyme complex designated DICER COMPLEX, `dices` the VGAM325 folded precursor RNA into VGAM325 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM325 RNA is designated SEQ ID:3036, and is provided hereinbelow with reference to the sequence listing part.

[17114] VGAM325 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM325 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM325 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17115] VGAM325 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM325 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM325 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM325 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM325 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17116] The complementary binding of VGAM325 RNA, herein designated VGAM RNA, to host target binding sites on VGAM325 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM325 host target RNA into VGAM325 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17117] It is appreciated that VGAM325 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM325 host target genes. The mRNA of each one of this plurality of VGAM325 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM325 RNA, herein designated VGAM RNA, and which when bound by VGAM325 RNA causes inhibition of translation of respective one or more VGAM325 host target proteins.

[17118] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM325 gene, herein designated VGAM GENE, on one or more VGAM325 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17119] It is yet further appreciated that a function of VGAM325 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM325 include diagnosis, prevention and treatment of viral infection by Rabbit Fibroma Virus. Specific functions, and accordingly utilities, of VGAM325 correlate with, and may be deduced from, the identity of the host target genes which VGAM325 binds and inhibits, and

the function of these host target genes, as elaborated hereinbelow.

[17120] Nucleotide sequences of the VGAM325 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM325 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM325 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM325 are further described hereinbelow with reference to Table 1.

[17121] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM325 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM325 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17122] As mentioned hereinabove with reference to Fig. 1, a function of VGAM325 gene, herein designated VGAM is inhibition of expression of VGAM325 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM325 correlate with, and may be deduced from, the identity of the target genes which VGAM325 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[17123] ABLIM (Accession NM_002313) is a VGAM325 host target gene. ABLIM BINDING SITE1 and ABLIM BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABLIM, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABLIM BINDING SITE1 and ABLIM BINDING SITE2, designated SEQ ID:8122 and SEQ ID:13555 respectively, to the nucleotide sequence of VGAM325 RNA, herein designated VGAM RNA, also designated SEQ ID:3036.

[17124] A function of VGAM325 is therefore inhibition of ABLIM (Accession NM_002313). Accordingly, utilities of VGAM325 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABLIM. MGC13007 (Accession NM_032320) is another VGAM325 host target gene. MGC13007 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC13007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13007 BINDING

SITE, designated SEQ ID:26123, to the nucleotide sequence of VGAM325 RNA, herein designated VGAM RNA, also designated SEQ ID:3036.

[17125] Another function of VGAM325 is therefore inhibition of MGC13007 (Accession NM_032320). Accordingly, utilities of VGAM325 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13007. Ubiquitin Specific Protease 20 (USP20, Accession NM_006676) is another VGAM325 host target gene. USP20 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by USP20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP20 BINDING SITE, designated SEQ ID:13504, to the nucleotide sequence of VGAM325 RNA, herein designated VGAM RNA, also designated SEQ ID:3036.

[17126] Another function of VGAM325 is therefore inhibition of Ubiquitin Specific Protease 20 (USP20, Accession NM_006676). Accordingly, utilities of VGAM325 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP20. LOC144811

(Accession XM_096681) is another VGAM325 host target gene. LOC144811 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144811, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144811 BINDING SITE, designated SEQ ID:40455, to the nucleotide sequence of VGAM325 RNA, herein designated VGAM RNA, also designated SEQ ID:3036.

[17127] Another function of VGAM325 is therefore inhibition of LOC144811 (Accession XM_096681). Accordingly, utilities of VGAM325 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144811. LOC92235 (Accession XM_043739) is another VGAM325 host target gene. LOC92235 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92235, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92235 BINDING SITE, designated SEQ ID:34012, to the nucleotide sequence of VGAM325 RNA, herein designated

VGAM RNA, also designated SEQ ID:3036.

[17128] Another function of VGAM325 is therefore inhibition of LOC92235 (Accession XM_043739). Accordingly, utilities of VGAM325 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92235. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 326 (VGAM326) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17129] VGAM326 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM326 was detected is described hereinabove with reference to Figs. 1–8.

[17130] VGAM326 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit Fibroma Virus. VGAM326 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17131] VGAM326 gene encodes a VGAM326 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM326 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM326 precursor RNA is designated SEQ ID:312, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:312 is located at position 66122 relative to the genome of Rabbit Fibroma Virus.

[17132] VGAM326 precursor RNA folds onto itself, forming VGAM326 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17133] An enzyme complex designated DICER COMPLEX, `dices` the VGAM326 folded precursor RNA into VGAM326 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM326 RNA is designated SEQ ID:3037, and is provided hereinbelow with reference to the sequence listing part.

[17134] VGAM326 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM326 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM326 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17135] VGAM326 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM326 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM326 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM326 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM326 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17136] The complementary binding of VGAM326 RNA, herein designated VGAM RNA, to host target binding sites on VGAM326 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM326 host target RNA into VGAM326 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17137] It is appreciated that VGAM326 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM326 host target genes. The mRNA of

each one of this plurality of VGAM326 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM326 RNA, herein designated VGAM RNA, and which when bound by VGAM326 RNA causes inhibition of translation of respective one or more VGAM326 host target proteins.

[17138] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM326 gene, herein designated VGAM GENE, on one or more VGAM326 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[17139] It is yet further appreciated that a function of VGAM326 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of viral infection by Rabbit Fibroma Virus. Specific functions, and accordingly utilities, of VGAM326 correlate with, and may be deduced from, the identity of the host target genes which VGAM326 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17140] Nucleotide sequences of the VGAM326 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM326 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM326 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM326 are further described hereinbelow with reference to Table 1.

[17141] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM326 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM326 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[17142] As mentioned hereinabove with reference to Fig. 1, a function of VGAM326 gene, herein designated VGAM is inhibition of expression of VGAM326 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM326 correlate with, and may be deduced from, the identity of the target genes which VGAM326 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17143] Activin A Receptor, Type I (ACVR1, Accession NM_001105) is a VGAM326 host target gene. ACVR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACVR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACVR1 BINDING SITE, designated SEQ ID:6764, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17144] A function of VGAM326 is therefore inhibition of Activin A Receptor, Type I (ACVR1, Accession NM_001105), a gene which Activin receptor-like kinase; similar to activin, TGF-

beta, and *C. elegans* daf-1 receptors. Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACVR1. The function of ACVR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM217. BTG Family, Member 2 (BTG2, Accession NM_006763) is another VGAM326 host target gene. BTG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BTG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTG2 BINDING SITE, designated SEQ ID:13630, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17145] Another function of VGAM326 is therefore inhibition of BTG Family, Member 2 (BTG2, Accession NM_006763). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTG2. Ceroid-lipofuscinosis, Neuronal 2, Late Infantile (Jansky-Bielschowsky disease) (CLN2, Accession NM_000391) is another VGAM326 host target gene.

CLN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLN2 BINDING SITE, designated SEQ ID:5968, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17146] Another function of VGAM326 is therefore inhibition of Ceroid-lipofuscinosis, Neuronal 2, Late Infantile (Jansky-Bielschowsky disease) (CLN2, Accession NM_000391). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLN2. Diaphanous Homolog 2 (Drosophila) (DIAPH2, Accession NM_006729) is another VGAM326 host target gene. DIAPH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DIAPH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIAPH2 BINDING SITE, designated SEQ ID:13563, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM

RNA, also designated SEQ ID:3037.

[17147] Another function of VGAM326 is therefore inhibition of Diaphanous Homolog 2 (Drosophila) (DIAPH2, Accession NM_006729), a gene which may affect in oogenesis. Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIAPH2. The function of DIAPH2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM129. Forkhead Box D2 (FOXD2, Accession NM_004474) is another VGAM326 host target gene. FOXD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FOXD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXD2 BINDING SITE, designated SEQ ID:10789, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17148] Another function of VGAM326 is therefore inhibition of Forkhead Box D2 (FOXD2, Accession NM_004474). Accordingly, utilities of VGAM326 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with FOXD2. Glutaminase (GLS, Accession NM_014905) is another VGAM326 host target gene. GLS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GLS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLS BINDING SITE, designated SEQ ID:17106, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17149] Another function of VGAM326 is therefore inhibition of Glutaminase (GLS, Accession NM_014905). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLS. Glycoprotein M6A (GPM6A, Accession NM_005277) is another VGAM326 host target gene. GPM6A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GPM6A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPM6A BINDING SITE, designated SEQ

ID:11781, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17150] Another function of VGAM326 is therefore inhibition of Glycoprotein M6A (GPM6A, Accession NM_005277), a gene which may play a role in neuronal development. Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPM6A. The function of GPM6A has been established by previous studies. Yan et al. (1993) used monoclonal antibodies raised against antigens in mouse brain fractions to isolate 2 related cDNAs from an expression library. The cDNAs, which they designated M6a and M6b (OMIM Ref. No. 300051), are highly similar to the myelin proteolipid protein (OMIM Ref. No. 300401) and are expressed during early development of the mouse central nervous system (CNS). Olinsky et al. (1996) found that the M6a gene (GPM6A) is expressed only in neurons. They obtained partial human genomic and cDNA clones for M6a and mapped the gene to 4q34 by fluorescence in situ hybridization. M6, a cell surface glycoprotein mainly expressed on neurons in the murine CNS, plays significant roles in neural cell adhesion and some aspects of neurite

growth (Lagenaur et al., 1992). Shimizu et al. (1996) isolated a human cDNA that is highly homologous to the murine gene, symbolized Gpm6, that encodes M6. The human gene, GPM6A, contains an open reading frame of 834 nucleotides encoding a peptide of 278 amino acids. Northern blot analysis revealed specific expression in human brain. By radiation hybrid mapping, Shimizu et al. (1996) assigned the GPM6A gene to 4q33–q34.

[17151] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17152] Shimizu, F.; Watanabe, T. K.; Fujiwara, T.; Takahashi, E.; Nakamura, Y.; Maekawa, H. : Isolation and mapping of the human glycoprotein M6 gene (GPM6A) to 4q33–to–q34. Cytogenet. Cell Genet. 74: 138–139, 1996. ; and

[17153] Yan, Y.; Lagenaur, C.; Narayanan, V. : Molecular cloning of M6: identification of a PLP/DM20 gene family. Neuron 11: 423–431, 1993.

[17154] Further studies establishing the function and utilities of GPM6A are found in John Hopkins OMIM database record ID 601275, and in cited publications numbered 986 and 9863 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer–

ence.5-hydroxytryptamine (serotonin) Receptor 6 (HTR6, Accession NM_000871) is another VGAM326 host target gene. HTR6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HTR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTR6 BINDING SITE, designated SEQ ID:6549, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17155] Another function of VGAM326 is therefore inhibition of 5-hydroxytryptamine (serotonin) Receptor 6 (HTR6, Accession NM_000871), a gene which stimulates adenylate cyclase. Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR6. The function of HTR6 has been established by previous studies. Rees et al. (1994) identified a serotonin receptor subtype, HTR5A, that appeared to be expressed uniquely in the central nervous system. Schanen et al. (1996) used PCR analysis of somatic cell hybrid panels and a collection of chromosome 7-specific YAC clones to map HTR5A to 7q36.1.

[17156] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [17157] Rees, S.; den Daas, I.; Foord, S.; Goodson, S.; Bull, D.; Kilpatrick, G.; Lee, M. : Cloning and characterisation of the human 5-HT5A serotonin receptor. FEBS Lett. 355: 242-246, 1994. ; and

- [17159] Further studies establishing the function and utilities of HTR6 are found in John Hopkins OMIM database record ID 601109, and in cited publications numbered 10246 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Interleukin 12 Receptor, Beta 2 (IL12RB2, Accession NM_001559) is another VGAM326 host target gene. IL12RB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL12RB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL12RB2 BINDING SITE, designated SEQ ID:7280, to the nucleotide

sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17160] Another function of VGAM326 is therefore inhibition of Interleukin 12 Receptor, Beta 2 (IL12RB2, Accession NM_001559), a gene which is involved in il-12 transduction. binds to il-12 with a low affinity. Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL12RB2. The function of IL12RB2 has been established by previous studies. Chua et al. (1994) and Presky et al. (1996) identified 2 subunits of the interleukin-12 (IL12; 161560) receptor complex designated beta-1 (OMIM Ref. No. 601604) and beta-2, respectively. Presky et al. (1996) identified IL12RB2 cDNA from a human phytohemagglutinin-activated lymphoblast library. It is an 862-amino acid type I transmembrane protein with a 595-amino acid-long extracellular domain and a cytoplasmic tail of 216 amino acids that contains 3 tyrosine residues. A cDNA encoding the mouse homolog was also isolated. The human and mouse proteins show 68% amino acid sequence identity. When expressed in COS-7 cells, IL12RB2 exists as a disulfide-linked oligomer with an apparent monomeric molecular weight of 130 kD. Functional stud-

ies indicated that high affinity IL12R is composed of at least 2 beta-type cytokine receptor subunits, each independently exhibiting low affinity for IL12. IL12RB1 is constitutively expressed on both Th1 and Th2 lymphocytes. IL12RB2 is expressed more strongly on Th1 cells, however, and can be induced by antigen receptor triggering or by IL12 and alpha-interferon (IFN α ; 147660). Using RT-PCR analysis, Kim et al. (2001) showed that IL12RB2 expression was high in lesions of tuberculoid (i.e., *M. leprae*-resistant) leprosy (see OMIM Ref. No. 246300) patients but not in lesions of lepromatous (i.e., low-resistance) patients. IL12RB1 expression was similar in both groups. Flow cytometric analysis demonstrated that tuberculoid patient T cells responded with increased expression of IL12RB1 and IL12RB2 to *M. leprae* antigen stimulation, whereas lepromatous patients upregulated expression of IL12RB1 but not IL12RB2. EMSA, supershift, and Western blot analyses indicated that IL12 stimulation induced STAT4 phosphorylation and STAT4-DNA binding in tuberculoid but not lepromatous patients. The defect in lepromatous patients was specific to *M. leprae* in that they upregulated both IL12RB1 and IL12RB2 in response to *M. tuberculosis* and activated the STAT4 pathway. ELISA anal-

ysis showed that production of IFNG (OMIM Ref. No. 147570) correlated with IL12RB2 expression in the leprosy patients. Kim et al. (2001) proposed that the Th response to antigen determines IL12RB2 expression and function in the generation of cell-mediated immunity to microbial infection

[17161] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17162] Presky, D. H.; Yang, H.; Minetti, L. J.; Chua, A. O.; Nabavi, N.; Wu, C.-Y.; Gately, M. K.; Gubler, U. : A functional interleukin 12 receptor complex is composed of two beta-type cytokine receptor subunits. Proc. Nat. Acad. Sci. 93: 14002-14007, 1996. ; and

[17163] Kim, J.; Uyemura, K.; Van Dyke, M. K.; Legaspi, A. J.; Rea, T. H.; Shuai, K.; Modlin, R. L. : A role for IL-12 receptor expression and signal transduction in host defense in leprosy. J.

[17164] Further studies establishing the function and utilities of IL12RB2 are found in John Hopkins OMIM database record ID 601642, and in cited publications numbered 4894, 6685-668 and 8854-8855 listed in the bibliography section hereinbelow, which are also hereby incorporated by

reference. Leukocyte-associated Ig-like Receptor 1 (LAIR1, Accession NM_002287) is another VGAM326 host target gene. LAIR1 BINDING SITE1 and LAIR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LAIR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAIR1 BINDING SITE1 and LAIR1 BINDING SITE2, designated SEQ ID:8068 and SEQ ID:22322 respectively, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17165] Another function of VGAM326 is therefore inhibition of Leukocyte-associated Ig-like Receptor 1 (LAIR1, Accession NM_002287), a gene which Inhibitory receptor that represses cytotoxicity of natural killer cells and of T cell clones that lack CD28; contains an immunoglobulin-like domain. Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAIR1. The function of LAIR1 has been established by previous studies. Natural killer (NK) cells are a subpopulation of lymphocytes capable of lysing transformed and virus-infected cells without appar-

ent presensitization. Inhibitory receptors present on NK cells prevent excessive inflammatory responses and autoimmunity by binding major histocompatibility complex (MHC) expressed on target cells, resulting in the NK cells selectively killing only targets that lack MHC on their surface. Two families of human NK cell inhibitory receptors are the killer cell inhibitory receptors of the immunoglobulin superfamily and the NKG2 receptors (e.g., KLRC1; 161555) of the C-type lectin superfamily. All of these inhibitory receptors possess cytoplasmic tails with immune receptor tyrosine-based inhibitory motifs (ITIMs), which bind to the SH2 domain of certain phosphatases upon phosphorylation, leading to the downregulation of cell activation. To identify molecules involved in the negative signaling of NK cells, Meyaard et al. (1997) immunized mice with a human NK cell clone and screened antibodies for the capacity to inhibit NK cell-mediated lysis of Fc receptor (FcR)-bearing targets. They isolated a monoclonal antibody that recognized LAIR1. They found that FcR crosslinking of LAIR1 was required to deliver the negative signal and that it led to inhibition of cytotoxicity even in the presence of strong positive signals. Both the SH2-containing tyrosine phosphatases SHP1 (PTPN6;

176883) and SHP2 (PTPN11; 176876) associated with tyrosine-phosphorylated LAIR1. LAIR1 does not appear to recognize class I human leukocyte antigens (HLAs). LAIR1 was expressed on the majority of human peripheral blood mononuclear leukocytes examined Using flow cytometry to screen cell lines with a LAIR1 fusion protein, Meyaard et al. (2001) identified a LAIR1 ligand on colon carcinoma cell lines. By expression cloning from a colon carcinoma cDNA library, they showed that the LAIR1 ligand is identical to EPCAM (TACSTD1; 185535). EPCAM also binds LAIR2 (OMIM Ref. No. 602993), which is 84% homologous to LAIR1 in its Ig domain. Mutation analysis determined that EPCAM interacts with the LAIRs through its first EGF-like repeat. Flow cytometry and immunohistochemical analysis demonstrated LAIR1 expression in intestinal intraepithelial cells, in close proximity to cells expressing EPCAM. Meyaard et al. (2001) proposed that EPCAM, through its interaction with the LAIR1 inhibitory receptor, is involved in preventing excessive inflammatory responses in regions, such as intestine, with high antigen exposure

[17166] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [17167] Sathish, J. G.; Johnson, K. G.; Fuller, K. J.; LeRoy, F. G.; Meyaard, L.; Sims, M. J.; Matthews, R. J. : Constitutive association of SHP-1 with leukocyte-associated Ig-like receptor-1 in human T cells. J. Immun. 166: 1763-1770, 2001. ; and

- [17169] Further studies establishing the function and utilities of LAIR1 are found in John Hopkins OMIM database record ID 602992, and in cited publications numbered 689, 540 and 5407-5408 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phospholipase A2 Receptor 1, 180kDa (PLA2R1, Accession NM_007366) is another VGAM326 host target gene. PLA2R1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLA2R1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLA2R1 BINDING SITE, designated SEQ

ID:14295, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17170] Another function of VGAM326 is therefore inhibition of Phospholipase A2 Receptor 1, 180kDa (PLA2R1, Accession NM_007366). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLA2R1. Suppressor of Cytokine Signaling 5 (SOCS5, Accession NM_014011) is another VGAM326 host target gene. SOCS5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOCS5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOCS5 BINDING SITE, designated SEQ ID:15225, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17171] Another function of VGAM326 is therefore inhibition of Suppressor of Cytokine Signaling 5 (SOCS5, Accession NM_014011). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOCS5. Transcription Fac-

tor-like 4 (TCFL4, Accession XM_032817) is another VGAM326 host target gene. TCFL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCFL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCFL4 BINDING SITE, designated SEQ ID:31769, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17172] Another function of VGAM326 is therefore inhibition of Transcription Factor-like 4 (TCFL4, Accession XM_032817), a gene which interacts with Mad and represses transcription by recruiting the Sin3A-histone deacetylase corepressor complex. Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCFL4. The function of TCFL4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172. Activity-dependent Neuroprotector (ADNP, Accession NM_015339) is another VGAM326 host target gene. ADNP BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by ADNP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADNP BINDING SITE, designated SEQ ID:17647, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17173] Another function of VGAM326 is therefore inhibition of Activity-dependent Neuroprotector (ADNP, Accession NM_015339). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADNP. Ac-like Transposable Element (ALTE, Accession NM_004729) is another VGAM326 host target gene. ALTE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALTE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALTE BINDING SITE, designated SEQ ID:11105, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17174] Another function of VGAM326 is therefore inhibition of

Ac-like Transposable Element (ALTE, Accession NM_004729). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALTE. Centaurin, Alpha 2 (CENTA2, Accession NM_018404) is another VGAM326 host target gene. CENTA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CENTA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTA2 BINDING SITE, designated SEQ ID:20444, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17175] Another function of VGAM326 is therefore inhibition of Centaurin, Alpha 2 (CENTA2, Accession NM_018404). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTA2. DKFZP434B172 (Accession XM_046264) is another VGAM326 host target gene. DKFZP434B172 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434B172, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434B172 BINDING SITE, designated SEQ ID:34702, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17176] Another function of VGAM326 is therefore inhibition of DKFZP434B172 (Accession XM_046264). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434B172. DKFZp586G0123 (Accession XM_170914) is another VGAM326 host target gene. DKFZp586G0123 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp586G0123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp586G0123 BINDING SITE, designated SEQ ID:45693, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17177] Another function of VGAM326 is therefore inhibition of DKFZp586G0123 (Accession XM_170914). Accordingly,

utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp586G0123. Ecotropic Viral Integration Site 5 (EVI5, Accession NM_005665) is another VGAM326 host target gene. EVI5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EVI5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVI5 BINDING SITE, designated SEQ ID:12213, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17178] Another function of VGAM326 is therefore inhibition of Ecotropic Viral Integration Site 5 (EVI5, Accession NM_005665). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVI5. FLJ14280 (Accession NM_024886) is another VGAM326 host target gene. FLJ14280 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14280, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14280 BINDING SITE, designated SEQ ID:24340, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17179] Another function of VGAM326 is therefore inhibition of FLJ14280 (Accession NM_024886). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14280. FLJ22127 (Accession NM_022775) is another VGAM326 host target gene. FLJ22127 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22127 BINDING SITE, designated SEQ ID:23042, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17180] Another function of VGAM326 is therefore inhibition of FLJ22127 (Accession NM_022775). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22127.

FLJ30681 (Accession XM_166291) is another VGAM326 host target gene. FLJ30681 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ30681, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30681 BINDING SITE, designated SEQ ID:44107, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17181] Another function of VGAM326 is therefore inhibition of FLJ30681 (Accession XM_166291). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30681. KIAA1831 (Accession XM_033366) is another VGAM326 host target gene. KIAA1831 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1831, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1831 BINDING SITE, designated SEQ ID:31902, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3037.

[17182] Another function of VGAM326 is therefore inhibition of KIAA1831 (Accession XM_033366). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1831. KIAA1854 (Accession XM_049884) is another VGAM326 host target gene. KIAA1854 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1854 BINDING SITE, designated SEQ ID:35534, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17183] Another function of VGAM326 is therefore inhibition of KIAA1854 (Accession XM_049884). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1854. LBP-9 (Accession NM_014553) is another VGAM326 host target gene. LBP-9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LBP-9, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LBP-9 BINDING SITE, designated SEQ ID:15875, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17184] Another function of VGAM326 is therefore inhibition of LBP-9 (Accession NM_014553). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LBP-9. Microtubule-actin Crosslinking Factor 1 (MACF1, Accession NM_012090) is another VGAM326 host target gene. MACF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MACF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MACF1 BINDING SITE, designated SEQ ID:14380, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17185] Another function of VGAM326 is therefore inhibition of Microtubule-actin Crosslinking Factor 1 (MACF1, Acces-

sion NM_012090). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MACF1. PR Domain Containing 15 (PRDM15, Accession XM_029600) is another VGAM326 host target gene. PRDM15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRDM15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM15 BINDING SITE, designated SEQ ID:30916, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17186] Another function of VGAM326 is therefore inhibition of PR Domain Containing 15 (PRDM15, Accession XM_029600). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM15. PRO1386 (Accession NM_031269) is another VGAM326 host target gene. PRO1386 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO1386, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of PRO1386 BINDING SITE, designated SEQ ID:25288, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17187] Another function of VGAM326 is therefore inhibition of PRO1386 (Accession NM_031269). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1386. SCDGF-B (Accession NM_025208) is another VGAM326 host target gene. SCDGF-B BINDING SITE1 and SCDGF-B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SCDGF-B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCDGF-B BINDING SITE1 and SCDGF-B BINDING SITE2, designated SEQ ID:24880 and SEQ ID:26982 respectively, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17188] Another function of VGAM326 is therefore inhibition of SCDGF-B (Accession NM_025208). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with SCDGF-B. TUSP (Accession NM_020245) is another VGAM326 host target gene. TUSP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TUSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUSP BINDING SITE, designated SEQ ID:21522, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17189] Another function of VGAM326 is therefore inhibition of TUSP (Accession NM_020245). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUSP. LOC124222 (Accession XM_058784) is another VGAM326 host target gene. LOC124222 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC124222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124222 BINDING SITE, designated SEQ ID:36742, to the nucleotide se-

quence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17190] Another function of VGAM326 is therefore inhibition of LOC124222 (Accession XM_058784). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124222. LOC139422 (Accession XM_066687) is another VGAM326 host target gene. LOC139422 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC139422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139422 BINDING SITE, designated SEQ ID:37343, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17191] Another function of VGAM326 is therefore inhibition of LOC139422 (Accession XM_066687). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139422. LOC145871 (Accession XM_096897) is another VGAM326 host target gene. LOC145871 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC145871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145871 BINDING SITE, designated SEQ ID:40621, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17192] Another function of VGAM326 is therefore inhibition of LOC145871 (Accession XM_096897). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145871. LOC148394 (Accession XM_097460) is another VGAM326 host target gene. LOC148394 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148394, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148394 BINDING SITE, designated SEQ ID:40881, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17193] Another function of VGAM326 is therefore inhibition of LOC148394 (Accession XM_097460). Accordingly, utilities

of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148394. LOC148534 (Accession XM_086222) is another VGAM326 host target gene. LOC148534 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148534 BINDING SITE, designated SEQ ID:38548, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17194] Another function of VGAM326 is therefore inhibition of LOC148534 (Accession XM_086222). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148534. LOC148697 (Accession XM_086276) is another VGAM326 host target gene. LOC148697 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148697, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC148697 BINDING SITE, designated SEQ ID:38574, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17195] Another function of VGAM326 is therefore inhibition of LOC148697 (Accession XM_086276). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148697. LOC164714 (Accession XM_104657) is another VGAM326 host target gene. LOC164714 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC164714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164714 BINDING SITE, designated SEQ ID:42179, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17196] Another function of VGAM326 is therefore inhibition of LOC164714 (Accession XM_104657). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164714. LOC199858 (Accession XM_114040) is another VGAM326 host target gene. LOC199858 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199858 BINDING SITE, designated SEQ ID:42640, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17197] Another function of VGAM326 is therefore inhibition of LOC199858 (Accession XM_114040). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199858. LOC200982 (Accession XM_117305) is another VGAM326 host target gene. LOC200982 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200982, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200982 BINDING SITE, designated SEQ ID:43377, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17198] Another function of VGAM326 is therefore inhibition of

LOC200982 (Accession XM_117305). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200982. LOC255714 (Accession XM_172861) is another VGAM326 host target gene. LOC255714 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255714 BINDING SITE, designated SEQ ID:46141, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17199] Another function of VGAM326 is therefore inhibition of LOC255714 (Accession XM_172861). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255714. LOC57228 (Accession NM_020467) is another VGAM326 host target gene. LOC57228 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC57228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC57228 BINDING SITE, designated SEQ ID:21707, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17200] Another function of VGAM326 is therefore inhibition of LOC57228 (Accession NM_020467). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57228. LOC91531 (Accession XM_038998) is another VGAM326 host target gene. LOC91531 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91531, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91531 BINDING SITE, designated SEQ ID:32973, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:3037.

[17201] Another function of VGAM326 is therefore inhibition of LOC91531 (Accession XM_038998). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91531. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 327 (VGAM327) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17202] VGAM327 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM327 was detected is described hereinabove with reference to Figs. 1–8.

[17203] VGAM327 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit Fibroma Virus. VGAM327 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17204] VGAM327 gene encodes a VGAM327 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM327 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM327 precursor RNA is designated SEQ ID:313, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:313 is

located at position 66535 relative to the genome of Rabbit Fibroma Virus.

[17205] VGAM327 precursor RNA folds onto itself, forming VGAM327 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17206] An enzyme complex designated DICER COMPLEX, `dices` the VGAM327 folded precursor RNA into VGAM327 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM327 RNA is designated SEQ ID:3038, and is provided hereinbelow with reference to the sequence listing part.

[17207] VGAM327 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM327 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM327 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[17208] VGAM327 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM327 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM327 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM327 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM327 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[17209] The complementary binding of VGAM327 RNA, herein designated VGAM RNA, to host target binding sites on VGAM327 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM327 host target RNA into VGAM327 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17210] It is appreciated that VGAM327 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM327 host target genes. The mRNA of each one of this plurality of VGAM327 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM327 RNA, herein designated VGAM RNA, and which when bound by VGAM327 RNA causes inhibition of translation of respective one or more VGAM327

host target proteins.

[17211] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM327 gene, herein designated VGAM GENE, on one or more VGAM327 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17212] It is yet further appreciated that a function of VGAM327 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM327 include diagnosis, prevention and treatment of viral infection by Rabbit Fibroma Virus. Spe-

cific functions, and accordingly utilities, of VGAM327 correlate with, and may be deduced from, the identity of the host target genes which VGAM327 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17213] Nucleotide sequences of the VGAM327 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM327 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM327 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM327 are further described hereinbelow with reference to Table 1.

[17214] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM327 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM327 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17215] As mentioned hereinabove with reference to Fig. 1, a function of VGAM327 gene, herein designated VGAM is inhibition of expression of VGAM327 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM327 correlate with, and may be deduced from, the identity of the target genes which VGAM327 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17216] Endometrial Bleeding Associated Factor (left-right determination, factor A; transforming growth factor beta superfamily) (EBAF, Accession XM_037302) is a VGAM327 host target gene. EBAF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EBAF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EBAF BINDING SITE, designated SEQ ID:32609, to the nucleotide sequence of VGAM327 RNA, herein designated VGAM RNA, also designated SEQ ID:3038.

[17217] A function of VGAM327 is therefore inhibition of Endometrial Bleeding Associated Factor (left-right determination, factor A; transforming growth factor beta superfamily) (EBAF, Accession XM_037302), a gene which LEFT-RIGHT AXIS MALFORMATIONS. Accordingly, utilities of VGAM327 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EBAF. The function

of EBAF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM93.N-ethylmaleimide-sensitive Factor Attachment Protein, Beta (NAPB, Accession XM_046652) is another VGAM327 host target gene. NAPB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NAPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAPB BINDING SITE, designated SEQ ID:34766, to the nucleotide sequence of VGAM327 RNA, herein designated VGAM RNA, also designated SEQ ID:3038.

[17218] Another function of VGAM327 is therefore inhibition of N-ethylmaleimide-sensitive Factor Attachment Protein, Beta (NAPB, Accession XM_046652). Accordingly, utilities of VGAM327 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAPB. Protein Tyrosine Phosphatase, Non-receptor Type 1 (PTPN1, Accession NM_002827) is another VGAM327 host target gene. PTPN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by PTPN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPN1 BINDING SITE, designated SEQ ID:8701, to the nucleotide sequence of VGAM327 RNA, herein designated VGAM RNA, also designated SEQ ID:3038.

[17219] Another function of VGAM327 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type 1 (PTPN1, Accession NM_002827), a gene which is a non-receptor type 1 protein tyrosine phosphatase and inhibits insulin signaling. Accordingly, utilities of VGAM327 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPN1. The function of PTPN1 has been established by previous studies. PTP1B inhibits insulin signaling and, when overexpressed, plays a role in insulin resistance (Ahmad et al., 1997). In the 3-prime untranslated region of the PTP1B gene, Di Paola et al. (2002) identified a 1484insG variation (176885.0001) that, in 2 different populations, was associated with several features of insulin resistance. Similar data were obtained in a family-based association study by use of sib pairs discordant for genotype (Gu et al., 2000).

Subjects carrying the 1484insG variant showed PTP1B mRNA overexpression in skeletal muscle. PTP1B mRNA stability was significantly higher in human embryonic kidney cells transfected with 1484insG PTP1B as compared with those transfected with wildtype PTP1B. The data indicated that the 1484insG allele causes PTP1B overexpression and plays a role in insulin resistance. Therefore, individuals carrying the 1484insG variant might particularly benefit from PTP1B inhibitors in the treatment of insulin resistance (Kennedy and Ramachandran, 2000). Animal model experiments lend further support to the function of PTPN1. Elchebly et al. (1999) generated PTP1B-deficient mice by targeted disruption of the mouse homolog of the PTP1B gene. Mice were phenotypically and pathologically normal and had normal life span. In the fed state, homozygous mutant mice had slightly lower blood glucose concentrations, and half the circulating insulin concentrations, of wildtype littermates. The enhanced insulin sensitivity of PTP1B-deficient mice was also evident in glucose- and insulin-tolerance tests. After insulin injection, deficient mice showed increased phosphorylation of the insulin receptor in liver and muscle tissue compared to wildtype mice. On a high-fat diet, PTP1B-deficient mice

were resistant to weight gain and remained insulin sensitive, while wildtype mice rapidly gained weight and became insulin resistant. These results suggested a major role for PTP1B in modulation of insulin sensitivity and fuel metabolism. The authors proposed PTP1B as a potential therapeutic target for the treatment of type 2 diabetes and obesity.

[17220] It is appreciated that the abovementioned animal model for PTPN1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[17221] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17222] Elchebly, M.; Payette, P.; Michaliszyn, E.; Cromlish, W.; Collins, S.; Loy, A. L.; Normandin, D.; Cheng, A.; Himms-Hagen, J.; Chan, C.-C.; Ramachandran, C.; Gresser, M. J.; Tremblay, M. L.; Kennedy, B. P. : Increased insulin sensitivity and obesity resistance in mice lacking the protein tyrosine phosphatase-1B gene. Science 283: 1544-1548, 1999. ; and

[17224] Further studies establishing the function and utilities of PTPN1 are found in John Hopkins OMIM database record ID 176885, and in cited publications numbered 10896–10899, 10698–10575, 10890, 1057 and 10579 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0960 (Accession XM_166543) is another VGAM327 host target gene. KIAA0960 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0960 BINDING SITE, designated SEQ ID:44514, to the nucleotide sequence of VGAM327 RNA, herein designated VGAM RNA, also designated SEQ ID:3038.

[17225] Another function of VGAM327 is therefore inhibition of KIAA0960 (Accession XM_166543). Accordingly, utilities of VGAM327 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0960. LOC158187 (Accession XM_098892) is another VGAM327 host target gene. LOC158187 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158187, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158187 BINDING SITE, designated SEQ ID:41920, to the nucleotide sequence of VGAM327 RNA, herein designated VGAM RNA, also designated SEQ ID:3038.

[17226] Another function of VGAM327 is therefore inhibition of LOC158187 (Accession XM_098892). Accordingly, utilities of VGAM327 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158187. LOC90620 (Accession XM_032986) is another VGAM327 host target gene. LOC90620 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90620, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90620 BINDING SITE, designated SEQ ID:31805, to the nucleotide sequence of VGAM327 RNA, herein designated VGAM RNA, also designated SEQ ID:3038.

[17227] Another function of VGAM327 is therefore inhibition of

LOC90620 (Accession XM_032986). Accordingly, utilities of VGAM327 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90620. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 328 (VGAM328) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17228] VGAM328 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM328 was detected is described hereinabove with reference to Figs. 1–8.

[17229] VGAM328 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit Fibroma Virus. VGAM328 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17230] VGAM328 gene encodes a VGAM328 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM328 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM328 precursor RNA is designated SEQ ID:314, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:314 is located at position 68066 relative to the genome of Rabbit Fibroma Virus.

[17231] VGAM328 precursor RNA folds onto itself, forming VGAM328 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17232] An enzyme complex designated DICER COMPLEX, `dices` the VGAM328 folded precursor RNA into VGAM328 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide se-

quence of VGAM328 RNA is designated SEQ ID:3039, and is provided hereinbelow with reference to the sequence listing part.

[17233] VGAM328 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM328 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM328 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[17234] VGAM328 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM328 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM328 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM328 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM328 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[17235] The complementary binding of VGAM328 RNA, herein designated VGAM RNA, to host target binding sites on VGAM328 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM328 host target RNA into VGAM328 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17236] It is appreciated that VGAM328 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM328 host target genes. The mRNA of each one of this plurality of VGAM328 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM328 RNA, herein designated VGAM RNA, and which when bound by VGAM328 RNA causes inhibition of translation of respective one or more VGAM328 host target proteins.

[17237] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM328 gene, herein designated VGAM GENE, on one or more VGAM328 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17238] It is yet further appreciated that a function of VGAM328 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM328 include diagnosis, prevention and treatment of viral infection by Rabbit Fibroma Virus. Specific functions, and accordingly utilities, of VGAM328 correlate with, and may be deduced from, the identity of the host target genes which VGAM328 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17239] Nucleotide sequences of the VGAM328 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM328 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM328 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM328 are further described hereinbelow with reference to Table 1.

[17240] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM328 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM328 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17241] As mentioned hereinabove with reference to Fig. 1, a function of VGAM328 gene, herein designated VGAM is inhibition of expression of VGAM328 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM328 correlate with, and may be deduced from, the identity of the target genes which VGAM328 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17242] Chemokine (C-X3-C motif) Receptor 1 (CX3CR1, Accession XM_047502) is a VGAM328 host target gene. CX3CR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CX3CR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CX3CR1 BINDING SITE, designated SEQ ID:34973, to the nucleotide sequence of VGAM328 RNA, herein designated VGAM RNA, also designated SEQ ID:3039.

[17243] A function of VGAM328 is therefore inhibition of Chemokine (C-X3-C motif) Receptor 1 (CX3CR1, Accession XM_047502), a gene which mediates both the adhesive and migratory functions of fractalkine. Accordingly,

utilities of VGAM328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CX3CR1. The function of CX3CR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25. Endoglin (Osler–Rendu–Weber syndrome 1) (ENG, Accession NM_000118) is another VGAM328 host target gene. ENG BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ENG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENG BINDING SITE, designated SEQ ID:5589, to the nucleotide sequence of VGAM328 RNA, herein designated VGAM RNA, also designated SEQ ID:3039.

[17244] Another function of VGAM328 is therefore inhibition of Endoglin (Osler–Rendu–Weber syndrome 1) (ENG, Accession NM_000118). Accordingly, utilities of VGAM328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENG. Myeloid/lymphoid Or Mixed–lineage Leukemia (trithorax homolog, *Drosophila*); Translocated To, 3 (MLLT3, Accession

NM_004529) is another VGAM328 host target gene.

MLLT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MLLT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLLT3 BINDING SITE, designated SEQ ID:10866, to the nucleotide sequence of VGAM328 RNA, herein designated VGAM RNA, also designated SEQ ID:3039.

[17245] Another function of VGAM328 is therefore inhibition of Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 3 (MLLT3, Accession NM_004529), a gene which is Serine and proline rich protein. Accordingly, utilities of VGAM328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLLT3. The function of MLLT3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM67. Transforming Growth Factor, Alpha (TGFA, Accession NM_003236) is another VGAM328 host target gene. TGFA BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by TGFA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFA BINDING SITE, designated SEQ ID:9230, to the nucleotide sequence of VGAM328 RNA, herein designated VGAM RNA, also designated SEQ ID:3039.

[17246] Another function of VGAM328 is therefore inhibition of Transforming Growth Factor, Alpha (TGFA, Accession NM_003236), a gene which is able to bind to the egf receptor and to act synergistically with tgfbeta to promote anchorage-independent cell proliferation in soft agar. Accordingly, utilities of VGAM328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFA. The function of TGFA has been established by previous studies. Ellis et al. (1987) presented evidence that TGFA plays a role in certain paraneoplastic manifestations of melanoma: the sign of Leser-Trelat (the sudden appearance of, or increase in the number and size of, seborrheic keratoses), acanthosis nigricans, and eruptive acrochordons (sudden onset of multiple skin tags). Fernandez-Larrea et al. (1999) used the 2-hybrid screen to identify pro-TGF-alpha cytoplasmic domain-binding

proteins, which they referred to as TACIPs (pro-TGF- α cytoplasmic domain-interacting proteins), involved in the trafficking of pro-TGF- α . They cloned 2 such proteins, which they designated TACIP1 (OMIM Ref. No. 601017) and TACIP18 (OMIM Ref. No. 602217). The circadian clock in the suprachiasmatic nucleus is thought to drive daily rhythms of behavior by secreting factors that act locally within the hypothalamus. In a systematic screen, Kramer et al. (2001) identified TGFA as a likely suprachiasmatic nucleus inhibitor of locomotion. TGFA is expressed rhythmically in the suprachiasmatic nucleus, and when infused into the third ventricle it reversibly inhibited locomotor activity and disrupted circadian sleep-wake cycles. These actions were mediated by EGF receptors on neurons in the hypothalamic subparaventricular zone. Mice with a hypomorphic EGF receptor mutation exhibited excessive daytime locomotor activity and failed to suppress activity when exposed to light. Kramer et al. (2001) concluded that their results implicate EGF receptor signaling in the daily control of locomotor activity. They identified a neural circuit in the hypothalamus that likely mediates the regulation of behavior both by the suprachiasmatic nucleus and the retina using TGFA and EGF re-

ceptors in the retinohypothalamic tract.

[17247] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17248] Fernandez-Larrea, J.; Merlos-Suarez, A.; Urena, J. M.; Baselga, J.; Arribas, J. : A role for a PDZ protein in the early secretory pathway for the targeting of proTGF- α to the cell surface. *Molec. Cell* 3: 423-433, 1999. ; and

[17249] Kramer, A.; Yang, F.-C.; Snodgrass, P.; Li, X.; Scammell, T. E.; Davis, F. C.; Weitz, C. J. : Regulation of daily locomotor activity and sleep by hypothalamic EGF receptor signaling. *S.*

[17250] Further studies establishing the function and utilities of TGFA are found in John Hopkins OMIM database record ID 190170, and in cited publications numbered 2705-2709, 37 and 2710-2712 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ10388 (Accession NM_018082) is another VGAM328 host target gene. FLJ10388 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10388, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ10388 BINDING SITE, designated SEQ ID:19841, to the nucleotide sequence of VGAM328 RNA, herein designated VGAM RNA, also designated SEQ ID:3039.

[17251] Another function of VGAM328 is therefore inhibition of FLJ10388 (Accession NM_018082). Accordingly, utilities of VGAM328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10388. HT002 (Accession NM_014066) is another VGAM328 host target gene. HT002 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HT002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HT002 BINDING SITE, designated SEQ ID:15278, to the nucleotide sequence of VGAM328 RNA, herein designated VGAM RNA, also designated SEQ ID:3039.

[17252] Another function of VGAM328 is therefore inhibition of HT002 (Accession NM_014066). Accordingly, utilities of VGAM328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HT002. KIAA1831 (Accession XM_033366) is another VGAM328

host target gene. KIAA1831 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1831, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1831 BINDING SITE, designated SEQ ID:31901, to the nucleotide sequence of VGAM328 RNA, herein designated VGAM RNA, also designated SEQ ID:3039.

[17253] Another function of VGAM328 is therefore inhibition of KIAA1831 (Accession XM_033366). Accordingly, utilities of VGAM328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1831. MGC3251 (Accession NM_032016) is another VGAM328 host target gene. MGC3251 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC3251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3251 BINDING SITE, designated SEQ ID:25730, to the nucleotide sequence of VGAM328 RNA, herein designated VGAM RNA, also designated SEQ ID:3039.

[17254] Another function of VGAM328 is therefore inhibition of MGC3251 (Accession NM_032016). Accordingly, utilities of VGAM328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3251. LOC149134 (Accession XM_097594) is another VGAM328 host target gene. LOC149134 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149134, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149134 BINDING SITE, designated SEQ ID:40956, to the nucleotide sequence of VGAM328 RNA, herein designated VGAM RNA, also designated SEQ ID:3039.

[17255] Another function of VGAM328 is therefore inhibition of LOC149134 (Accession XM_097594). Accordingly, utilities of VGAM328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149134. LOC220074 (Accession NM_145309) is another VGAM328 host target gene. LOC220074 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220074, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220074 BINDING SITE, designated SEQ ID:29824, to the nucleotide sequence of VGAM328 RNA, herein designated VGAM RNA, also designated SEQ ID:3039.

[17256] Another function of VGAM328 is therefore inhibition of LOC220074 (Accession NM_145309). Accordingly, utilities of VGAM328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220074. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 329 (VGAM329) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17257] VGAM329 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM329 was detected is described hereinabove with reference to Figs. 1–8.

[17258] VGAM329 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit Fibroma Virus. VGAM329 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[17259] VGAM329 gene encodes a VGAM329 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM329 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM329 precursor RNA is designated SEQ ID:315, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:315 is located at position 76498 relative to the genome of Rabbit Fibroma Virus.

[17260] VGAM329 precursor RNA folds onto itself, forming VGAM329 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17261] An enzyme complex designated DICER COMPLEX, `dices` the VGAM329 folded precursor RNA into VGAM329 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM329 RNA is designated SEQ ID:3040, and is provided hereinbelow with reference to the sequence listing part.

[17262] VGAM329 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM329 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM329 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17263] VGAM329 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM329 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM329 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM329 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM329 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17264] The complementary binding of VGAM329 RNA, herein designated VGAM RNA, to host target binding sites on VGAM329 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM329 host target RNA into VGAM329 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[17265] It is appreciated that VGAM329 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM329 host target genes. The mRNA of each one of this plurality of VGAM329 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM329 RNA, herein designated VGAM RNA, and which when bound by VGAM329 RNA causes inhibition of translation of respective one or more VGAM329 host target proteins.

[17266] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM329 gene, herein designated VGAM GENE, on one or more VGAM329 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17267] It is yet further appreciated that a function of VGAM329 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of viral infection by Rabbit Fibroma Virus. Specific functions, and accordingly utilities, of VGAM329 correlate with, and may be deduced from, the identity of the host target genes which VGAM329 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17268] Nucleotide sequences of the VGAM329 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM329 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM329 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM329 are further described hereinbelow with reference to Table 1.

[17269] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM329 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM329 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17270] As mentioned hereinabove with reference to Fig. 1, a function of VGAM329 gene, herein designated VGAM is inhibition of expression of VGAM329 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM329 correlate with, and may be deduced from, the identity of the target genes which VGAM329 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17271] Adaptor-related Protein Complex 1, Gamma 1 Subunit (AP1G1, Accession NM_001128) is a VGAM329 host target gene. AP1G1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AP1G1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP1G1 BINDING SITE, designated SEQ ID:6802, to the nucleotide sequence of VGAM329 RNA,

herein designated VGAM RNA, also designated SEQ ID:3040.

[17272] A function of VGAM329 is therefore inhibition of Adaptor-related Protein Complex 1, Gamma 1 Subunit (AP1G1, Accession NM_001128), a gene which promotes the formation of clathrin-coated pits and vesicles. Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1G1. The function of AP1G1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM316. B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM_022898) is another VGAM329 host target gene. BCL11B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL11B BINDING SITE, designated SEQ ID:23170, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17273] Another function of VGAM329 is therefore inhibition of B-

cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM_022898). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL11B. Calcium Channel, Voltage-dependent, L Type, Alpha 1C Subunit (CACNA1C, Accession NM_000719) is another VGAM329 host target gene. CACNA1C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CACNA1C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNA1C BINDING SITE, designated SEQ ID:6382, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17274] Another function of VGAM329 is therefore inhibition of Calcium Channel, Voltage-dependent, L Type, Alpha 1C Subunit (CACNA1C, Accession NM_000719), a gene which is alpha-1 subunit of DHP-sensitive calcium channels from cardiac muscle and the brain. Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNA1C. The function of CACNA1C and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM182. Centrosomal Protein 2 (CEP2, Accession NM_007186) is another VGAM329 host target gene. CEP2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CEP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEP2 BINDING SITE, designated SEQ ID:14044, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17275] Another function of VGAM329 is therefore inhibition of Centrosomal Protein 2 (CEP2, Accession NM_007186), a gene which interacts with TC10 and CDC42. Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEP2. The function of CEP2 has been established by previous studies. Using a yeast 2-hybrid screen on a mouse embryo cDNA library with TC10 (OMIM Ref. No. 605857) as the bait, followed by EST database searching, Joberty et al. (1999) identified cDNAs encoding human and mouse BORG1 (CEP2), BORG2 (CEP3; 606133), BORG3

(CEP5), BORG4 (CEP4; 605468), and BORG5 (CEP1). Sequence analysis predicted that the 210-amino acid BORG1 protein contains a CRIB motif followed by a conserved 12-residue BORG homology-1 (BH1) domain in its N terminus; an 11-amino acid BH2 domain in its central region; and a 22-residue BH3 domain in its C terminus. Northern blot analysis detected ubiquitous but variable expression of 1.8- and 2.0-kb BORG1 transcripts, with high levels in heart and low levels in pancreas and liver. By binding analysis, Joberty et al. (1999) confirmed that BORG1 interacts with TC10 and CDC42. Immunofluorescence microscopy demonstrated cytoplasmic expression of BORG1. BORG1 expression caused no dramatic changes in cell shape and a reduced abundance of stress fibers. Coexpression of BORG1 with CDC42 resulted in cells showing a 'porcupine' phenotype characterized by an abundance of actin-filled spikes. By EST database searching with CEP1 as the probe, Hirsch et al. (2001) identified cDNAs encoding several CEPs, including CEP2. They referred to the BH2 and BH3 domains as CI and CII, respectively, and considered the BH1 domain to be part of an extended CRIB motif. Hirsch et al. (2001) proposed that these motifs are potential signaling domains. Fluores-

cence microscopy demonstrated cytoplasmic and membrane expression of CEP2 in keratinocytes, with notable localization in a perinuclear cytoplasmic compartment

[17276] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17277] Hirsch, D. S.; Pirone, D. M.; Burbelo, P. D. : A new family of Cdc42 effector proteins, CEPs, function in fibroblast and epithelial cell shape changes. J. Biol. Chem. 276: 875–883, 2001. ; and

[17278] Joberty, G.; Perlungher, R. R.; Macara, I. G. : The Borgs, a new family of Cdc42 and TC10 GTPase–interacting proteins. Molec. Cell. Biol. 19: 6585–6597, 1999.

[17279] Further studies establishing the function and utilities of CEP2 are found in John Hopkins OMIM database record ID 606132, and in cited publications numbered 6641–664 and 6471 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromodomain Helicase DNA Binding Protein 2 (CHD2, Accession NM_001271) is another VGAM329 host target gene. CHD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHD2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHD2 BINDING SITE, designated SEQ ID:6937, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17280] Another function of VGAM329 is therefore inhibition of Chromodomain Helicase DNA Binding Protein 2 (CHD2, Accession NM_001271). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHD2. Disrupted In Schizophrenia 1 (DISC1, Accession NM_018662) is another VGAM329 host target gene. DISC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DISC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DISC1 BINDING SITE, designated SEQ ID:20737, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17281] Another function of VGAM329 is therefore inhibition of Disrupted In Schizophrenia 1 (DISC1, Accession

NM_018662), a gene which has globular N-terminal domain(s) and a helical C-terminal domain. Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DISC1. The function of DISC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Eukaryotic Translation Initiation Factor 2C, 1 (EIF2C1, Accession NM_012199) is another VGAM329 host target gene. EIF2C1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF2C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF2C1 BINDING SITE, designated SEQ ID:14506, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17282] Another function of VGAM329 is therefore inhibition of Eukaryotic Translation Initiation Factor 2C, 1 (EIF2C1, Accession NM_012199), a gene which plays an important role in the eukaryotic peptide chain initiation process. Accordingly, utilities of VGAM329 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with EIF2C1. The function of EIF2C1 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM118. Ficolin (collagen/fibrinogen domain containing) 3 (Hakata antigen) (FCN3, Accession NM_003665) is another VGAM329 host target gene. FCN3 BINDING SITE1 and FCN3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FCN3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FCN3 BINDING SITE1 and FCN3 BINDING SITE2, designated SEQ ID:9745 and SEQ ID:9746 respectively, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17283] Another function of VGAM329 is therefore inhibition of Ficolin (collagen/fibrinogen domain containing) 3 (Hakata antigen) (FCN3, Accession NM_003665). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCN3. Matrix Metalloproteinase 14 (membrane-inserted)

(MMP14, Accession NM_004995) is another VGAM329 host target gene. MMP14 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MMP14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP14 BINDING SITE, designated SEQ ID:11436, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17284] Another function of VGAM329 is therefore inhibition of Matrix Metalloproteinase 14 (membrane-inserted) (MMP14, Accession NM_004995). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP14. Membrane-spanning 4-domains, Subfamily A, Member 4 (MS4A4A, Accession NM_024021) is another VGAM329 host target gene. MS4A4A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MS4A4A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MS4A4A BINDING SITE,

designated SEQ ID:23450, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17285] Another function of VGAM329 is therefore inhibition of Membrane-spanning 4-domains, Subfamily A, Member 4 (MS4A4A, Accession NM_024021), a gene which binds to the fc region of immunoglobulins epsilon. high affinity receptor. initiating the allergic response. Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MS4A4A. The function of MS4A4A has been established by previous studies. By EST database searching for homologs of CD20 (MS4A1; 112210), Ishibashi et al. (2001) isolated a cDNA encoding MS4A4A, which they called MS4A4. The deduced 205-amino acid protein has a conserved phosphorylation site at the intracellular loop. Northern blot analysis revealed weak expression in mouse colon and intestine but detected no expression in human tissues. Liang and Tedder (2001) also obtained a cDNA encoding MS4A4A. The predicted 220-amino acid protein is more than 40% identical to its mouse homologs. PCR analysis detected variable expression of MS4A4A in cDNA from multiple hemopoietic cell lines.

[17286] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17287] Ishibashi, K.; Suzuki, M.; Sasaki, S.; Imai, M. : Identification of a new multigene four-transmembrane family (MS4A) related to CD20, HTm4 and beta subunit of the high-affinity IgE receptor. Gene 264: 87-93, 2001. ; and

[17288] Liang, Y.; Tedder, T. F. : Identification of a CD20-, Fc-epsilon-RI-beta-related gene family: sixteen new MS4A family members expressed in human and mouse. Genomics 72: 119-127, 2001.

[17289] Further studies establishing the function and utilities of MS4A4A are found in John Hopkins OMIM database record ID 606547, and in cited publications numbered 4538-4539 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Neogenin Homolog 1 (chicken) (NEO1, Accession NM_002499) is another VGAM329 host target gene. NEO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEO1 BIND-

ING SITE, designated SEQ ID:8320, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17290] Another function of VGAM329 is therefore inhibition of Neogenin Homolog 1 (chicken) (NEO1, Accession NM_002499), a gene which regulates the transition of undifferentiated proliferating cells to their differentiated state. Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEO1. The function of NEO1 has been established by previous studies. Vielmetter et al. (1994) identified a protein with roughly 50% amino acid identity to DCC (OMIM Ref. No. 120470); it showed a dynamic pattern of expression in the developing nervous system and gastrointestinal tract of the chicken. They termed this protein neogenin. Specifically, neogenin was induced in neural cells immediately before cell cycle withdrawal and terminal differentiation. Meyerhardt et al. (1997) cloned the human neogenin gene (symbolized NGN by them) and explored its possible role in cancer. They found cDNAs for 2 alternatively spliced forms of NGN, encoding proteins of 1,461 and 1,408 amino acids. By fluorescence in situ hybridization (FISH) they localized NGN in

15q22, a region infrequently affected by alterations in cancer. NGN transcripts of about 7.5 and 5.5 kb were detected in all adult tissues studied. In contrast to the frequent loss of DCC expression in cancers, no alterations in NGN expression were observed in more than 50 cancers studied, including glioblastoma, medulloblastoma, neuroblastoma, colorectal, breast, cervical, and pancreatic cancer cell lines, and xenografts. Based on their sequence conservation and similar expression during development, Meyerhardt et al. (1997) concluded that DCC and NGN may have related functions; however, the chromosomal location and ubiquitous expression of NGN in various human tumors suggested it is infrequently altered in cancer. Vielmetter et al. (1997) also cloned and characterized human neogenin, and symbolized the gene NEO1. They mapped NEO1 to 15q22.3–q23 by FISH.

[17291] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17292] Meyerhardt, J. A.; Look, A. T.; Bigner, S. H.; Fearon, E. R. : Identification and characterization of neogenin, a DCC-related gene. *Oncogene* 14: 1129–1136, 1997. ; and

[17293] Vielmetter, J.; Kayyem, J. F.; Roman, J. M.; Dreyer, W. J. :

Neogenin, an avian cell surface protein expressed during terminal neuronal differentiation, is closely related to the human.

[17294] Further studies establishing the function and utilities of NEO1 are found in John Hopkins OMIM database record ID 601907, and in cited publications numbered 8889–8891 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Promyelocytic Leukemia (PML, Accession NM_033240) is another VGAM329 host target gene. PML BINDING SITE1 and PML BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PML, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PML BINDING SITE1 and PML BINDING SITE2, designated SEQ ID:27081 and SEQ ID:27085 respectively, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17295] Another function of VGAM329 is therefore inhibition of Promyelocytic Leukemia (PML, Accession NM_033240). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with PML. Signal Transducer and Activator of Transcription 3 (acute-phase response factor) (STAT3, Accession NM_003150) is another VGAM329 host target gene. STAT3 BINDING SITE1 and STAT3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by STAT3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAT3 BINDING SITE1 and STAT3 BINDING SITE2, designated SEQ ID:9122 and SEQ ID:29269 respectively, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17296] Another function of VGAM329 is therefore inhibition of Signal Transducer and Activator of Transcription 3 (acute-phase response factor) (STAT3, Accession NM_003150), a gene which carries out a dual function: signal transduction and activation of transcription. Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAT3. The function of STAT3 has been established by previous studies. Akira et al. (1994) purified acute-phase response factor (APRF), also designated

STAT3, and cloned the cDNA. At the amino acid level, APRF exhibited 52.5% overall homology with p91, a component of the interferon (IFN)-stimulated gene factor-3 complexes. Also see STAT1 (OMIM Ref. No. 600555).

Caldenhoven et al. (1996) reported the cloning of a cDNA encoding a variant of the transcription factor STAT3, designated STAT3-beta, that was isolated by screening an eosinophil cDNA library. Compared to wildtype STAT3, STAT3-beta lacks an internal domain of 50 bp located near the C terminus. This splice product is a naturally occurring isoform of STAT3 and encodes an 80-kD protein. Animal model experiments lend further support to the function of STAT3. Alternative splicing of the STAT3 gene produces 2 isoforms, STAT3-alpha and a dominant-negative variant, STAT3-beta. In STAT3-beta, the 55 C-terminal residues of STAT3-alpha, spanning the intrinsic transactivation domain, are replaced by 7 distinct residues. Yoo et al. (2002) generated Stat3-beta-deficient mice by gene targeting. Despite intact expression and phosphorylation of Stat3-alpha, overall Stat3 activity was impaired in Stat3-beta -/- cells. Global comparison of transcription in Stat3-beta +/+ and Stat3-beta -/- cells revealed stable differences. Stat3-beta-deficient mice ex-

hibited diminished recovery from endotoxic shock and hyperresponsiveness of a subset of endotoxin-inducible genes in liver. The hepatic response to endotoxin in wild-type mice was accompanied by a transient increase in the ratio of Stat3-beta to Stat3-alpha. These findings indicated a critical role for Stat3-beta in the control of systemic inflammation.

[17297] It is appreciated that the abovementioned animal model for STAT3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[17298] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17299] Caldenhoven, E.; van Dijk, T. B.; Solari, R.; Armstrong, J.; Raaijmakers, J. A. M.; Lammers, J.-W. J.; Koenderman, L.; de Groot, R. P. : STAT3-beta, a splice variant of transcription factor STAT3, is a dominant negative regulator of transcription. J. Biol. Chem. 271: 13221-13227, 1996. ; and

[17300] Yoo, J.-Y.; Huso, D. L.; Nathans, D.; Desiderio, S. : Specific ablation of Stat3-beta distorts the pattern of Stat3-responsive gene expression and impairs recovery

from endotoxic shock.

[17301] Further studies establishing the function and utilities of STAT3 are found in John Hopkins OMIM database record ID 102582, and in cited publications numbered 2339–2343, 3613, 3381, 360 and 9453 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CCCTC-binding Factor (zinc finger protein)-like (CTCFL, Accession XM_092717) is another VGAM329 host target gene. CTCFL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CTCFL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTCFL BINDING SITE, designated SEQ ID:40139, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17302] Another function of VGAM329 is therefore inhibition of CCCTC-binding Factor (zinc finger protein)-like (CTCFL, Accession XM_092717). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTCFL. CYB5-M (Accession XM_170554) is another VGAM329 host target

gene. CYB5-M BINDING SITE1 and CYB5-M BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CYB5-M, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYB5-M BINDING SITE1 and CYB5-M BINDING SITE2, designated SEQ ID:45378 and SEQ ID:24952 respectively, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17303] Another function of VGAM329 is therefore inhibition of CYB5-M (Accession XM_170554). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYB5-M. Dual Specificity Phosphatase 14 (DUSP14, Accession NM_007026) is another VGAM329 host target gene. DUSP14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DUSP14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUSP14 BINDING SITE, designated SEQ ID:13884, to the nucleotide sequence of VGAM329 RNA,

herein designated VGAM RNA, also designated SEQ ID:3040.

[17304] Another function of VGAM329 is therefore inhibition of Dual Specificity Phosphatase 14 (DUSP14, Accession NM_007026). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUSP14. Epiregulin (EREG, Accession NM_001432) is another VGAM329 host target gene. EREG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EREG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EREG BINDING SITE, designated SEQ ID:7157, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17305] Another function of VGAM329 is therefore inhibition of Epiregulin (EREG, Accession NM_001432). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EREG. FLJ10276 (Accession NM_018045) is another VGAM329 host target gene. FLJ10276 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ10276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10276 BINDING SITE, designated SEQ ID:19793, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17306] Another function of VGAM329 is therefore inhibition of FLJ10276 (Accession NM_018045). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10276. FLJ10315 (Accession NM_018056) is another VGAM329 host target gene. FLJ10315 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10315, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10315 BINDING SITE, designated SEQ ID:19819, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17307] Another function of VGAM329 is therefore inhibition of FLJ10315 (Accession NM_018056). Accordingly, utilities of

VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10315. FLJ10811 (Accession NM_018228) is another VGAM329 host target gene. FLJ10811 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10811, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10811 BINDING SITE, designated SEQ ID:20166, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17308] Another function of VGAM329 is therefore inhibition of FLJ10811 (Accession NM_018228). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10811. FLJ11336 (Accession NM_018393) is another VGAM329 host target gene. FLJ11336 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ11336, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11336 BINDING SITE,

designated SEQ ID:20431, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17309] Another function of VGAM329 is therefore inhibition of FLJ11336 (Accession NM_018393). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11336. FLJ21865 (Accession NM_022759) is another VGAM329 host target gene. FLJ21865 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21865 BINDING SITE, designated SEQ ID:23002, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17310] Another function of VGAM329 is therefore inhibition of FLJ21865 (Accession NM_022759). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21865. FLJ23360 (Accession NM_023076) is another VGAM329 host target gene. FLJ23360 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ23360, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23360 BINDING SITE, designated SEQ ID:23335, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17311] Another function of VGAM329 is therefore inhibition of FLJ23360 (Accession NM_023076). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23360. Histidine Triad Nucleotide Binding Protein 3 (HINT3, Accession NM_138571) is another VGAM329 host target gene. HINT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HINT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HINT3 BINDING SITE, designated SEQ ID:28879, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17312] Another function of VGAM329 is therefore inhibition of Histidine Triad Nucleotide Binding Protein 3 (HINT3, Accession NM_138571). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HINT3. KIAA0630 (Accession XM_114729) is another VGAM329 host target gene. KIAA0630 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0630, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0630 BINDING SITE, designated SEQ ID:43064, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17313] Another function of VGAM329 is therefore inhibition of KIAA0630 (Accession XM_114729). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0630. KIAA0712 (Accession NM_014715) is another VGAM329 host target gene. KIAA0712 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0712, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0712 BINDING SITE, designated SEQ ID:16267, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17314] Another function of VGAM329 is therefore inhibition of KIAA0712 (Accession NM_014715). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0712. KIAA0855 (Accession NM_015003) is another VGAM329 host target gene. KIAA0855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0855 BINDING SITE, designated SEQ ID:17373, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17315] Another function of VGAM329 is therefore inhibition of KIAA0855 (Accession NM_015003). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0855. KIAA1001 (Accession NM_014960) is another VGAM329 host target gene. KIAA1001 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1001 BINDING SITE, designated SEQ ID:17329, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17316] Another function of VGAM329 is therefore inhibition of KIAA1001 (Accession NM_014960). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1001. KIAA1018 (Accession NM_014967) is another VGAM329 host target gene. KIAA1018 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1018 BINDING SITE, designated SEQ ID:17357, to the

nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17317] Another function of VGAM329 is therefore inhibition of KIAA1018 (Accession NM_014967). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1018. KIAA1884 (Accession XM_055539) is another VGAM329 host target gene. KIAA1884 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1884, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1884 BINDING SITE, designated SEQ ID:36298, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17318] Another function of VGAM329 is therefore inhibition of KIAA1884 (Accession XM_055539). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1884. MacGAP (Accession NM_033515) is another VGAM329 host target gene. MacGAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by MacGAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MacGAP BINDING SITE, designated SEQ ID:27292, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17319] Another function of VGAM329 is therefore inhibition of MacGAP (Accession NM_033515). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MacGAP. Phosphatidylinositol-4-phosphate 5-kinase, Type I, Gamma (PIP5K1C, Accession XM_047620) is another VGAM329 host target gene. PIP5K1C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIP5K1C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP5K1C BINDING SITE, designated SEQ ID:35018, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17320] Another function of VGAM329 is therefore inhibition of

Phosphatidylinositol-4-phosphate 5-kinase, Type I, Gamma (PIP5K1C, Accession XM_047620). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K1C. PRO1855 (Accession NM_018509) is another VGAM329 host target gene. PRO1855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO1855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1855 BINDING SITE, designated SEQ ID:20577, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17321] Another function of VGAM329 is therefore inhibition of PRO1855 (Accession NM_018509). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1855. RPH3A (Accession NM_014954) is another VGAM329 host target gene. RPH3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPH3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of RPH3A BINDING SITE, designated SEQ ID:17309, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17322] Another function of VGAM329 is therefore inhibition of RPH3A (Accession NM_014954). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPH3A. T-box 19 (TBX19, Accession NM_005149) is another VGAM329 host target gene. TBX19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TBX19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBX19 BINDING SITE, designated SEQ ID:11625, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17323] Another function of VGAM329 is therefore inhibition of T-box 19 (TBX19, Accession NM_005149). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

TBX19. Tripartite Motif-containing 4 (TRIM4, Accession NM_033017) is another VGAM329 host target gene. TRIM4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM4 BINDING SITE, designated SEQ ID:26905, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17324] Another function of VGAM329 is therefore inhibition of Tripartite Motif-containing 4 (TRIM4, Accession NM_033017). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM4. LOC116228 (Accession XM_057659) is another VGAM329 host target gene. LOC116228 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116228 BINDING SITE, designated SEQ ID:36536, to the nucleotide sequence of

VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17325] Another function of VGAM329 is therefore inhibition of LOC116228 (Accession XM_057659). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116228. LOC134145 (Accession XM_059691) is another VGAM329 host target gene. LOC134145 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC134145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC134145 BINDING SITE, designated SEQ ID:37061, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17326] Another function of VGAM329 is therefore inhibition of LOC134145 (Accession XM_059691). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134145. LOC145980 (Accession XM_096914) is another VGAM329 host target gene. LOC145980 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC145980, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145980 BINDING SITE, designated SEQ ID:40649, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17327] Another function of VGAM329 is therefore inhibition of LOC145980 (Accession XM_096914). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145980. LOC145988 (Accession XM_085290) is another VGAM329 host target gene. LOC145988 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145988 BINDING SITE, designated SEQ ID:38037, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17328] Another function of VGAM329 is therefore inhibition of LOC145988 (Accession XM_085290). Accordingly, utilities

of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145988. LOC146901 (Accession XM_097121) is another VGAM329 host target gene. LOC146901 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146901 BINDING SITE, designated SEQ ID:40763, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17329] Another function of VGAM329 is therefore inhibition of LOC146901 (Accession XM_097121). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146901. LOC150166 (Accession XM_097824) is another VGAM329 host target gene. LOC150166 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC150166 BINDING SITE, designated SEQ ID:41147, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17330] Another function of VGAM329 is therefore inhibition of LOC150166 (Accession XM_097824). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150166. LOC151429 (Accession XM_098059) is another VGAM329 host target gene. LOC151429 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151429 BINDING SITE, designated SEQ ID:41345, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17331] Another function of VGAM329 is therefore inhibition of LOC151429 (Accession XM_098059). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151429. LOC162333 (Accession XM_102591) is another VGAM329 host target gene. LOC162333 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC162333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:42142, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17332] Another function of VGAM329 is therefore inhibition of LOC162333 (Accession XM_102591). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162333. LOC199920 (Accession XM_114056) is another VGAM329 host target gene. LOC199920 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199920 BINDING SITE, designated SEQ ID:42660, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17333] Another function of VGAM329 is therefore inhibition of

LOC199920 (Accession XM_114056). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199920. LOC200734 (Accession XM_114286) is another VGAM329 host target gene. LOC200734 BINDING SITE1 and LOC200734 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC200734, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200734 BINDING SITE1 and LOC200734 BINDING SITE2, designated SEQ ID:42843 and SEQ ID:42844 respectively, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17334] Another function of VGAM329 is therefore inhibition of LOC200734 (Accession XM_114286). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200734. LOC51337 (Accession NM_016647) is another VGAM329 host target gene. LOC51337 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51337, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51337 BINDING SITE, designated SEQ ID:18764, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17335] Another function of VGAM329 is therefore inhibition of LOC51337 (Accession NM_016647). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51337. LOC83690 (Accession NM_031461) is another VGAM329 host target gene. LOC83690 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC83690, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC83690 BINDING SITE, designated SEQ ID:25486, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17336] Another function of VGAM329 is therefore inhibition of LOC83690 (Accession NM_031461). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC83690. LOC90917 (Accession XM_034861) is another VGAM329 host target gene. LOC90917 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90917, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90917 BINDING SITE, designated SEQ ID:32171, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17337] Another function of VGAM329 is therefore inhibition of LOC90917 (Accession XM_034861). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90917. LOC91149 (Accession XM_036480) is another VGAM329 host target gene. LOC91149 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91149, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91149 BINDING SITE, designated SEQ ID:32460, to the

nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17338] Another function of VGAM329 is therefore inhibition of LOC91149 (Accession XM_036480). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91149. LOC92568 (Accession XM_045852) is another VGAM329 host target gene. LOC92568 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92568, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92568 BINDING SITE, designated SEQ ID:34581, to the nucleotide sequence of VGAM329 RNA, herein designated VGAM RNA, also designated SEQ ID:3040.

[17339] Another function of VGAM329 is therefore inhibition of LOC92568 (Accession XM_045852). Accordingly, utilities of VGAM329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92568. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 330 (VGAM330) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17340] VGAM330 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM330 was detected is described hereinabove with reference to Figs. 1–8.

[17341] VGAM330 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 5. VGAM330 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17342] VGAM330 gene encodes a VGAM330 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM330

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM330 precursor RNA is designated SEQ ID:316, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:316 is located at position 43800 relative to the genome of Human Herpesvirus 5.

[17343] VGAM330 precursor RNA folds onto itself, forming VGAM330 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17344] An enzyme complex designated DICER COMPLEX, `dices` the VGAM330 folded precursor RNA into VGAM330 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 76%) nucleotide sequence of VGAM330 RNA is designated SEQ ID:3041, and is provided hereinbelow with reference to the sequence listing part.

[17345] VGAM330 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM330 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM330 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[17346] VGAM330 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM330 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM330 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM330 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM330 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17347] The complementary binding of VGAM330 RNA, herein designated VGAM RNA, to host target binding sites on VGAM330 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM330 host target RNA into VGAM330 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17348] It is appreciated that VGAM330 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM330 host target genes. The mRNA of each one of this plurality of VGAM330 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM330 RNA, herein designated VGAM RNA, and which when bound by VGAM330 RNA causes inhibition of translation of respective one or more VGAM330 host target proteins.

[17349] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM330 gene, herein designated VGAM GENE, on one or more VGAM330 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17350] It is yet further appreciated that a function of VGAM330 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 5. Specific functions, and accordingly utilities, of VGAM330 correlate with, and may be deduced from, the identity of the host target genes which VGAM330 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17351] Nucleotide sequences of the VGAM330 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM330 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM330 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM330 are further described hereinbelow with reference to Table 1.

[17352] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM330 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM330 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[17353] As mentioned hereinabove with reference to Fig. 1, a function of VGAM330 gene, herein designated VGAM is inhibition of expression of VGAM330 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM330 correlate with, and may be deduced from, the identity of the target genes which VGAM330 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17354] Cyclin D1 (PRAD1: parathyroid adenomatosis 1) (CCND1, Accession NM_053056) is a VGAM330 host target gene. CCND1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCND1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCND1 BINDING SITE, designated SEQ ID:27600, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17355] A function of VGAM330 is therefore inhibition of Cyclin D1 (PRAD1: parathyroid adenomatosis 1) (CCND1, Accession NM_053056), a gene which is involved in the control

of cell cycle and is required for Schwann cell proliferation to proceed normally during Wallerian degeneration. Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCND1. The function of CCND1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM220. Centromere Protein A, 17kDa (CENPA, Accession NM_001809) is another VGAM330 host target gene. CENPA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CENPA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENPA BINDING SITE, designated SEQ ID:7559, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17356] Another function of VGAM330 is therefore inhibition of Centromere Protein A, 17kDa (CENPA, Accession NM_001809), a gene which is a component of a modified nucleosome or nucleosome-like structure . Accordingly, utilities of VGAM330 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with CENPA. The function of CENPA has been established by previous studies. CENPA is a 17-kD centromere protein that was identified along with CENPB and CENPC (OMIM Ref. No. 117141) using centromere-specific autoantibodies from CREST (see OMIM Ref. No. 181750) patients. Palmer et al. (1991) purified CENPA protein from bull sperm nuclei and obtained a partial amino acid sequence. They found that some CENPA sequences are highly similar to regions of histone H3. Sullivan et al. (1994) cloned a bovine CENPA cDNA by RT-PCR using primers based on the bovine CENPA protein sequence. By screening a human endothelial cell cDNA library with the bovine cDNA, they isolated a human CENPA cDNA. The C-terminal region of the predicted 140-amino acid human protein shares 62% amino acid identity with that of histone H3.1. Epitope-tagged CENPA protein colocalized with centromeres when expressed in HeLa cells. The centromere-targeting signals of CENPA are located within the histone H3-homologous region. Sullivan et al. (1994) suggested that CENPA is a component of a modified nucleosome or nucleosome-like structure in which it replaces 1 or both copies of conventional histone H3 in the (H3-H4)₂

tetrameric core of the nucleosome particle. Animal model experiments lend further support to the function of CENPA. Using gene targeting, Howman et al. (2000) disrupted the mouse Cenpa gene and demonstrated that the gene is essential. Heterozygous mice were healthy and fertile, whereas null mutants failed to survive beyond 6.5 days postconception. Affected embryos showed severe mitotic problems, including micronuclei and macronuclei formation, nuclear bridging and blebbing, and chromatin fragmentation and hypercondensation. Immunofluorescence analysis of cells at day 5.5 revealed complete Cenpa depletion, diffuse Cenpb foci, absence of discrete Cenpc signal on centromeres, and dispersion of Cenpb and Cenpc throughout the nucleus. These results suggested that Cenpa is essential for kinetochore targeting of Cenpc and plays an early role in organizing centromeric chromatin at interphase. The evidence was consistent with the proposal of a critical epigenetic function for CENPA in marking a chromosomal region for centromere formation.

[17357] It is appreciated that the abovementioned animal model for CENPA is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[17358] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17359] Palmer, D. K.; O'Day, K.; Trong, H. L.; Charbonneau, H.; Margolis, R. L. : Purification of the centromere-specific protein CENP-A and demonstration that it is a distinctive histone. *Proc. Nat. Acad. Sci.* 88: 3734-3738, 1991. ; and

[17361] Further studies establishing the function and utilities of CENPA are found in John Hopkins OMIM database record ID 117139, and in cited publications numbered 4666-4670 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Dihydropyrimidine Dehydrogenase (DPYD, Accession XM_017469) is another VGAM330 host target gene. DPYD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DPYD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

DPYD BINDING SITE, designated SEQ ID:30316, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17362] Another function of VGAM330 is therefore inhibition of Dihydropyrimidine Dehydrogenase (DPYD, Accession XM_017469). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPYD. EGF-like-domain, Multiple 4 (EGFL4, Accession XM_029883) is another VGAM330 host target gene. EGFL4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EGFL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL4 BINDING SITE, designated SEQ ID:30968, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17363] Another function of VGAM330 is therefore inhibition of EGF-like-domain, Multiple 4 (EGFL4, Accession XM_029883). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL4. Homeo Box D4

(HOXD4, Accession NM_014621) is another VGAM330 host target gene. HOXD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HOXD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXD4 BINDING SITE, designated SEQ ID:15977, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17364] Another function of VGAM330 is therefore inhibition of Homeo Box D4 (HOXD4, Accession NM_014621), a gene which is part of a developmental regulatory system. Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXD4. The function of HOXD4 has been established by previous studies. See HOXD3 (OMIM Ref. No. 142980). The homologous mouse gene was at first designated a Hox-5 gene. HOX4 genes, other than the one subsequently designated HOX4A, were initially considered to be members of a different cluster of genes called HOX5. Oliver et al. (1989) found by study of interspecific somatic cell hybrids that the cluster of so-called

HOX5 genes map to human chromosome 2. By in situ hybridization, they found that the localization was 2q31–q32 with a peak of grains at 2q32.3. This gene is also called HOXD4, as a member of the HOXD gene cluster on 2q31. Mavilio et al. (1986) described the HOXD4 gene, but designated it homeo box X. Northern blot analysis detected multiple embryonic transcripts, which were differentially expressed in spinal cord, brain, backbone rudiments, limb buds, and heart in 5- to 9-week-old human embryos and fetuses in a striking organ- and stage-specific pattern. On the basis of these observations, Mavilio et al. (1986) suggested that in early mammalian development, homeo box genes may exert a wide spectrum of control functions in a variety of organs and body parts in addition to the spinal cord.

[17365] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17366] Mavilio, F.; Simeone, A.; Giampaolo, A.; Faiella, A.; Zapavigna, V.; Acampora, D.; Poiana, G.; Russo, G.; Peschle, C.; Boncinelli, E. : Differential and stage-related expression in embryonic tissues of a new human homoeobox gene. Nature 324: 664–668, 1986. ; and

[17367] Oliver, G.; Sidell, N.; Fiske, W.; Heinzmann, C.; Mohandas, T.; Sparkes, R. S.; De Robertis, E. M. : Complementary homeo protein gradients in developing limb buds. *Genes Dev.* 3: 641–650.

[17368] Further studies establishing the function and utilities of HOXD4 are found in John Hopkins OMIM database record ID 142981, and in cited publications numbered 3188–318 and 3187 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. WD Repeat Domain 1 (WDR1, Accession NM_017491) is another VGAM330 host target gene. WDR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WDR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WDR1 BINDING SITE, designated SEQ ID:18954, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17369] Another function of VGAM330 is therefore inhibition of WD Repeat Domain 1 (WDR1, Accession NM_017491). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions as–

sociated with WDR1. AFAP (Accession NM_021638) is another VGAM330 host target gene. AFAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AFAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AFAP BINDING SITE, designated SEQ ID:22290, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17370] Another function of VGAM330 is therefore inhibition of AFAP (Accession NM_021638). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AFAP. Rho Guanine Nucleotide Exchange Factor (GEF) 15 (ARHGEF15, Accession NM_014958) is another VGAM330 host target gene. ARHGEF15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGEF15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF15 BINDING SITE, designated SEQ ID:17315, to the nucleotide sequence of

VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17371] Another function of VGAM330 is therefore inhibition of Rho Guanine Nucleotide Exchange Factor (GEF) 15 (ARHGEF15, Accession NM_014958). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF15. Activating Transcription Factor 3 (ATF3, Accession NM_004024) is another VGAM330 host target gene. ATF3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATF3 BINDING SITE, designated SEQ ID:10241, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17372] Another function of VGAM330 is therefore inhibition of Activating Transcription Factor 3 (ATF3, Accession NM_004024). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATF3. FLJ12409 (Accession NM_025105) is another VGAM330 host target gene.

FLJ12409 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12409, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12409 BINDING SITE, designated SEQ ID:24752, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17373] Another function of VGAM330 is therefore inhibition of FLJ12409 (Accession NM_025105). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12409. FLJ12783 (Accession NM_031426) is another VGAM330 host target gene. FLJ12783 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12783, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12783 BINDING SITE, designated SEQ ID:25420, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17374] Another function of VGAM330 is therefore inhibition of FLJ12783 (Accession NM_031426). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12783. FLJ12910 (Accession NM_024573) is another VGAM330 host target gene. FLJ12910 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12910, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12910 BINDING SITE, designated SEQ ID:23800, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17375] Another function of VGAM330 is therefore inhibition of FLJ12910 (Accession NM_024573). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12910. FLJ14251 (Accession NM_024881) is another VGAM330 host target gene. FLJ14251 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14251 BINDING SITE, designated SEQ ID:24325, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17376] Another function of VGAM330 is therefore inhibition of FLJ14251 (Accession NM_024881). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14251. FLJ20315 (Accession NM_017763) is another VGAM330 host target gene. FLJ20315 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20315, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20315 BINDING SITE, designated SEQ ID:19380, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17377] Another function of VGAM330 is therefore inhibition of FLJ20315 (Accession NM_017763). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20315.

FLJ21162 (Accession NM_024873) is another VGAM330 host target gene. FLJ21162 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21162, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21162 BINDING SITE, designated SEQ ID:24307, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17378] Another function of VGAM330 is therefore inhibition of FLJ21162 (Accession NM_024873). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21162. FLJ23342 (Accession NM_024631) is another VGAM330 host target gene. FLJ23342 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23342 BINDING SITE, designated SEQ ID:23898, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3041.

[17379] Another function of VGAM330 is therefore inhibition of FLJ23342 (Accession NM_024631). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23342. HH114 (Accession NM_032499) is another VGAM330 host target gene. HH114 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HH114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HH114 BINDING SITE, designated SEQ ID:26251, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17380] Another function of VGAM330 is therefore inhibition of HH114 (Accession NM_032499). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HH114. KIAA0798 (Accession NM_014650) is another VGAM330 host target gene. KIAA0798 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0798, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0798 BINDING SITE, designated SEQ ID:16072, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17381] Another function of VGAM330 is therefore inhibition of KIAA0798 (Accession NM_014650). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0798. Mannosidase, Beta A, Lysosomal-like (MANBAL, Accession NM_022077) is another VGAM330 host target gene. MANBAL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MANBAL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MANBAL BINDING SITE, designated SEQ ID:22621, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17382] Another function of VGAM330 is therefore inhibition of Mannosidase, Beta A, Lysosomal-like (MANBAL, Accession

NM_022077). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MANBAL. Opiate Receptor-like 1 (OPRL1, Accession NM_000913) is another VGAM330 host target gene. OPRL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OPRL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPRL1 BINDING SITE, designated SEQ ID:6616, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17383] Another function of VGAM330 is therefore inhibition of Opiate Receptor-like 1 (OPRL1, Accession NM_000913). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPRL1. Solute Carrier Family 17 (sodium-dependent inorganic phosphate cotransporter), Member 6 (SLC17A6, Accession NM_020346) is another VGAM330 host target gene. SLC17A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC17A6, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC17A6 BINDING SITE, designated SEQ ID:21595, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17384] Another function of VGAM330 is therefore inhibition of Solute Carrier Family 17 (sodium-dependent inorganic phosphate cotransporter), Member 6 (SLC17A6, Accession NM_020346). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC17A6. LOC139221 (Accession XM_066558) is another VGAM330 host target gene. LOC139221 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC139221, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139221 BINDING SITE, designated SEQ ID:37331, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17385] Another function of VGAM330 is therefore inhibition of

LOC139221 (Accession XM_066558). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139221. LOC145844 (Accession XM_085255) is another VGAM330 host target gene. LOC145844 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145844, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145844 BINDING SITE, designated SEQ ID:37999, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17386] Another function of VGAM330 is therefore inhibition of LOC145844 (Accession XM_085255). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145844. LOC150290 (Accession XM_086863) is another VGAM330 host target gene. LOC150290 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150290, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC150290 BINDING SITE, designated SEQ ID:38933, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17387] Another function of VGAM330 is therefore inhibition of LOC150290 (Accession XM_086863). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150290. LOC164382 (Accession XM_104390) is another VGAM330 host target gene. LOC164382 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC164382, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164382 BINDING SITE, designated SEQ ID:42161, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17388] Another function of VGAM330 is therefore inhibition of LOC164382 (Accession XM_104390). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164382. LOC203350 (Accession XM_117536) is an-

other VGAM330 host target gene. LOC203350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203350 BINDING SITE, designated SEQ ID:43528, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17389] Another function of VGAM330 is therefore inhibition of LOC203350 (Accession XM_117536). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203350. LOC221362 (Accession XM_168093) is another VGAM330 host target gene. LOC221362 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221362, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221362 BINDING SITE, designated SEQ ID:45021, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17390] Another function of VGAM330 is therefore inhibition of LOC221362 (Accession XM_168093). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221362. LOC222060 (Accession XM_168427) is another VGAM330 host target gene. LOC222060 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222060, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222060 BINDING SITE, designated SEQ ID:45157, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17391] Another function of VGAM330 is therefore inhibition of LOC222060 (Accession XM_168427). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222060. LOC254413 (Accession XM_173141) is another VGAM330 host target gene. LOC254413 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254413, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254413 BINDING SITE, designated SEQ ID:46396, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17392] Another function of VGAM330 is therefore inhibition of LOC254413 (Accession XM_173141). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254413. LOC92573 (Accession XM_045884) is another VGAM330 host target gene. LOC92573 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92573, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92573 BINDING SITE, designated SEQ ID:34601, to the nucleotide sequence of VGAM330 RNA, herein designated VGAM RNA, also designated SEQ ID:3041.

[17393] Another function of VGAM330 is therefore inhibition of LOC92573 (Accession XM_045884). Accordingly, utilities of VGAM330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC92573. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 331 (VGAM331) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17394] VGAM331 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM331 was detected is described hereinabove with reference to Figs. 1–8.

[17395] VGAM331 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 5. VGAM331 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17396] VGAM331 gene encodes a VGAM331 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM331 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM331 precursor RNA is designated SEQ ID:317, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:317 is located at position 113291 relative to the genome of Human Herpesvirus 5.

[17397] VGAM331 precursor RNA folds onto itself, forming VGAM331 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17398] An enzyme complex designated DICER COMPLEX, `dices` the VGAM331 folded precursor RNA into VGAM331 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM331 RNA is designated SEQ ID:3042, and is provided hereinbelow with reference to the sequence listing part.

[17399] VGAM331 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM331 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM331 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17400] VGAM331 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM331 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM331 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM331 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM331 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17401] The complementary binding of VGAM331 RNA, herein designated VGAM RNA, to host target binding sites on VGAM331 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM331 host target RNA into VGAM331 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17402] It is appreciated that VGAM331 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM331 host target genes. The mRNA of each one of this plurality of VGAM331 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM331 RNA, herein designated VGAM RNA, and which when bound by VGAM331 RNA causes in-

hibition of translation of respective one or more VGAM331 host target proteins.

[17403] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM331 gene, herein designated VGAM GENE, on one or more VGAM331 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17404] It is yet further appreciated that a function of VGAM331 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM331 include diagnosis, prevention and

treatment of viral infection by Human Herpesvirus 5. Specific functions, and accordingly utilities, of VGAM331 correlate with, and may be deduced from, the identity of the host target genes which VGAM331 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17405] Nucleotide sequences of the VGAM331 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM331 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM331 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM331 are further described hereinbelow with reference to Table 1.

[17406] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM331 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM331 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17407] As mentioned hereinabove with reference to Fig. 1, a function of VGAM331 gene, herein designated VGAM is inhibition of expression of VGAM331 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM331 correlate with, and may be deduced from, the identity of the target genes which VGAM331 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17408] BTB and CNC Homology 1, Basic Leucine Zipper Transcription Factor 2 (BACH2, Accession NM_021813) is a VGAM331 host target gene. BACH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BACH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACH2 BINDING SITE, designated SEQ ID:22381, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17409] A function of VGAM331 is therefore inhibition of BTB and CNC Homology 1, Basic Leucine Zipper Transcription Factor 2 (BACH2, Accession NM_021813), a gene which acts as repressor or activator, binds to maf recognition elements. Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACH2. The function of BACH2 has

been established by previous studies. By screening a K562 erythroleukemia cell line with mouse Bach2 cDNA as the probe, Sasaki et al. (2000) isolated a cDNA encoding BACH2. The deduced 841-amino acid protein is 89.5% identical to mouse Bach2, with 97% identity shared in the BTB and bZip functional domains and 94% identity shared in the serine-rich region. Northern blot analysis revealed expression of an approximately 11.0-kb BACH2 transcript restricted to thymus, spleen, and leukocytes; low levels were also detected in small intestine and brain. Sasaki et al. (2000) found mRNA and protein expression primarily in B-lymphoid rather than other hematopoietic cell lines. RT-PCR analysis showed that BACH2, like mouse Bach2, is expressed in primary B cells at the progenitor, precursor, immature, and mature B-cell stages. Mouse Bach2 is not expressed in plasma cells (Muto et al., 1998). Gel shift analysis showed that when overexpressed, BACH2 binds to MAF recognition elements (MARE). Overexpression also resulted in a loss of clonogenic activity. Southern blot analysis determined that BACH2 is a single-copy gene. BACH2/CA-1 microsatellite analysis indicated that loss of heterozygosity occurred in 5 of 25 non-Hodgkin lymphoma (OMIM Ref. No. 605027) patients.

[17410] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17411] Sasaki, S.; Ito, E.; Toki, T.; Maekawa, T.; Kanezaki, R.; Umenai, T.; Muto, A.; Nagai, H.; Kinoshita, T.; Yamamoto, M.; Inazawa, J.; Taketo, M. M.; Nakahata, T.; Igarashi, K.; Yokoyama, M. : Cloning and expression of human B cell-specific transcription factor BACH2 mapped to chromosome 6q15. *Oncogene* 19: 3739–3749, 2000. ; and

[17412] Muto, A.; Hoshino, H.; Madisen, L.; Yanai, N.; Obinata, M.; Karasuyama, H.; Hayashi, N.; Nakauchi, H.; Yamamoto, M.; Groudine, M.; Igarashi, K. : Identification of Bach2 as a B-cell-spe.

[17413] Further studies establishing the function and utilities of BACH2 are found in John Hopkins OMIM database record ID 605394, and in cited publications numbered 731 and 7312 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Caspase 2, Apoptosis-related Cysteine Protease (neural precursor cell expressed, developmentally down-regulated 2) (CASP2, Accession NM_032982) is another VGAM331 host target gene. CASP2 BINDING SITE1 through CASP2 BINDING SITE4 are HOST TARGET binding sites found in untranslated re-

gions of mRNA encoded by CASP2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASP2 BINDING SITE1 through CASP2 BINDING SITE4, designated SEQ ID:26855, SEQ ID:26860, SEQ ID:26865 and SEQ ID:6892 respectively, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17414] Another function of VGAM331 is therefore inhibition of Caspase 2, Apoptosis-related Cysteine Protease (neural precursor cell expressed, developmentally down-regulated 2) (CASP2, Accession NM_032982), a gene which involves in the activation cascade of caspases responsible for apoptosis execution. Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP2. The function of CASP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM148.H3 Histone, Family 3B (H3.3B) (H3F3B, Accession NM_005324) is another VGAM331 host target gene. H3F3B BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by H3F3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H3F3B BINDING SITE, designated SEQ ID:11797, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17415] Another function of VGAM331 is therefore inhibition of H3 Histone, Family 3B (H3.3B) (H3F3B, Accession NM_005324). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H3F3B. Insulin-like Growth Factor 2 Receptor (IGF2R, Accession NM_000876) is another VGAM331 host target gene. IGF2R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IGF2R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IGF2R BINDING SITE, designated SEQ ID:6559, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17416] Another function of VGAM331 is therefore inhibition of Insulin-like Growth Factor 2 Receptor (IGF2R, Accession NM_000876), a gene which transport of phosphorylated lysosomal enzymes from the golgi complex and the cell surface to lysosomes. lysosomal enzymes bearing phosphomannosyl residues bind specifically to mannose-6-phosphate receptors in the golgi apparatus and the resulting receptor-ligand complex is transported to an acidic prelysosomal compartment where the low pH mediates the dissociation of the complex. this receptor also binds insulin growth factor ii. Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGF2R. The function of IGF2R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM209. Src Homology Three (SH3) and Cysteine Rich Domain (STAC, Accession NM_003149) is another VGAM331 host target gene. STAC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STAC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of STAC BINDING SITE, designated SEQ ID:9121, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17417] Another function of VGAM331 is therefore inhibition of Src Homology Three (SH3) and Cysteine Rich Domain (STAC, Accession NM_003149), a gene which is probably involved in a neuron-specific signal transduction. Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAC. The function of STAC has been established by previous studies. RLGS-M (restriction landmark genomic scanning using methylation-sensitive endonuclease) is a method for scanning the methylation status of large sections of a genome. Using RLGS-M to scan mouse brain genomic DNA from various developmental stages, Suzuki et al. (1996) found a tissue-specific gel spot whose intensity changed developmentally. The gene corresponding to this spot, which they termed Stac (for Src homology 3 and cysteine-rich domains), encodes a predicted 403-amino acid protein. The mouse Stac gene was used to clone human STAC from a fetal brain cDNA library. The predicted 402-amino acid STAC protein is 83% identical to

that of mouse. Suzuki et al. (1996) noted that cysteine-rich and SH3 domains are frequently found in signal transduction proteins, and suggested that STAC may play a role in the neuron-specific signal transduction pathway. Kawai et al. (1998) mapped the human STAC gene to 3p24-p22 using PCR of a radiation hybrid panel. The mouse Stac gene was mapped by interspecific backcross analysis to the distal portion of chromosome 9, in a region syntenic with human chromosome 3p21.

[17418] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17419] Kawai, J.; Suzuki, H.; Hara, A.; Hirose, K.; Watanabe, S. : Human and mouse chromosomal mapping of Stac, a neuron-specific protein with an SH3 domain. Genomics 47: 140-142, 1998. ; and

[17420] Suzuki, H.; Kawai, J.; Taga, C.; Yaoi, T.; Hara, A.; Hirose, K.; Hayashizaki, Y.; Watanabe, S. : Stac, a novel neuron-specific protein with cysteine-rich and SH3 domains. Biochem. Bioph.

[17421] Further studies establishing the function and utilities of STAC are found in John Hopkins OMIM database record ID 602317, and in cited publications numbered 6297-6298

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 264 (ZNF264, Accession NM_003417) is another VGAM331 host target gene. ZNF264 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF264, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF264 BINDING SITE, designated SEQ ID:9462, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17422] Another function of VGAM331 is therefore inhibition of Zinc Finger Protein 264 (ZNF264, Accession NM_003417). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF264. Butyrophilin, Subfamily 3, Member A1 (BTN3A1, Accession NM_007048) is another VGAM331 host target gene. BTN3A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BTN3A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTN3A1 BINDING SITE, designated SEQ ID:9463, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3043.

tarity of the nucleotide sequences of BTN3A1 BINDING SITE, designated SEQ ID:13922, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17423] Another function of VGAM331 is therefore inhibition of Butyrophilin, Subfamily 3, Member A1 (BTN3A1, Accession NM_007048). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN3A1. Chromosome 13 Open Reading Frame 1 (C13orf1, Accession NM_020456) is another VGAM331 host target gene. C13orf1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C13orf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C13orf1 BINDING SITE, designated SEQ ID:21694, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17424] Another function of VGAM331 is therefore inhibition of Chromosome 13 Open Reading Frame 1 (C13orf1, Accession NM_020456). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with C13orf1. Cyclin M1 (CNNM1, Accession NM_020348) is another VGAM331 host target gene. CNNM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNNM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM1 BINDING SITE, designated SEQ ID:21613, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17425] Another function of VGAM331 is therefore inhibition of Cyclin M1 (CNNM1, Accession NM_020348). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM1. FLJ12960 (Accession NM_024638) is another VGAM331 host target gene. FLJ12960 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12960 BINDING SITE, designated SEQ ID:23920, to the nucleotide

sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17426] Another function of VGAM331 is therefore inhibition of FLJ12960 (Accession NM_024638). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12960. FLJ20813 (Accession NM_017961) is another VGAM331 host target gene. FLJ20813 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20813 BINDING SITE, designated SEQ ID:19679, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17427] Another function of VGAM331 is therefore inhibition of FLJ20813 (Accession NM_017961). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20813. FLJ31101 (Accession NM_017964) is another VGAM331 host target gene. FLJ31101 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ31101, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31101 BINDING SITE, designated SEQ ID:19686, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17428] Another function of VGAM331 is therefore inhibition of FLJ31101 (Accession NM_017964). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31101. General Transcription Factor IIE, Polypeptide 1, Alpha 56kDa (GTF2E1, Accession NM_005513) is another VGAM331 host target gene. GTF2E1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GTF2E1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTF2E1 BINDING SITE, designated SEQ ID:12037, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17429] Another function of VGAM331 is therefore inhibition of

General Transcription Factor IIE, Polypeptide 1, Alpha 56kDa (GTF2E1, Accession NM_005513). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTF2E1. HSPC065 (Accession NM_014157) is another VGAM331 host target gene. HSPC065 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSPC065, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC065 BINDING SITE, designated SEQ ID:15455, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17430] Another function of VGAM331 is therefore inhibition of HSPC065 (Accession NM_014157). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC065. KIAA0450 (Accession NM_014638) is another VGAM331 host target gene. KIAA0450 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0450 BINDING SITE, designated SEQ ID:16037, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17431] Another function of VGAM331 is therefore inhibition of KIAA0450 (Accession NM_014638). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0450. KIAA1143 (Accession XM_044014) is another VGAM331 host target gene. KIAA1143 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1143 BINDING SITE, designated SEQ ID:34077, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17432] Another function of VGAM331 is therefore inhibition of KIAA1143 (Accession XM_044014). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1143. PRO0365 (Accession NM_014126) is another VGAM331 host target gene. PRO0365 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO0365, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0365 BINDING SITE, designated SEQ ID:15390, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17433] Another function of VGAM331 is therefore inhibition of PRO0365 (Accession NM_014126). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0365. RAB33B, Member RAS Oncogene Family (RAB33B, Accession NM_031296) is another VGAM331 host target gene. RAB33B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB33B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB33B BINDING SITE, designated SEQ ID:25332, to the nucleotide sequence of VGAM331 RNA,

herein designated VGAM RNA, also designated SEQ ID:3042.

[17434] Another function of VGAM331 is therefore inhibition of RAB33B, Member RAS Oncogene Family (RAB33B, Accession NM_031296). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB33B. TUCAN (Accession NM_014959) is another VGAM331 host target gene. TUCAN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TUCAN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUCAN BINDING SITE, designated SEQ ID:17319, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17435] Another function of VGAM331 is therefore inhibition of TUCAN (Accession NM_014959). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUCAN. LOC130535 (Accession XM_072244) is another VGAM331 host target gene. LOC130535 BINDING SITE is HOST TAR-

GET binding site found in the 3' untranslated region of mRNA encoded by LOC130535, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130535 BINDING SITE, designated SEQ ID:37478, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17436] Another function of VGAM331 is therefore inhibition of LOC130535 (Accession XM_072244). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130535. LOC143879 (Accession XM_084666) is another VGAM331 host target gene. LOC143879 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143879, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143879 BINDING SITE, designated SEQ ID:37660, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17437] Another function of VGAM331 is therefore inhibition of

LOC143879 (Accession XM_084666). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143879. LOC146854 (Accession XM_085618) is another VGAM331 host target gene. LOC146854 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146854 BINDING SITE, designated SEQ ID:38255, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17438] Another function of VGAM331 is therefore inhibition of LOC146854 (Accession XM_085618). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146854. LOC146909 (Accession XM_085634) is another VGAM331 host target gene. LOC146909 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146909, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC146909 BINDING SITE, designated SEQ ID:38269, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17439] Another function of VGAM331 is therefore inhibition of LOC146909 (Accession XM_085634). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146909. LOC169693 (Accession XM_108998) is another VGAM331 host target gene. LOC169693 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC169693, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169693 BINDING SITE, designated SEQ ID:42208, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17440] Another function of VGAM331 is therefore inhibition of LOC169693 (Accession XM_108998). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169693. LOC200014 (Accession XM_114087) is an-

other VGAM331 host target gene. LOC200014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200014 BINDING SITE, designated SEQ ID:42694, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17441] Another function of VGAM331 is therefore inhibition of LOC200014 (Accession XM_114087). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200014. LOC55893 (Accession NM_018660) is another VGAM331 host target gene. LOC55893 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC55893, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC55893 BINDING SITE, designated SEQ ID:20731, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17442] Another function of VGAM331 is therefore inhibition of LOC55893 (Accession NM_018660). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC55893. LOC89919 (Accession XM_027244) is another VGAM331 host target gene. LOC89919 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC89919, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89919 BINDING SITE, designated SEQ ID:30465, to the nucleotide sequence of VGAM331 RNA, herein designated VGAM RNA, also designated SEQ ID:3042.

[17443] Another function of VGAM331 is therefore inhibition of LOC89919 (Accession XM_027244). Accordingly, utilities of VGAM331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89919. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 332 (VGAM332) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[17444] VGAM332 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM332 was detected is described hereinabove with reference to Figs. 1–8.

[17445] VGAM332 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 3. VGAM332 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17446] VGAM332 gene encodes a VGAM332 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM332 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM332 precursor RNA is designated SEQ ID:318, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:318 is located at position 86054 relative to the genome of Human Herpesvirus 3.

[17447] VGAM332 precursor RNA folds onto itself, forming VGAM332 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional
`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[17448] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM332 folded precursor RNA into VGAM332 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 75%) nucleotide se-
quence of VGAM332 RNA is designated SEQ ID:3043, and
is provided hereinbelow with reference to the sequence
listing part.

[17449] VGAM332 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM332 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM332 host target RNA comprises
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17450] VGAM332 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM332 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM332 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM332 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM332 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17451] The complementary binding of VGAM332 RNA, herein designated VGAM RNA, to host target binding sites on VGAM332 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM332 host target RNA into VGAM332 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17452] It is appreciated that VGAM332 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM332 host target genes. The mRNA of each one of this plurality of VGAM332 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM332 RNA, herein designated VGAM RNA, and which when bound by VGAM332 RNA causes inhibition of translation of respective one or more VGAM332 host target proteins.

[17453] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM332 gene, herein designated VGAM GENE, on one or more VGAM332 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17454] It is yet further appreciated that a function of VGAM332 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM332 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM332 correlate with, and may be deduced from, the identity of the host target genes which VGAM332 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

- [17455] Nucleotide sequences of the VGAM332 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM332 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM332 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM332 are further described hereinbelow with reference to Table 1.
- [17456] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM332 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM332 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [17457] As mentioned hereinabove with reference to Fig. 1, a function of VGAM332 gene, herein designated VGAM is inhibition of expression of VGAM332 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM332 correlate with, and may be deduced from, the identity of the target genes which VGAM332 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17458] LOC56926 (Accession XM_052629) is a VGAM332 host target gene. LOC56926 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC56926, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56926 BINDING SITE, designated SEQ ID:36041, to the nucleotide sequence of VGAM332 RNA, herein designated VGAM RNA, also designated SEQ ID:3043.

[17459] A function of VGAM332 is therefore inhibition of LOC56926 (Accession XM_052629). Accordingly, utilities of VGAM332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56926. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 333 (VGAM333) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17460] VGAM333 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM333 was detected is described hereinabove with reference to Figs. 1–8.

[17461] VGAM333 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 3. VGAM333 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17462] VGAM333 gene encodes a VGAM333 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM333 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM333 precursor RNA is designated SEQ ID:319, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:319 is located at position 97703 relative to the genome of Human Herpesvirus 3.

[17463] VGAM333 precursor RNA folds onto itself, forming VGAM333 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17464] An enzyme complex designated DICER COMPLEX, `dices` the VGAM333 folded precursor RNA into VGAM333 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM333 RNA is designated SEQ ID:3044, and is provided hereinbelow with reference to the sequence listing part.

[17465] VGAM333 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM333 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM333 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17466] VGAM333 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM333 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM333 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM333 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM333 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[17467] The complementary binding of VGAM333 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM333 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM333 host target RNA into VGAM333 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17468] It is appreciated that VGAM333 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM333 host target genes. The mRNA of each one of this plurality of VGAM333 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM333 RNA, herein designated VGAM RNA, and which when bound by VGAM333 RNA causes inhibition of translation of respective one or more VGAM333 host target proteins.

[17469] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM333 gene, herein designated VGAM GENE, on one or more VGAM333 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17470] It is yet further appreciated that a function of VGAM333 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM333 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM333 correlate with, and may be deduced from, the identity of the host target genes which VGAM333 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17471] Nucleotide sequences of the VGAM333 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM333 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM333 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM333 are further described hereinbelow with reference to Table 1.

[17472] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM333 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM333 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17473] As mentioned hereinabove with reference to Fig. 1, a function of VGAM333 gene, herein designated VGAM is inhibition of expression of VGAM333 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM333 correlate with, and may be deduced from, the identity of the target genes which VGAM333 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17474] GR6 (Accession NM_007354) is a VGAM333 host target gene. GR6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GR6, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GR6 BINDING SITE, designated SEQ ID:14278, to the nucleotide sequence of VGAM333 RNA, herein designated VGAM RNA, also designated SEQ ID:3044.

[17475] A function of VGAM333 is therefore inhibition of GR6 (Accession NM_007354). Accordingly, utilities of VGAM333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GR6. Interleukin Enhancer Binding Factor 3, 90kDa (ILF3, Accession NM_004516) is another VGAM333 host target gene. ILF3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ILF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ILF3 BINDING SITE, designated SEQ ID:10845, to the nucleotide sequence of VGAM333 RNA, herein designated VGAM RNA, also designated SEQ ID:3044.

[17476] Another function of VGAM333 is therefore inhibition of Interleukin Enhancer Binding Factor 3, 90kDa (ILF3, Accession NM_004516). Accordingly, utilities of VGAM333 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with ILF3. KIAA1841 (Accession XM_087056) is another VGAM333 host target gene. KIAA1841 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1841 BINDING SITE, designated SEQ ID:39027, to the nucleotide sequence of VGAM333 RNA, herein designated VGAM RNA, also designated SEQ ID:3044.

[17477] Another function of VGAM333 is therefore inhibition of KIAA1841 (Accession XM_087056). Accordingly, utilities of VGAM333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1841. pcnp (Accession NM_020357) is another VGAM333 host target gene. pcnp BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by pcnp, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of pcnp BINDING SITE, designated SEQ ID:21625, to the nucleotide sequence of

VGAM333 RNA, herein designated VGAM RNA, also designated SEQ ID:3044.

[17478] Another function of VGAM333 is therefore inhibition of pcnp (Accession NM_020357). Accordingly, utilities of VGAM333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with pcnp. Wingless-type MMTV Integration Site Family, Member 16 (WNT16, Accession NM_057168) is another VGAM333 host target gene. WNT16 BINDING SITE1 and WNT16 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WNT16, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT16 BINDING SITE1 and WNT16 BINDING SITE2, designated SEQ ID:27673 and SEQ ID:18169 respectively, to the nucleotide sequence of VGAM333 RNA, herein designated VGAM RNA, also designated SEQ ID:3044.

[17479] Another function of VGAM333 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 16 (WNT16, Accession NM_057168). Accordingly, utilities of VGAM333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT16.

LOC139770 (Accession XM_060053) is another VGAM333 host target gene. LOC139770 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC139770, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139770 BINDING SITE, designated SEQ ID:37147, to the nucleotide sequence of VGAM333 RNA, herein designated VGAM RNA, also designated SEQ ID:3044.

[17480] Another function of VGAM333 is therefore inhibition of LOC139770 (Accession XM_060053). Accordingly, utilities of VGAM333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139770. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 334 (VGAM334) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17481] VGAM334 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM334 was detected is described hereinabove with reference to Figs. 1–8.

[17482] VGAM334 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 3. VGAM334 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17483] VGAM334 gene encodes a VGAM334 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM334 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM334 precursor RNA is designated SEQ ID:320, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:320 is located at position 97885 relative to the genome of Human Herpesvirus 3.

[17484] VGAM334 precursor RNA folds onto itself, forming VGAM334 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17485] An enzyme complex designated DICER COMPLEX, `dices` the VGAM334 folded precursor RNA into VGAM334 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM334 RNA is designated SEQ ID:3045, and is provided hereinbelow with reference to the sequence listing part.

[17486] VGAM334 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM334 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM334 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17487] VGAM334 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM334 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM334 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM334 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM334 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[17488] The complementary binding of VGAM334 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM334 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM334 host target RNA into VGAM334 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17489] It is appreciated that VGAM334 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM334 host target genes. The mRNA of each one of this plurality of VGAM334 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM334 RNA, herein designated VGAM RNA, and which when bound by VGAM334 RNA causes inhibition of translation of respective one or more VGAM334 host target proteins.

[17490] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM334 gene, herein designated VGAM GENE, on one or more VGAM334 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17491] It is yet further appreciated that a function of VGAM334 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM334 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM334 correlate with, and may be deduced from, the identity of the host target genes which VGAM334 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17492] Nucleotide sequences of the VGAM334 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM334 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM334 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM334 are further described hereinbelow with reference to Table 1.

[17493] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM334 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM334 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17494] As mentioned hereinabove with reference to Fig. 1, a function of VGAM334 gene, herein designated VGAM is inhibition of expression of VGAM334 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM334 correlate with, and may be deduced from, the identity of the target genes which VGAM334 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17495] ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM_036933) is a VGAM334 host target gene. ATP8B2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP8B2, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP8B2 BINDING SITE, designated SEQ ID:32518, to the nucleotide sequence of VGAM334 RNA, herein designated VGAM RNA, also designated SEQ ID:3045.

[17496] A function of VGAM334 is therefore inhibition of ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM_036933). Accordingly, utilities of VGAM334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8B2. Very Low Density Lipoprotein Receptor (VLDLR, Accession XM_045386) is another VGAM334 host target gene. VLDLR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VLDLR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VLDLR BINDING SITE, designated SEQ ID:34449, to the nucleotide sequence of VGAM334 RNA, herein designated VGAM RNA, also designated SEQ ID:3045.

[17497] Another function of VGAM334 is therefore inhibition of Very Low Density Lipoprotein Receptor (VLDLR, Accession

XM_045386), a gene which may play a crucial role in triglyceride metabolism. Accordingly, utilities of VGAM334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VLDLR. The function of VLDLR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM103. KIAA1026 (Accession XM_048825) is another VGAM334 host target gene. KIAA1026 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1026 BINDING SITE, designated SEQ ID:35273, to the nucleotide sequence of VGAM334 RNA, herein designated VGAM RNA, also designated SEQ ID:3045.

[17498] Another function of VGAM334 is therefore inhibition of KIAA1026 (Accession XM_048825). Accordingly, utilities of VGAM334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1026. LOC135818 (Accession XM_059804) is another VGAM334 host target gene. LOC135818 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC135818, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135818 BINDING SITE, designated SEQ ID:37094, to the nucleotide sequence of VGAM334 RNA, herein designated VGAM RNA, also designated SEQ ID:3045.

[17499] Another function of VGAM334 is therefore inhibition of LOC135818 (Accession XM_059804). Accordingly, utilities of VGAM334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135818. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 335 (VGAM335) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17500] VGAM335 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM335 was detected is described hereinabove with reference to Figs. 1-8.

[17501] VGAM335 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM335 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17502] VGAM335 gene encodes a VGAM335 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM335 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM335 precursor RNA is designated SEQ ID:321, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:321 is located at position 23128 relative to the genome of Saimiriine Herpesvirus 2.

[17503] VGAM335 precursor RNA folds onto itself, forming VGAM335 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[17504] An enzyme complex designated DICER COMPLEX, `dices` the VGAM335 folded precursor RNA into VGAM335 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM335 RNA is designated SEQ ID:3046, and is provided hereinbelow with reference to the sequence listing part.

[17505] VGAM335 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM335 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM335 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17506] VGAM335 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM335 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM335 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM335 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM335 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17507] The complementary binding of VGAM335 RNA, herein designated VGAM RNA, to host target binding sites on VGAM335 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM335 host target RNA into VGAM335 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17508] It is appreciated that VGAM335 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM335 host target genes. The mRNA of each one of this plurality of VGAM335 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM335 RNA, herein designated VGAM RNA, and which when bound by VGAM335 RNA causes inhibition of translation of respective one or more VGAM335 host target proteins.

[17509] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM335 gene, herein designated VGAM GENE, on one or more VGAM335 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17510] It is yet further appreciated that a function of VGAM335 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM335 correlate with, and may be deduced from, the identity of the host target genes which VGAM335 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17511] Nucleotide sequences of the VGAM335 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM335 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM335 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM335 are further described hereinbelow with reference to Table 1.

[17512] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM335 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM335 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17513] As mentioned hereinabove with reference to Fig. 1, a function of VGAM335 gene, herein designated VGAM is inhibition of expression of VGAM335 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM335 correlate with, and may be deduced from, the identity of the target genes which VGAM335 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17514] Cytochrome P450, Subfamily I (aromatic compound-inducible), Polypeptide 1 (CYP1A1, Accession NM_000499) is a VGAM335 host target gene. CYP1A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP1A1 BINDING SITE, designated SEQ ID:6114, to the nucleotide sequence of VGAM335 RNA, herein designated VGAM RNA, also designated SEQ ID:3046.

[17515] A function of VGAM335 is therefore inhibition of Cytochrome P450, Subfamily I (aromatic compound-inducible), Polypeptide 1 (CYP1A1, Accession NM_000499), a gene which intervenes in an NADPH-dependent electron transport pathway. Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP1A1. The function of CYP1A1 has been established by previous studies. Polycyclic aromatic hydrocarbons (PAHs) generated from the combustion of fossil fuels, and aromatic amines, which are present in cigarette smoke and other environmental media, present 2 classic environmental carcinogens. Perera (1997) reviewed evidence on variation and susceptibility to the effects of these carcinogens. CYP1A1 encodes a phase I cytochrome P450 enzyme that metabolizes PAHs such as benzo[a]pyrene (BP). About 10% of Caucasians have a highly inducible form of the enzyme that is associated with an increased risk of lung cancer in

smokers. Although not all studies have been positive, in Japanese and certain Caucasian populations, increased lung cancer risk was correlated with 1 or both CYP1A1 polymorphisms: the so called MSPI polymorphism and the closely-linked exon 7 (isoleucine-valine) polymorphism (Kawajiri et al., 1996; Nakachi et al., 1991; Xu et al., 1996). The greatest incremental lung cancer risk from the 'susceptible' CYP1A1 genotype was seen in light smokers (7 times the risk of light smokers without the genotype), whereas heavy smokers with this genotype had less than twice the risk of heavy smokers without the genotype. The proposed mechanism for the increased risk is higher CYP1A1 inducibility or enhanced catalytic activity of the valine-type CYP1A1 enzyme. Consistent with these mechanisms, Mooney et al. (1997) found that U. S. smoking volunteers with the exon 7 mutation had more PAH-DNA adducts in their white blood cells than did smokers without the variant. Perera (1997) stated that PAH-DNA adducts were also elevated in cord blood and placenta of newborns with the CYP1A1 MSP1 polymorphism, which suggested that the genetic polymorphism may increase risk from transplacental PAH exposure. In lung tissue of adults, adduct concentration correlated with CYP1A1 ex-

pression or enzyme activity. Perera (1997) noted that lung tumors of Japanese smokers were found to be significantly more likely to have p53 (OMIM Ref. No. 191170) mutations if they had the susceptible CYP1A1 genotype. A failure to demonstrate genetic susceptibility through CYP1A1 polymorphism when exposure to the environmental carcinogen is heavy is observed with some other polymorphisms and carcinogenic exposures. It is possible that at higher exposures, the effects of the genetic traits are overwhelmed by the environmental insults. Numerous studies have shown that maternal cigarette smoking during pregnancy is associated with reduced birthweight and increased risk of low birthweight, defined as weight less than 2,500 g. Maternal cigarette smoking has thus been identified as the single largest modifiable risk factor for intrauterine growth restriction in developed countries. However, not all women who smoke cigarettes during pregnancy have low-birthweight infants. Wang et al. (2002) studied whether the association between maternal cigarette smoking and infant birthweight differs by polymorphisms of 2 maternal metabolic genes: CYP1A1 and GSTT1 (OMIM Ref. No. 600436). The CYP1A1 polymorphism was the Msp1 polymorphism (AA vs Aa and aa); the

GSTT1 polymorphism was present versus absent. Wang et al. (2002) found that regardless of genotype, continuous maternal smoking during pregnancy was associated with a mean reduction of 377 g in birthweight. They found that for the CYP1A1 genotype, the estimated reduction in birthweight was 252 g for the AA genotype group, but was 520 g for the Aa/aa genotype group. For the GSTT1 genotype, they found the estimated reduction in birthweight was 285 g and 642 g for the present and absent genotype groups, respectively. When both CYP1A1 and GSTT1 genotypes were considered, Wang et al. (2002) found the greatest reduction in birthweight among smoking mothers with the CYP1A1 Aa/aa and GSTT1 absent genotypes. Among mothers who had not smoked during their pregnancy or during the 3 months prior to their pregnancy, genotype did not independently confer an adverse effect. Animal model experiments lend further support to the function of CYP1A1. Thum and Borlak (2000) investigated the gene expression of major human cytochrome P450 genes in various regions of explanted hearts from 6 patients with dilated cardiomyopathy and 1 with transposition of the arterial trunk and 2 samples of normal heart. mRNA for cytochrome 1A1 was predomi-

nantly expressed in the right ventricle. A strong correlation between tissue-specific gene expression and enzyme activity was found. Thum and Borlak (2000) concluded that their findings showed that expression of genes for cytochrome P450 monooxygenases and verapamil metabolism are found predominantly in the right side of the heart, and suggested that this observation may explain the lack of efficacy of certain cardioselective drugs.

[17516] It is appreciated that the abovementioned animal model for CYP1A1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[17517] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17518] Corchero, J.; Pimprale, S.; Kimura, S.; Gonzalez, F. J. : Organization of the CYP1A cluster on human chromosome 15: implications for gene regulation. Pharmacogenetics 11: 1-6, 2001. ; and

[17519] Petersen, D. D.; McKinney, C. E.; Ikeya, K.; Smith, H. H.; Bale, A. E.; McBride, O. W.; Nebert, D. W. : Human CYP1A1 gene: cosegregation of the enzyme inducibility phenotype and an RFL.

[17520] Further studies establishing the function and utilities of CYP1A1 are found in John Hopkins OMIM database record ID 108330, and in cited publications numbered 12082–12087, 788, 848–852, 11777–861, 12760, 12761–86 and 3429–869 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Phosphatase 2, Regulatory Subunit B (B56), Gamma Isoform (PPP2R5C, Accession NM_002719) is another VGAM335 host target gene. PPP2R5C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP2R5C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2R5C BINDING SITE, designated SEQ ID:8588, to the nucleotide sequence of VGAM335 RNA, herein designated VGAM RNA, also designated SEQ ID:3046.

[17521] Another function of VGAM335 is therefore inhibition of Protein Phosphatase 2, Regulatory Subunit B (B56), Gamma Isoform (PPP2R5C, Accession NM_002719), a gene which is a regulatory subunit of protein phosphatase 2A. Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with PPP2R5C. The function of PPP2R5C has been established by previous studies. Protein phosphorylation is a regulatory mechanism commonly employed in cellular processes such as cell cycle progression, growth factor signaling, and cell transformation. Protein phosphatase 2A (PP2A), a heterotrimeric serine/threonine phosphatase, has been implicated in a variety of regulatory processes including cell growth and division, muscle contraction, and gene transcription. PP2A is a trimeric enzyme composed of a catalytic subunit (OMIM Ref. No. 176915), a structural subunit, and any of several different regulatory subunits which control its specificity. One family of related PP2A regulatory subunits is designated the B56 family and contains at least 5 different members (McCright and Virshup (1995)). The alpha (OMIM Ref. No. 601643) and gamma subunits are expressed at highest levels in skeletal and cardiac muscle. Both the delta (OMIM Ref. No. 601646) and gamma subunits encode nuclear phosphoproteins and at least 3 splice variants of the gamma subunit have been reported. The longest gamma isoform is a phosphoprotein, but the shortest is not.

[17522] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [17523] McCright, B.; Brothman, A. R.; Virshup, D. M. : Assignment of human protein phosphatase 2A regulatory subunit genes B56-alpha, B56-beta, B56-gamma, B56-delta, and B56-epsilon (PPP2R5A--PPP2R5E), highly expressed in muscle and brain, to chromosome regions 1q41, 11q12, 3p21, 6p21.1, and 7p11.2-to-p12. Genomics 36: 168-170, 1996. ; and

- [17525] Further studies establishing the function and utilities of PPP2R5C are found in John Hopkins OMIM database record ID 601645, and in cited publications numbered 6687-668 and 6554 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ALDH9 (Accession NM_000696) is another VGAM335 host target gene. ALDH9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALDH9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALDH9 BINDING SITE, designated SEQ

ID:6360, to the nucleotide sequence of VGAM335 RNA, herein designated VGAM RNA, also designated SEQ ID:3046.

[17526] Another function of VGAM335 is therefore inhibition of ALDH9 (Accession NM_000696). Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH9. Basic Helix-loop-helix Domain Containing, Class B, 2 (BHLHB2, Accession NM_003670) is another VGAM335 host target gene. BHLHB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BHLHB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BHLHB2 BINDING SITE, designated SEQ ID:9753, to the nucleotide sequence of VGAM335 RNA, herein designated VGAM RNA, also designated SEQ ID:3046.

[17527] Another function of VGAM335 is therefore inhibition of Basic Helix-loop-helix Domain Containing, Class B, 2 (BHLHB2, Accession NM_003670). Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BHLHB2.

Chromosome 21 Open Reading Frame 41 (C21orf41, Accession NM_138332) is another VGAM335 host target gene. C21orf41 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C21orf41, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf41 BINDING SITE, designated SEQ ID:28732, to the nucleotide sequence of VGAM335 RNA, herein designated VGAM RNA, also designated SEQ ID:3046.

[17528] Another function of VGAM335 is therefore inhibition of Chromosome 21 Open Reading Frame 41 (C21orf41, Accession NM_138332). Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf41. DKFZP564D206 (Accession XM_166501) is another VGAM335 host target gene. DKFZP564D206 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564D206, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DK-

FZP564D206 BINDING SITE, designated SEQ ID:44428, to the nucleotide sequence of VGAM335 RNA, herein designated VGAM RNA, also designated SEQ ID:3046.

[17529] Another function of VGAM335 is therefore inhibition of DKFZP564D206 (Accession XM_166501). Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D206. DKFZP761D0211 (Accession NM_032039) is another VGAM335 host target gene. DKFZP761D0211 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP761D0211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP761D0211 BINDING SITE, designated SEQ ID:25737, to the nucleotide sequence of VGAM335 RNA, herein designated VGAM RNA, also designated SEQ ID:3046.

[17530] Another function of VGAM335 is therefore inhibition of DKFZP761D0211 (Accession NM_032039). Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761D0211. FLJ12649 (Accession NM_024597)

is another VGAM335 host target gene. FLJ12649 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12649, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12649 BINDING SITE, designated SEQ ID:23834, to the nucleotide sequence of VGAM335 RNA, herein designated VGAM RNA, also designated SEQ ID:3046.

[17531] Another function of VGAM335 is therefore inhibition of FLJ12649 (Accession NM_024597). Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12649. FLJ13441 (Accession NM_023924) is another VGAM335 host target gene. FLJ13441 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13441 BINDING SITE, designated SEQ ID:23399, to the nucleotide sequence of VGAM335 RNA, herein designated VGAM RNA, also designated SEQ ID:3046.

[17532] Another function of VGAM335 is therefore inhibition of FLJ13441 (Accession NM_023924). Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13441. MGC2306 (Accession NM_032638) is another VGAM335 host target gene. MGC2306 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2306, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2306 BINDING SITE, designated SEQ ID:26357, to the nucleotide sequence of VGAM335 RNA, herein designated VGAM RNA, also designated SEQ ID:3046.

[17533] Another function of VGAM335 is therefore inhibition of MGC2306 (Accession NM_032638). Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2306. MGC26684 (Accession NM_144568) is another VGAM335 host target gene. MGC26684 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC26684, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC26684 BINDING SITE, designated SEQ ID:29372, to the nucleotide sequence of VGAM335 RNA, herein designated VGAM RNA, also designated SEQ ID:3046.

[17534] Another function of VGAM335 is therefore inhibition of MGC26684 (Accession NM_144568). Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC26684. SCYA28 (Accession NM_019846) is another VGAM335 host target gene. SCYA28 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCYA28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYA28 BINDING SITE, designated SEQ ID:21250, to the nucleotide sequence of VGAM335 RNA, herein designated VGAM RNA, also designated SEQ ID:3046.

[17535] Another function of VGAM335 is therefore inhibition of SCYA28 (Accession NM_019846). Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYA28.

LOC152627 (Accession XM_087495) is another VGAM335 host target gene. LOC152627 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152627 BINDING SITE, designated SEQ ID:39298, to the nucleotide sequence of VGAM335 RNA, herein designated VGAM RNA, also designated SEQ ID:3046.

[17536] Another function of VGAM335 is therefore inhibition of LOC152627 (Accession XM_087495). Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152627. LOC153937 (Accession XM_087813) is another VGAM335 host target gene. LOC153937 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153937 BINDING SITE, designated SEQ ID:39448, to the nucleotide sequence of VGAM335 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3046.

[17537] Another function of VGAM335 is therefore inhibition of LOC153937 (Accession XM_087813). Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153937. LOC200609 (Accession XM_117256) is another VGAM335 host target gene. LOC200609 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200609 BINDING SITE, designated SEQ ID:43335, to the nucleotide sequence of VGAM335 RNA, herein designated VGAM RNA, also designated SEQ ID:3046.

[17538] Another function of VGAM335 is therefore inhibition of LOC200609 (Accession XM_117256). Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200609. LOC92249 (Accession XM_043814) is another VGAM335 host target gene. LOC92249 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92249, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92249 BINDING SITE, designated SEQ ID:34025, to the nucleotide sequence of VGAM335 RNA, herein designated VGAM RNA, also designated SEQ ID:3046.

[17539] Another function of VGAM335 is therefore inhibition of LOC92249 (Accession XM_043814). Accordingly, utilities of VGAM335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92249. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 336 (VGAM336) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17540] VGAM336 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM336 was detected is described hereinabove with reference to Figs. 1–8.

[17541] VGAM336 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2.

VGAM336 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17542] VGAM336 gene encodes a VGAM336 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM336 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM336 precursor RNA is designated SEQ ID:322, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:322 is located at position 23007 relative to the genome of Saimiriine Herpesvirus 2.

[17543] VGAM336 precursor RNA folds onto itself, forming VGAM336 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17544] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM336 folded precursor RNA into VGAM336 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM336 RNA is designated SEQ ID:3047, and is provided hereinbelow with reference to the sequence listing part.

[17545] VGAM336 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM336 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM336 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17546] VGAM336 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM336 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM336 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM336 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM336 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17547] The complementary binding of VGAM336 RNA, herein designated VGAM RNA, to host target binding sites on VGAM336 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM336 host target RNA into VGAM336 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17548] It is appreciated that VGAM336 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM336 host target genes. The mRNA of each one of this plurality of VGAM336 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM336 RNA, herein designated VGAM RNA, and which when bound by VGAM336 RNA causes inhibition of translation of respective one or more VGAM336 host target proteins.

[17549] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM336 gene, herein designated VGAM GENE, on one or more VGAM336 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17550] It is yet further appreciated that a function of VGAM336 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM336 correlate with, and may be deduced from, the identity of the host target genes which VGAM336 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17551] Nucleotide sequences of the VGAM336 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM336 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM336 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM336 are further described hereinbelow with reference to Table 1.

[17552] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM336 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM336 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17553] As mentioned hereinabove with reference to Fig. 1, a function of VGAM336 gene, herein designated VGAM is inhibition of expression of VGAM336 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM336 correlate with, and may be deduced from, the identity of the target genes which VGAM336 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17554] ATP-binding Cassette, Sub-family A (ABC1), Member 3 (ABCA3, Accession NM_001089) is a VGAM336 host target gene. ABCA3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ABCA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCA3 BINDING SITE, designated SEQ

ID:6745, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17555] A function of VGAM336 is therefore inhibition of ATP-binding Cassette, Sub-family A (ABC1), Member 3 (ABCA3, Accession NM_001089), a gene which may be a transporter, may act as an efflux pump for chemotherapeutics drugs. Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA3. The function of ABCA3 has been established by previous studies. Klugbauer and Hofmann (1996) isolated cDNA clones encoding a novel protein they designated ABC-C from a human medullary thyroid cancer cell line. ABC-C has typical structural features of the ABC transporter family (see OMIM Ref. No. 600046). They determined that the transporter consists of a 1,704-amino acid polypeptide with 2 homologous repeats, each harboring 6 putative transmembrane helices and an ATP-binding cassette motif. The ABC-C protein showed approximately 50% homology with the MRP1 (OMIM Ref. No. 158343) protein. Klugbauer and Hofmann (1996) mapped the ABC-C gene (also symbolized ABC3) to chromosome 16p13.3 by comparison with an identical

cDNA clone mapping to that chromosomal region. They noted that the ABC-C gene and the gene encoding MRP1 map within the same chromosomal band. Wu and Horvitz (1998) found that the *C. elegans* protein ced-7 is homologous to human ABC3. Ced-7 functions in the engulfment of cell corpses during programmed cell death, is broadly expressed during embryogenesis, and is localized to the plasma membrane. Mosaic analysis revealed that ced-7 functions in both dying cells and engulfing cells during the engulfment process. Wu and Horvitz (1998) proposed that ced-7 functions to translocate molecules that mediate homotypic adhesion between the cell surfaces of the dying and engulfing cells. They also suggested that ABC3 may be functionally similar and that the molecular mechanism underlying cell corpse engulfment during programmed cell death may be conserved from nematodes to mammals.

[17556] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17557] Klugbauer, N.; Hofmann, F. : Primary structure of a novel ABC transporter with a chromosomal localization on the band encoding the multidrug resistance-associated pro-

tein. FEBS Lett. 391: 61–65, 1996. ; and

[17558] Wu, Y.-C.; Horvitz, H. R. : The C. elegans cell corpse engulfment gene ced-7 encodes a protein similar to ABC transporters. Cell 93: 951–960, 1998.

[17559] Further studies establishing the function and utilities of ABCA3 are found in John Hopkins OMIM database record ID 601615, and in cited publications numbered 1246–1248 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Brain and Acute Leukemia, Cytoplasmic (BAALC, Accession NM_024812) is another VGAM336 host target gene. BAALC BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BAALC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAALC BINDING SITE, designated SEQ ID:24193, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17560] Another function of VGAM336 is therefore inhibition of Brain and Acute Leukemia, Cytoplasmic (BAALC, Accession NM_024812). Accordingly, utilities of VGAM336 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with BAALC. Coagulation Factor VII (serum prothrombin conversion accelerator) (F7, Accession NM_000131) is another VGAM336 host target gene. F7 BINDING SITE1 and F7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by F7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F7 BINDING SITE1 and F7 BINDING SITE2, designated SEQ ID:5609 and SEQ ID:21238 respectively, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17561] Another function of VGAM336 is therefore inhibition of Coagulation Factor VII (serum prothrombin conversion accelerator) (F7, Accession NM_000131). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F7. Lymphoid Enhancer-binding Factor 1 (LEF1, Accession NM_016269) is another VGAM336 host target gene. LEF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LEF1, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEF1 BINDING SITE, designated SEQ ID:18390, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17562] Another function of VGAM336 is therefore inhibition of Lymphoid Enhancer-binding Factor 1 (LEF1, Accession NM_016269), a gene which plays an essential role in the formation of several organs and structures that require inductive tissue interactions. Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEF1. The function of LEF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. Nuclear Receptor Subfamily 1, Group I, Member 2 (NR1I2, Accession NM_003889) is another VGAM336 host target gene. NR1I2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NR1I2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of NR1I2 BINDING SITE, designated SEQ ID:9971, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17563] Another function of VGAM336 is therefore inhibition of Nuclear Receptor Subfamily 1, Group I, Member 2 (NR1I2, Accession NM_003889), a gene which binds to a response element in the cyp3a4 gene promoter and activates its expression in response to a wide variety of endobiotics and xenobiotics. Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR1I2. The function of NR1I2 has been established by previous studies. Lehmann et al. (1998) identified a nuclear receptor, termed PXR, that binds to the rifampicin/dexamethasone response element in the CYP3A4 (OMIM Ref. No. 124010) promoter as a heterodimer with the 9-cis retinoic acid receptor RXR (see OMIM Ref. No. 180245). The human PXR is related to the mouse Pxr1, which they had cloned and shown to be activated by dexamethasone, pregnenolone 16- α -carbonitrile (PCN), and other compounds known to induce expression of the CYP3A1 gene, the predominant form of CYP3A in rat liver and intestine. Lehmann et

al. (1998) isolated PXR clones from a human liver cDNA library. Amino acid sequence comparison showed that human PXR shared 96% and 76% sequence identity with mouse Pxr1 in the DNA-binding and ligand-binding domains, respectively. Initiation of translation at a CUG initiation codon would yield a protein of 434 amino acids. Northern blot analysis detected most abundant expression in liver, colon, and small intestine; transcripts of 2.6, 4.3, and 5 kb were present in each of these tissues. Lehmann et al. (1998) provided several lines of evidence indicating that human PXR serves as a key transcriptional regulator of the CYP3A4 gene. Animal model experiments lend further support to the function of NR1I2. The induction of CYP3A enzymes is species-specific and believed to involve 1 or more cellular factors, or receptor-like xenosensors. Xie et al. (2000) identified one such factor as the nuclear receptor Pxr and its human homolog SXR. Xie et al. (2000) showed that targeted disruption of the mouse Pxr gene abolished induction of CYP3A by prototypic inducers such as dexamethasone or pregnenolone-16- α -carbonitrile. In Pxr-null mice carrying a transgene for an activated form of human SXR, there was constitutive upregulation of CYP3A gene expression and en-

hanced protection against toxic xenobiotic compounds. Xie et al. (2000) demonstrated that species origin of the receptor, rather than the promoter structure of the CYP3A genes, dictates the species-specific pattern of CYP3A inducibility. Thus, they could generate 'humanized' transgenic mice that were responsive to human-specific inducers such as the antibiotic rifampicin. Xie et al. (2000) concluded that the SXR/Pxr genes encode the primary species-specific xenosensors that mediate the adaptive hepatic response, and may represent the critical biochemical mechanism of human xenoprotection.

[17564] It is appreciated that the abovementioned animal model for NR1I2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[17565] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17566] Lehmann, J. M.; McKee, D. D.; Watson, M. A.; Willson, T. M.; Moore, J. T.; Kliewer, S. A. : The human orphan nuclear receptor PXR is activated by compounds that regulate CYP3A4 gene expression and cause drug interactions. J. Clin. Invest. 102: 1016–1023, 1998. ; and

[17567] Xie, W.; Barwick, J. L.; Downes, M.; Blumberg, B.; Simon, C. M.; Nelson, M. C.; Neuschwander-Tetri, B. A.; Brunt, E. M.; Guzelian, P. S.; Evans, R. M. : Humanized xenobiotic response in.

[17568] Further studies establishing the function and utilities of NR1I2 are found in John Hopkins OMIM database record ID 603065, and in cited publications numbered 8483–8484, 3423, 3882, 848 and 8577 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 21 (prostaglandin transporter), Member 2 (SLC21A2, Accession NM_005630) is another VGAM336 host target gene. SLC21A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC21A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC21A2 BINDING SITE, designated SEQ ID:12156, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17569] Another function of VGAM336 is therefore inhibition of Solute Carrier Family 21 (prostaglandin transporter), Member 2 (SLC21A2, Accession NM_005630), a gene

which is a Prostaglandin transporter. Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC21A2. The function of SLC21A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM83. BCAA (Accession NM_016374) is another VGAM336 host target gene. BCAA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCAA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCAA BINDING SITE, designated SEQ ID:18513, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17570] Another function of VGAM336 is therefore inhibition of BCAA (Accession NM_016374). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCAA. Chromosome 20 Open Reading Frame 139 (C20orf139, Accession XM_097749) is another VGAM336 host target gene. C20orf139 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by C20orf139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf139 BINDING SITE, designated SEQ ID:41104, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17571] Another function of VGAM336 is therefore inhibition of Chromosome 20 Open Reading Frame 139 (C20orf139, Accession XM_097749). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf139. Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM_004273) is another VGAM336 host target gene. CHST3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHST3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST3 BINDING SITE, designated SEQ ID:10486, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ

ID:3047.

[17572] Another function of VGAM336 is therefore inhibition of Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM_004273). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST3. DKFZP434D146 (Accession NM_015595) is another VGAM336 host target gene. DKFZP434D146 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434D146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434D146 BINDING SITE, designated SEQ ID:17872, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17573] Another function of VGAM336 is therefore inhibition of DKFZP434D146 (Accession NM_015595). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434D146. DKFZP434H132 (Accession NM_015492) is another VGAM336 host target gene. DKFZP434H132 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by DKFZP434H132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434H132 BINDING SITE, designated SEQ ID:17761, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17574] Another function of VGAM336 is therefore inhibition of DKFZP434H132 (Accession NM_015492). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434H132. FLJ13902 (Accession NM_024653) is another VGAM336 host target gene. FLJ13902 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13902, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13902 BINDING SITE, designated SEQ ID:23951, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17575] Another function of VGAM336 is therefore inhibition of

FLJ13902 (Accession NM_024653). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13902. FLJ14936 (Accession NM_032284) is another VGAM336 host target gene. FLJ14936 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14936 BINDING SITE, designated SEQ ID:26042, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17576] Another function of VGAM336 is therefore inhibition of FLJ14936 (Accession NM_032284). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14936. FLJ20337 (Accession NM_017772) is another VGAM336 host target gene. FLJ20337 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ20337 BINDING SITE, designated SEQ ID:19392, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17577] Another function of VGAM336 is therefore inhibition of FLJ20337 (Accession NM_017772). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20337. FLJ20689 (Accession NM_017972) is another VGAM336 host target gene. FLJ20689 BINDING SITE1 and FLJ20689 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ20689, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20689 BINDING SITE1 and FLJ20689 BINDING SITE2, designated SEQ ID:19702 and SEQ ID:19598 respectively, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17578] Another function of VGAM336 is therefore inhibition of FLJ20689 (Accession NM_017972). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20689.

LBP-9 (Accession NM_014553) is another VGAM336 host target gene. LBP-9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LBP-9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LBP-9 BINDING SITE, designated SEQ ID:15877, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17579] Another function of VGAM336 is therefore inhibition of LBP-9 (Accession NM_014553). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LBP-9. MGC26684 (Accession NM_144568) is another VGAM336 host target gene. MGC26684 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC26684, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC26684 BINDING SITE, designated SEQ ID:29371, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA,

also designated SEQ ID:3047.

[17580] Another function of VGAM336 is therefore inhibition of MGC26684 (Accession NM_144568). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC26684. MGC26744 (Accession NM_144645) is another VGAM336 host target gene. MGC26744 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC26744, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC26744 BINDING SITE, designated SEQ ID:29471, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17581] Another function of VGAM336 is therefore inhibition of MGC26744 (Accession NM_144645). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC26744. Protein Regulator of Cytokinesis 1 (PRC1, Accession NM_003981) is another VGAM336 host target gene. PRC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

PRC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRC1 BINDING SITE, designated SEQ ID:10119, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17582] Another function of VGAM336 is therefore inhibition of Protein Regulator of Cytokinesis 1 (PRC1, Accession NM_003981). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRC1. Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member 2 (SLC11A2, Accession NM_000617) is another VGAM336 host target gene. SLC11A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC11A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC11A2 BINDING SITE, designated SEQ ID:6222, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17583] Another function of VGAM336 is therefore inhibition of

Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member 2 (SLC11A2, Accession NM_000617). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC11A2. VRP (Accession NM_007063) is another VGAM336 host target gene. VRP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by VRP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VRP BINDING SITE, designated SEQ ID:13925, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17584] Another function of VGAM336 is therefore inhibition of VRP (Accession NM_007063). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VRP. LOC112840 (Accession NM_080666) is another VGAM336 host target gene. LOC112840 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC112840, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112840 BINDING SITE, designated SEQ ID:27955, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17585] Another function of VGAM336 is therefore inhibition of LOC112840 (Accession NM_080666). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112840. LOC122970 (Accession XM_058672) is another VGAM336 host target gene. LOC122970 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC122970, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122970 BINDING SITE, designated SEQ ID:36713, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17586] Another function of VGAM336 is therefore inhibition of LOC122970 (Accession XM_058672). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC122970. LOC145955 (Accession XM_096912) is another VGAM336 host target gene. LOC145955 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145955 BINDING SITE, designated SEQ ID:40641, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17587] Another function of VGAM336 is therefore inhibition of LOC145955 (Accession XM_096912). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145955. LOC146481 (Accession XM_085484) is another VGAM336 host target gene. LOC146481 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146481, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146481 BINDING SITE, designated SEQ ID:38174, to the nucleotide sequence of VGAM336 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3047.

[17588] Another function of VGAM336 is therefore inhibition of LOC146481 (Accession XM_085484). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146481. LOC146957 (Accession XM_085652) is another VGAM336 host target gene. LOC146957 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146957 BINDING SITE, designated SEQ ID:38280, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17589] Another function of VGAM336 is therefore inhibition of LOC146957 (Accession XM_085652). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146957. LOC204084 (Accession XM_115181) is another VGAM336 host target gene. LOC204084 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC204084, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204084 BINDING SITE, designated SEQ ID:43083, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17590] Another function of VGAM336 is therefore inhibition of LOC204084 (Accession XM_115181). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204084. LOC253841 (Accession XM_172811) is another VGAM336 host target gene. LOC253841 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253841 BINDING SITE, designated SEQ ID:46091, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17591] Another function of VGAM336 is therefore inhibition of LOC253841 (Accession XM_172811). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC253841. LOC254173 (Accession XM_173022) is another VGAM336 host target gene. LOC254173 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254173 BINDING SITE, designated SEQ ID:46287, to the nucleotide sequence of VGAM336 RNA, herein designated VGAM RNA, also designated SEQ ID:3047.

[17592] Another function of VGAM336 is therefore inhibition of LOC254173 (Accession XM_173022). Accordingly, utilities of VGAM336 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254173. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 337 (VGAM337) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17593] VGAM337 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM337 was detected is described hereinabove with reference to Figs. 1–8.

[17594] VGAM337 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM337 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17595] VGAM337 gene encodes a VGAM337 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM337 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM337 precursor RNA is designated SEQ ID:323, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:323 is located at position 22516 relative to the genome of Saimiriine Herpesvirus 2.

[17596] VGAM337 precursor RNA folds onto itself, forming VGAM337 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17597] An enzyme complex designated DICER COMPLEX, `dices` the VGAM337 folded precursor RNA into VGAM337 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM337 RNA is designated SEQ ID:3048, and is provided hereinbelow with reference to the sequence listing part.

[17598] VGAM337 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM337 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM337 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17599] VGAM337 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM337 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM337 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM337 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM337 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17600] The complementary binding of VGAM337 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM337 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM337 host target RNA into VGAM337 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17601] It is appreciated that VGAM337 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM337 host target genes. The mRNA of each one of this plurality of VGAM337 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM337 RNA, herein designated VGAM RNA, and which when bound by VGAM337 RNA causes inhibition of translation of respective one or more VGAM337 host target proteins.

[17602] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM337 gene, herein designated VGAM GENE, on one or more VGAM337 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17603] It is yet further appreciated that a function of VGAM337 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM337 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM337 correlate with, and may be deduced from, the identity of the host target genes which VGAM337 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17604] Nucleotide sequences of the VGAM337 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM337 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM337 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM337 are further described hereinbelow with reference to Table 1.

[17605] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM337 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM337 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17606] As mentioned hereinabove with reference to Fig. 1, a function of VGAM337 gene, herein designated VGAM is inhibition of expression of VGAM337 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM337 correlate with, and may be deduced from, the identity of the target genes which VGAM337 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17607] Copine III (CPNE3, Accession NM_003909) is a VGAM337 host target gene. CPNE3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by CPNE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPNE3 BINDING SITE, designated SEQ ID:9997, to the nucleotide sequence of VGAM337 RNA, herein designated VGAM RNA, also designated SEQ ID:3048.

[17608] A function of VGAM337 is therefore inhibition of Copine III (CPNE3, Accession NM_003909), a gene which may function in membrane trafficking. Accordingly, utilities of VGAM337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPNE3. The function of CPNE3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM28. Dystonia 1, Torsion (autosomal dominant; torsin A) (DYT1, Accession NM_000113) is another VGAM337 host target gene. DYT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DYT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DYT1 BINDING SITE,

designated SEQ ID:5577, to the nucleotide sequence of VGAM337 RNA, herein designated VGAM RNA, also designated SEQ ID:3048.

[17609] Another function of VGAM337 is therefore inhibition of Dystonia 1, Torsion (autosomal dominant; torsin A) (DYT1, Accession NM_000113). Accordingly, utilities of VGAM337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DYT1. UDP-N-acetyl-alpha-D-galactosamine:(N-acetylneuraminyl)-galactosylglucosylceramide N-acetylgalactosaminyltransferase (GalNAc-T) (GALGT, Accession NM_001478) is another VGAM337 host target gene. GALGT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GALGT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALGT BINDING SITE, designated SEQ ID:7214, to the nucleotide sequence of VGAM337 RNA, herein designated VGAM RNA, also designated SEQ

ID:3048.

[17610] Another function of VGAM337 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:(N-acetylneuraminyl)-galactosylglucosylceramide N-acetylgalactosaminyltransferase (GalNAc-T) (GALGT, Accession NM_001478), a gene which is involved in the biosynthesis of gangliosides gm2, gd2 and ga2. Accordingly, utilities of VGAM337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALGT. The function of GALGT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179. Reticulon 1 (RTN1, Accession NM_021136) is another VGAM337 host target gene. RTN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RTN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of RTN1 BINDING SITE, designated SEQ ID:22110, to the nucleotide sequence of VGAM337 RNA, herein designated VGAM RNA, also designated SEQ ID:3048.

[17611] Another function of VGAM337 is therefore inhibition of Reticulon 1 (RTN1, Accession NM_021136), a gene which may be involved in neuroendocrine secretion or in membrane – membrane trafficking in neuroendocrine cells. Accordingly, utilities of VGAM337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RTN1. The function of RTN1 has been established by previous studies. Roebroek et al. (1993) described the cloning of a gene that encodes a group of neuroendocrine-specific proteins and which they designated NSP. The original cDNA was identified by screening an expression library of the small-cell lung cancer (SCLC) NCI-H82 cell line with antibodies to the previously identified proteins. The gene can produce 3 different transcripts (3.4, 2.3, and 1.8 kb), which are identical at their 3-prime ends but have unique amino termini. The common carboxyl-terminal region contains 2 large hydrophobic domains. The largest cDNA (NSP-A) produces a 135-kD (776-amino acid) protein which is rich in proline and serine residues and contains multiple potential phosphoryla-

tion sites. NSP-B and NSP-C have predicted reading frames of 356 and 208 amino acids, respectively. The B transcript is found only in the NCI-H82 cell line. NSP-specific antibodies showed that the proteins are localized to membranes of the endoplasmic reticulum (Senden et al., 1994), leading to their proposed designation as 'reticulons.' Immunohistochemical studies in the rat (van de Velde et al., 1994) showed the presence of NSP-A protein in many regions of the brain. NSP-A or -C transcripts were found in 18 different SCLC lines but not in any of 11 nonendocrine non-SCLCs (van de Velde et al., 1994). Kools et al. (1994) mapped the human NSP gene to 14q21-q22 by fluorescence in situ hybridization Roebroek et al. (1996) found that the NSP exons are dispersed over a genomic region of about 275 kb. The genomic organization explained the generation of NSP mRNA variants encoding NSP protein isoforms. Multiple promoters rather than alternative splicing of internal exons seemed to be involved in this diversity. Comparison of NSP genomic and cDNA sequences with databank nucleotide sequences resulted in the discovery of other human members of this novel family of reticulon encoding genes

[17612] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [17615] Further studies establishing the function and utilities of RTN1 are found in John Hopkins OMIM database record ID 600865, and in cited publications numbered 7016-7021 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Secreted Frizzled-related Protein 1 (SFRP1, Accession NM_003012) is another VGAM337 host target gene. SFRP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRP1 BIND-

ING SITE, designated SEQ ID:8934, to the nucleotide sequence of VGAM337 RNA, herein designated VGAM RNA, also designated SEQ ID:3048.

[17616] Another function of VGAM337 is therefore inhibition of Secreted Frizzled-related Protein 1 (SFRP1, Accession NM_003012), a gene which is a receptor for wnt proteins that may have an anti-apoptotic function. Accordingly, utilities of VGAM337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRP1. The function of SFRP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM250. Calneuron 1 (CALN1, Accession NM_031468) is another VGAM337 host target gene. CALN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALN1 BINDING SITE, designated SEQ ID:25514, to the nucleotide sequence of VGAM337 RNA, herein designated VGAM RNA, also designated SEQ ID:3048.

[17617] Another function of VGAM337 is therefore inhibition of Calneuron 1 (CALN1, Accession NM_031468). Accordingly, utilities of VGAM337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALN1. DNAM-1 (Accession NM_006566) is another VGAM337 host target gene. DNAM-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNAM-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAM-1 BINDING SITE, designated SEQ ID:13341, to the nucleotide sequence of VGAM337 RNA, herein designated VGAM RNA, also designated SEQ ID:3048.

[17618] Another function of VGAM337 is therefore inhibition of DNAM-1 (Accession NM_006566). Accordingly, utilities of VGAM337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAM-1. EZFIT (Accession NM_021216) is another VGAM337 host target gene. EZFIT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EZFIT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of EZFIT BINDING SITE, designated SEQ ID:22198, to the nucleotide sequence of VGAM337 RNA, herein designated VGAM RNA, also designated SEQ ID:3048.

[17619] Another function of VGAM337 is therefore inhibition of EZFIT (Accession NM_021216). Accordingly, utilities of VGAM337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EZFIT. KIAA1500 (Accession XM_034353) is another VGAM337 host target gene. KIAA1500 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1500, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1500 BINDING SITE, designated SEQ ID:32065, to the nucleotide sequence of VGAM337 RNA, herein designated VGAM RNA, also designated SEQ ID:3048.

[17620] Another function of VGAM337 is therefore inhibition of KIAA1500 (Accession XM_034353). Accordingly, utilities of VGAM337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1500. SEF (Accession XM_045300) is another VGAM337 host target gene. SEF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEF BINDING SITE, designated SEQ ID:34426, to the nucleotide sequence of VGAM337 RNA, herein designated VGAM RNA, also designated SEQ ID:3048.

[17621] Another function of VGAM337 is therefore inhibition of SEF (Accession XM_045300). Accordingly, utilities of VGAM337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEF. Seizure Related 6 Homolog (mouse) (SEZ6, Accession XM_058869) is another VGAM337 host target gene. SEZ6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEZ6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEZ6 BINDING SITE, designated SEQ ID:36773, to the nucleotide sequence of VGAM337 RNA, herein designated

VGAM RNA, also designated SEQ ID:3048.

[17622] Another function of VGAM337 is therefore inhibition of Seizure Related 6 Homolog (mouse) (SEZ6, Accession XM_058869). Accordingly, utilities of VGAM337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEZ6. LOC221477 (Accession XM_166397) is another VGAM337 host target gene. LOC221477 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221477 BINDING SITE, designated SEQ ID:44260, to the nucleotide sequence of VGAM337 RNA, herein designated VGAM RNA, also designated SEQ ID:3048.

[17623] Another function of VGAM337 is therefore inhibition of LOC221477 (Accession XM_166397). Accordingly, utilities of VGAM337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221477. LOC50999 (Accession NM_016040) is another VGAM337 host target gene. LOC50999 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC50999, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC50999 BINDING SITE, designated SEQ ID:18116, to the nucleotide sequence of VGAM337 RNA, herein designated VGAM RNA, also designated SEQ ID:3048.

[17624] Another function of VGAM337 is therefore inhibition of LOC50999 (Accession NM_016040). Accordingly, utilities of VGAM337 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC50999. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 338 (VGAM338) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17625] VGAM338 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM338 was detected is described hereinabove with reference to Figs. 1–8.

[17626] VGAM338 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Saimiriine Herpesvirus 2. VGAM338 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17627] VGAM338 gene encodes a VGAM338 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM338 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM338 precursor RNA is designated SEQ ID:324, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:324 is located at position 21425 relative to the genome of Saimiriine Herpesvirus 2.

[17628] VGAM338 precursor RNA folds onto itself, forming VGAM338 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17629] An enzyme complex designated DICER COMPLEX, `dices` the VGAM338 folded precursor RNA into VGAM338 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM338 RNA is designated SEQ ID:3049, and is provided hereinbelow with reference to the sequence listing part.

[17630] VGAM338 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM338 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM338 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17631] VGAM338 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM338 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM338 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM338 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM338 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17632] The complementary binding of VGAM338 RNA, herein designated VGAM RNA, to host target binding sites on VGAM338 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM338 host tar-

get RNA into VGAM338 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17633] It is appreciated that VGAM338 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM338 host target genes. The mRNA of each one of this plurality of VGAM338 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM338 RNA, herein designated VGAM RNA, and which when bound by VGAM338 RNA causes inhibition of translation of respective one or more VGAM338 host target proteins.

[17634] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM338 gene, herein designated VGAM GENE, on one or more VGAM338 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17635] It is yet further appreciated that a function of VGAM338 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM338 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM338 correlate with, and may be deduced from, the identity of the host target genes which VGAM338 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17636] Nucleotide sequences of the VGAM338 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM338 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM338 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM338 are further

described hereinbelow with reference to Table 1.

[17637] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM338 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM338 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17638] As mentioned hereinabove with reference to Fig. 1, a function of VGAM338 gene, herein designated VGAM is inhibition of expression of VGAM338 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM338 correlate with, and may be deduced from, the identity of the target genes which VGAM338 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17639] Nuclear Transcription Factor Y, Gamma (NFYC, Accession NM_014223) is a VGAM338 host target gene. NFYC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NFYC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFYC

BINDING SITE, designated SEQ ID:15492, to the nucleotide sequence of VGAM338 RNA, herein designated VGAM RNA, also designated SEQ ID:3049.

[17640] A function of VGAM338 is therefore inhibition of Nuclear Transcription Factor Y, Gamma (NFYC, Accession NM_014223). Accordingly, utilities of VGAM338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFYC. KIAA0042 (Accession NM_014875) is another VGAM338 host target gene. KIAA0042 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0042 BINDING SITE, designated SEQ ID:17014, to the nucleotide sequence of VGAM338 RNA, herein designated VGAM RNA, also designated SEQ ID:3049.

[17641] Another function of VGAM338 is therefore inhibition of KIAA0042 (Accession NM_014875). Accordingly, utilities of VGAM338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0042. KIAA0322 (Accession XM_166591) is another

VGAM338 host target gene. KIAA0322 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0322 BINDING SITE, designated SEQ ID:44559, to the nucleotide sequence of VGAM338 RNA, herein designated VGAM RNA, also designated SEQ ID:3049.

[17642] Another function of VGAM338 is therefore inhibition of KIAA0322 (Accession XM_166591). Accordingly, utilities of VGAM338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0322. LOC115400 (Accession XM_055880) is another VGAM338 host target gene. LOC115400 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC115400, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115400 BINDING SITE, designated SEQ ID:36348, to the nucleotide sequence of VGAM338 RNA, herein designated VGAM RNA, also designated SEQ ID:3049.

[17643] Another function of VGAM338 is therefore inhibition of LOC115400 (Accession XM_055880). Accordingly, utilities of VGAM338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115400. LOC51701 (Accession NM_016231) is another VGAM338 host target gene. LOC51701 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51701, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51701 BINDING SITE, designated SEQ ID:18346, to the nucleotide sequence of VGAM338 RNA, herein designated VGAM RNA, also designated SEQ ID:3049.

[17644] Another function of VGAM338 is therefore inhibition of LOC51701 (Accession NM_016231). Accordingly, utilities of VGAM338 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51701. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 339 (VGAM339) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[17645] VGAM339 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM339 was detected is described hereinabove with reference to Figs. 1–8.

[17646] VGAM339 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM339 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17647] VGAM339 gene encodes a VGAM339 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM339 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM339 precursor RNA is designated SEQ ID:325, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:325 is located at position 22382 relative to the genome of Saimiriine Herpesvirus 2.

[17648] VGAM339 precursor RNA folds onto itself, forming VGAM339 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional
`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[17649] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM339 folded precursor RNA into VGAM339 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 41%) nucleotide se-
quence of VGAM339 RNA is designated SEQ ID:3050, and
is provided hereinbelow with reference to the sequence
listing part.

[17650] VGAM339 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM339 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM339 host target RNA comprises
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17651] VGAM339 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM339 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM339 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM339 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM339 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17652] The complementary binding of VGAM339 RNA, herein designated VGAM RNA, to host target binding sites on VGAM339 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM339 host target RNA into VGAM339 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17653] It is appreciated that VGAM339 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM339 host target genes. The mRNA of each one of this plurality of VGAM339 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM339 RNA, herein designated VGAM RNA, and which when bound by VGAM339 RNA causes inhibition of translation of respective one or more VGAM339 host target proteins.

[17654] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM339 gene, herein designated VGAM GENE, on one or more VGAM339 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17655] It is yet further appreciated that a function of VGAM339 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM339 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM339 correlate with, and may be deduced from, the identity of the host target genes which VGAM339 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

- [17656] Nucleotide sequences of the VGAM339 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM339 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM339 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM339 are further described hereinbelow with reference to Table 1.
- [17657] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM339 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM339 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [17658] As mentioned hereinabove with reference to Fig. 1, a function of VGAM339 gene, herein designated VGAM is inhibition of expression of VGAM339 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM339 correlate with, and may be deduced from, the identity of the target genes which VGAM339 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17659] Potassium Voltage-gated Channel, KQT-like Subfamily, Member 1 (KCNQ1, Accession NM_000218) is a VGAM339 host target gene. KCNQ1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNQ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNQ1 BINDING SITE, designated SEQ ID:5723, to the nucleotide sequence of VGAM339 RNA, herein designated VGAM RNA, also designated SEQ ID:3050.

[17660] A function of VGAM339 is therefore inhibition of Potassium Voltage-gated Channel, KQT-like Subfamily, Member 1 (KCNQ1, Accession NM_000218), a gene which probably important in cardiac repolarization. associates with kcne1 (mink) to form the i(ks) cardiac potassium current. elicits a rapidly activating, k(+)-selective outward current. muscarinic agonist oxotremorine-m strongly suppresses kcnq1/kcne1 current in cho cells in which cloned kcnq1/kcne1 channels were coexpressed with m1 muscarinic receptors. may associate also with kcne3 (mirp2) to form the potassium channel that is important for cyclic amp-stimulated intestinal secretion of chloride

io TISSUE:abondantly expressed in heart, pancreas, prostate, kidney, small intestine and peripheral blood leukocytes. less abondant in placenta, lung, spleen, colon, thymus, testis and ovaries. Accordingly, utilities of VGAM339 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNQ1. The function of KCNQ1 has been established by previous studies. Congenital long QT syndrome (LQTS) is electrocardiographically characterized by a prolonged QT interval and polymorphic ventricular arrhythmias (torsade de pointes). These cardiac arrhythmias may result in recurrent syncope, seizure, or sudden death. Mutation in the KCNQ1 gene can cause either Romano-Ward syndrome or Jervell and Lange-Nielsen syndrome (OMIM Ref. No. 220400). The candidate gene approach had been used to identify genes responsible for long QT syndrome on chromosome 7 (OMIM Ref. No. 152427) and chromosome 3 (OMIM Ref. No. 600163). Wang et al. (1996) used positional cloning methods to establish a gene, which they called KVLQT1, as the chromosome 11-linked LQT1 gene. KVLQT1 is strongly expressed in the heart and codes a protein with structural features of a voltage-gated potassium channel. The longest open reading frame of the

KVLQT1 cDNA spans 1,645 bp. The authors found KVLQT1 mutations in affected members of 16 arrhythmia families, including 1 intragenic deletion and 10 different missense mutations (e.g., 192500.0001). Marx et al. (2002) demonstrated that beta-adrenergic receptor modulation of the slow outward potassium ion current (I-KS) requires targeting of cAMP-dependent protein kinase A (OMIM Ref. No. 188830) and protein phosphatase 1 (PP1; e.g., 176875) to KCNQ1 through the targeting protein yotiao (OMIM Ref. No. 604001). Yotiao binds to KCNQ1 by a leucine zipper motif, which is disrupted by an LQTS mutation (KCNQ1-G589D; 192500.0029). Identification of the KCNQ1 macromolecular complex provides a mechanism for sympathetic nervous system modulation of cardiac action potential duration through I-KS. Animal model experiments lend further support to the function of KCNQ1. To produce a mouse model for Jervell and Lange-Nielsen syndrome, Casimiro et al. (2001) generated a line of transgenic mice that had a targeted disruption in the Kcnq1 gene. Behavioral analysis demonstrated that the homozygous null mice were deaf and exhibited a shaker-waltzer phenotype. Histologic analysis of the inner ear structures of these mice showed gross morphologic

anomalies because of drastic reduction in the volume of endolymph. ECGs recorded from the null mice demonstrated abnormal T- and P-wave morphologies and prolongation of the QT and JT intervals when measured in vivo, but not in isolated hearts. These changes were indicative of cardiac repolarization defects that appear to be induced by extracardiac signals.

[17661] It is appreciated that the abovementioned animal model for KCNQ1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[17662] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17663] Marx, S. O.; Kurokawa, J.; Reiken, S.; Motoike, H.; D'Armiento, J.; Marks, A. R.; Kass, R. S. : Requirement of a macromolecular signaling complex for beta adrenergic receptor modulation of the KCNQ1-KCNE1 potassium channel. Science 295: 496-499, 2002. ; and

[17664] Casimiro, M. C.; Knollmann, B. C.; Ebert, S. N.; Vary, J. C., Jr.; Greene, A. E.; Franz, M. R.; Grinberg, A.; Huang, S. P.; Pfeifer, K. : Targeted disruption of the Kcnq1 gene produces.

[17665] Further studies establishing the function and utilities of KCNQ1 are found in John Hopkins OMIM database record ID 192500, and in cited publications numbered 5747-5749, 10835-5774, 1498, 2199-2200, 1497, 1499-1513, 10836-1522, 5777, 6058-6061, 2209, 2210, 6062-6067, 10837-6075, 2216, 6076-781, 4332-78 and 2222 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Prostaglandin I₂ (prostacyclin) Synthase (PTGIS, Accession NM_000961) is another VGAM339 host target gene. PTGIS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTGIS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGIS BINDING SITE, designated SEQ ID:6667, to the nucleotide sequence of VGAM339 RNA, herein designated VGAM RNA, also designated SEQ ID:3050.

[17666] Another function of VGAM339 is therefore inhibition of Prostaglandin I₂ (prostacyclin) Synthase (PTGIS, Accession NM_000961), a gene which catalyzes the isomerization of prostaglandin h₂ to prostacyclin (= prostaglandin i₂). Accordingly, utilities of VGAM339 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with PTGIS. The function of PTGIS and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM206. HSPC065 (Accession NM_014157) is another VGAM339 host target gene. HSPC065 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPC065, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC065 BINDING SITE, designated SEQ ID:15450, to the nucleotide sequence of VGAM339 RNA, herein designated VGAM RNA, also designated SEQ ID:3050.

[17667] Another function of VGAM339 is therefore inhibition of HSPC065 (Accession NM_014157). Accordingly, utilities of VGAM339 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC065. LOC148760 (Accession XM_097514) is another VGAM339 host target gene. LOC148760 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148760, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148760 BINDING SITE, designated SEQ ID:40898, to the nucleotide sequence of VGAM339 RNA, herein designated VGAM RNA, also designated SEQ ID:3050.

[17668] Another function of VGAM339 is therefore inhibition of LOC148760 (Accession XM_097514). Accordingly, utilities of VGAM339 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148760. LOC221773 (Accession XM_165802) is another VGAM339 host target gene. LOC221773 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221773, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221773 BINDING SITE, designated SEQ ID:43761, to the nucleotide sequence of VGAM339 RNA, herein designated VGAM RNA, also designated SEQ ID:3050.

[17669] Another function of VGAM339 is therefore inhibition of LOC221773 (Accession XM_165802). Accordingly, utilities of VGAM339 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC221773. LOC51696 (Accession NM_016217) is another VGAM339 host target gene. LOC51696 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51696 BINDING SITE, designated SEQ ID:18310, to the nucleotide sequence of VGAM339 RNA, herein designated VGAM RNA, also designated SEQ ID:3050.

[17670] Another function of VGAM339 is therefore inhibition of LOC51696 (Accession NM_016217). Accordingly, utilities of VGAM339 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51696. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 340 (VGAM340) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17671] VGAM340 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM340 was detected is described hereinabove with reference to Figs. 1–8.

[17672] VGAM340 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tobacco Mosaic Virus. VGAM340 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17673] VGAM340 gene encodes a VGAM340 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM340 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM340 precursor RNA is designated SEQ ID:326, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:326 is located at position 3101 relative to the genome of Tobacco Mosaic Virus.

[17674] VGAM340 precursor RNA folds onto itself, forming VGAM340 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17675] An enzyme complex designated DICER COMPLEX, `dices` the VGAM340 folded precursor RNA into VGAM340 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM340 RNA is designated SEQ ID:3051, and is provided hereinbelow with reference to the sequence listing part.

[17676] VGAM340 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM340 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM340 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17677] VGAM340 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM340 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM340 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM340 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM340 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17678] The complementary binding of VGAM340 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM340 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM340 host target RNA into VGAM340 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17679] It is appreciated that VGAM340 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM340 host target genes. The mRNA of each one of this plurality of VGAM340 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM340 RNA, herein designated VGAM RNA, and which when bound by VGAM340 RNA causes inhibition of translation of respective one or more VGAM340 host target proteins.

[17680] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM340 gene, herein designated VGAM GENE, on one or more VGAM340 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17681] It is yet further appreciated that a function of VGAM340 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of viral infection by Tobacco Mosaic Virus. Specific functions, and accordingly utilities, of VGAM340 correlate with, and may be deduced from, the identity of the host target genes which VGAM340 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17682] Nucleotide sequences of the VGAM340 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM340 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM340 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM340 are further described hereinbelow with reference to Table 1.

[17683] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM340 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM340 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17684] As mentioned hereinabove with reference to Fig. 1, a function of VGAM340 gene, herein designated VGAM is inhibition of expression of VGAM340 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM340 correlate with, and may be deduced from, the identity of the target genes which VGAM340 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17685] Aquaporin 6, Kidney Specific (AQP6, Accession NM_053286) is a VGAM340 host target gene. AQP6 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by AQP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AQP6 BINDING SITE, designated SEQ ID:27610, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:3051.

[17686] A function of VGAM340 is therefore inhibition of Aquaporin 6, Kidney Specific (AQP6, Accession NM_053286), a gene which participates in distinct physiologic function such as glomerular filtration, tubular endocytosis, and acid-base metabolism. Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP6. The function of AQP6 has been established by previous studies. Ma et al. (1997), who referred to this gene as aquaporin-6 (AQP6), demonstrated that, among the 7 human aquaporins cloned to that time (AQPs 0 to 6), the genes encoding the 4 most closely related aquaporins all mapped to 12q13: AQP0, AQP2, AQP5 (OMIM Ref. No. 600442), and AQP6. To construct a physical map and identify novel aquaporin gene members of this cluster, Ma et al. (1997) screened a human CEPH B YAC library by PCR using

primers derived from exon 4 of the AQP2 and AQP0 genes. A YAC clone with 200 kb of human DNA was isolated and analyzed. Primary pulsed field gel electrophoresis and Southern blot analysis indicated the presence of AQP2, AQP5, and AQP6 genes, but not AQP0. Restriction mapping and PCR analysis yielded a precise physical map in which the 3 aquaporin genes spanned only approximately 27 kb with the order, transcription orientation, and spacer length as follows: 5-prime--AQP2--5kb spacer--AQP5--7kb spacer--AQP6--3-prime. Yasui et al. (1999) showed that AQP6 is localized exclusively in intracellular membranes in renal epithelia. Sequential ultracentrifugation of rat kidney homogenates confirmed that AQP6 resides predominantly in vesicular fractions, and immunohistochemical and immunoelectron microscopic studies confirmed that more than 98% of AQP6 is located in intracellular membrane vesicles. In glomeruli, AQP6 is present in membrane vesicles within podocyte cell bodies and foot processes. In proximal tubules, AQP6 is also abundant in membrane vesicles within the subapical compartment of segment 2 and segment 3 cells, but was not detected in the brush border or basolateral membranes. In collecting duct, AQP6 resides in intracellular membrane vesicles in

apical, mid, and basolateral cytoplasm of type A intercalated cells, but was not observed in the plasma membrane. Unlike other members of the AQP family, the unique distribution in intracellular membrane vesicles in multiple types of renal epithelia indicated that AQP6 is not simply involved in transcellular fluid absorption. These studies predicted that AQP6 participates in distinct physiologic function such as glomerular filtration, tubular endocytosis, and acid-base metabolism.

[17687] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17688] Ma, T.; Yang, B.; Umenishi, F.; Verkman, A. S. : Closely spaced tandem arrangement of AQP2, AQP5, and AQP6 genes in a 27-kilobase segment at chromosome locus 12q13. *Genomics* 43: 387–389, 1997. ; and

[17689] Yasui, M.; Kwon, T.-H.; Knepper, M. A.; Nielsen, S.; Agre, P. : Aquaporin-6: an intracellular vesicle water channel protein in renal epithelia. *Proc. Nat. Acad. Sci.* 96: 5808–5813, 1999.

[17690] Further studies establishing the function and utilities of AQP6 are found in John Hopkins OMIM database record ID 601383, and in cited publications numbered 717 and

7178 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Microtubule-associated Protein, RP/EB Family, Member 3 (MAPRE3, Accession NM_012326) is another VGAM340 host target gene. MAPRE3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAPRE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPRE3 BINDING SITE, designated SEQ ID:14717, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:3051.

[17691] Another function of VGAM340 is therefore inhibition of Microtubule-associated Protein, RP/EB Family, Member 3 (MAPRE3, Accession NM_012326), a gene which interact with cytoplasmic microtubules, and with the adenomatous polyposis coli. Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPRE3. The function of MAPRE3 has been established by previous studies. EB1 family proteins (e.g., MAPRE1; 603108) interact with cytoplasmic microtubules in interphase cells, with mitotic

spindles, and with the adenomatous polyposis coli (APC; 175100) tumor suppressor gene. Using a yeast 2-hybrid screen with the C terminus of APC-like (APCL) as bait, Nakagawa et al. (2000) isolated a cDNA encoding MAPRE3, which they termed EB3. The predicted 282-amino acid protein is 54% identical to MAPRE1. Northern blot analysis revealed expression of a 2.2-kb transcript predominantly in brain and muscle. GST pull-down analysis determined that a homologous region in the C termini of APC and APCL binds to MAPRE3. Immunofluorescence and confocal microscopy demonstrated that MAPRE3 is localized in the microtubule network and colocalizes with APCL in the perinucleus and microtubule network. By EST database searching, RT-PCR, and screening a fetal brain cDNA library, Su and Qi (2001) isolated a cDNA encoding a protein identical to the EB3 protein reported by Nakagawa et al. (2000), which they termed EBF3, and an alternative transcript encoding a 266-amino acid protein. RT-PCR and Western blot analyses indicated that both transcripts are ubiquitously expressed. Genomic sequence analysis showed that there are most likely 3 MAPRE genes: MAPRE1 encodes EB1; MAPRE2 (OMIM Ref. No. 605789) encodes RP1 and the EB2 fragment; and MAPRE3 encodes EBF3 and

the fragment RP3. MAPRE3, like MAPRE1 and MAPRE2, contains 7 exons, but the coding region of MAPRE3 spans only 4.2 kb due to relatively short introns. Western blot analysis detected expression of both isoforms as approximately 32-kD proteins in most cell lines tested. Binding analysis determined that both isoforms interact with APC. By FISH, Nakagawa et al. (2000) mapped the MAPRE3 gene to 2p23.3–p23.1. Using radiation hybrid analysis, Su and Qi (2001) mapped the MAPRE3 gene to 2p23.3–p23.2, where it is closely linked and proximal to the ketohexokinase gene (OMIM Ref. No. 229800).

[17692] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17693] Nakagawa, H.; Koyama, K.; Murata, Y.; Morito, M.; Akiyama, T.; Nakamura, Y. : EB3, a novel member of the EB1 family preferentially expressed in the central nervous system, binds to a CNS-specific APC homologue. *Onco-gene* 19: 210–216, 2000. ; and

[17694] Su, L.-K.; Qi, Y. : Characterization of human MAPRE genes and their proteins. *Genomics* 71: 143–149, 2001.

[17695] Further studies establishing the function and utilities of MAPRE3 are found in John Hopkins OMIM database record

ID 605788, and in cited publications numbered 628 and 8578 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RAB23, Member RAS Oncogene Family (RAB23, Accession NM_016277) is another VGAM340 host target gene. RAB23 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB23 BINDING SITE, designated SEQ ID:18401, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:3051.

[17696] Another function of VGAM340 is therefore inhibition of RAB23, Member RAS Oncogene Family (RAB23, Accession NM_016277), a gene which is involved in the regulation of intracellular membrane trafficking. Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB23. The function of RAB23 has been established by previous studies. Rab proteins are small GTPases of the Ras superfamily involved in the regulation of intracellular membrane trafficking. For additional background information

on Rab proteins, see 179508. The RAB23 gene encodes an essential negative regulator of the Sonic hedgehog (SHH; 600725) signaling pathway. Animal model experiments lend further support to the function of RAB23. Mouse embryos homozygous for mutations in the 'open brain' (opb) gene die during the second half of gestation, with an open neural tube in the head and spinal cord, abnormal somites, polydactyly, and poorly developed eyes. The opb1 allele encodes a lys-to-ter mutation at codon 39; the opb2 allele encodes an arg-to-ter mutation at codon 80. These alleles would lack the domains required for guanine nucleotide and Rab effector binding and are therefore null alleles.

[17697] It is appreciated that the abovementioned animal model for RAB23 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[17698] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17699] Eggenschwiler, J. T.; Espinoza, E.; Anderson, K. V. : Rab23 is an essential negative regulator of the mouse Sonic hedgehog signalling pathway. Nature 412: 194–198,

2001. ; and

[17700] Zhang, Q.-H.; Ye, M.; Wu, X.-Y.; Ren, S.-X.; Zhao, M.; Zhao, C.-J.; Fu, G.; Shen, Y.; Fan, H.-Y.; Lu, G.; Zhong, M.; Xu, X.-R.; and 9 others : Cloning and functional analysis of cDNAs w.

[17701] Further studies establishing the function and utilities of RAB23 are found in John Hopkins OMIM database record ID 606144, and in cited publications numbered 6472-6473 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Apolipoprotein L, 4 (APOL4, Accession NM_030643) is another VGAM340 host target gene. APOL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APOL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOL4 BINDING SITE, designated SEQ ID:24976, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:3051.

[17702] Another function of VGAM340 is therefore inhibition of Apolipoprotein L, 4 (APOL4, Accession NM_030643). Accordingly, utilities of VGAM340 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with APOL4. DKFZP564G092 (Accession NM_015601) is another VGAM340 host target gene. DKFZP564G092 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP564G092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564G092 BINDING SITE, designated SEQ ID:17876, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:3051.

[17703] Another function of VGAM340 is therefore inhibition of DKFZP564G092 (Accession NM_015601). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564G092. FLJ00001 (Accession XM_088525) is another VGAM340 host target gene. FLJ00001 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ00001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

FLJ00001 BINDING SITE, designated SEQ ID:39771, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:3051.

[17704] Another function of VGAM340 is therefore inhibition of FLJ00001 (Accession XM_088525). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00001. FLJ10846 (Accession NM_018241) is another VGAM340 host target gene. FLJ10846 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10846, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10846 BINDING SITE, designated SEQ ID:20200, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:3051.

[17705] Another function of VGAM340 is therefore inhibition of FLJ10846 (Accession NM_018241). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10846. FLJ11539 (Accession NM_024748) is another VGAM340 host target gene. FLJ11539 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ11539, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11539 BINDING SITE, designated SEQ ID:24088, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:3051.

[17706] Another function of VGAM340 is therefore inhibition of FLJ11539 (Accession NM_024748). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11539. Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 2 (GGA2, Accession NM_138640) is another VGAM340 host target gene. GGA2 BINDING SITE1 and GGA2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GGA2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGA2 BINDING SITE1 and GGA2 BINDING SITE2, designated SEQ ID:28922 and SEQ ID:17401 respectively, to the nucleotide sequence of VGAM340 RNA,

herein designated VGAM RNA, also designated SEQ ID:3051.

[17707] Another function of VGAM340 is therefore inhibition of Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 2 (GGA2, Accession NM_138640). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGA2. KIAA1546 (Accession XM_042301) is another VGAM340 host target gene. KIAA1546 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1546, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1546 BINDING SITE, designated SEQ ID:33712, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:3051.

[17708] Another function of VGAM340 is therefore inhibition of KIAA1546 (Accession XM_042301). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1546. Lysyl Oxidase-like 4 (LOXL4, Accession NM_032211) is another VGAM340 host target gene.

LOXL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOXL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOXL4 BINDING SITE, designated SEQ ID:25928, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:3051.

[17709] Another function of VGAM340 is therefore inhibition of Lysyl Oxidase-like 4 (LOXL4, Accession NM_032211). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOXL4. Serine/threonine Kinase 17b (apoptosis-inducing) (STK17B, Accession NM_004226) is another VGAM340 host target gene. STK17B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by STK17B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK17B BINDING SITE, designated SEQ ID:10421, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM

RNA, also designated SEQ ID:3051.

[17710] Another function of VGAM340 is therefore inhibition of Serine/threonine Kinase 17b (apoptosis-inducing) (STK17B, Accession NM_004226). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK17B. TUSP (Accession NM_020245) is another VGAM340 host target gene. TUSP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TUSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUSP BINDING SITE, designated SEQ ID:21518, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:3051.

[17711] Another function of VGAM340 is therefore inhibition of TUSP (Accession NM_020245). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUSP. LOC169611 (Accession XM_095809) is another VGAM340 host target gene. LOC169611 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of
